PREFACE

In the present volume—the thirteenth of the new series which began in 1907, and the eighteenth since the work was originally undertaken in 1898—the following articles may be mentioned as among those most likely to be useful for reference in discussions arising during the coming year: WAR OF THE NATIONS; WAR FINANCE; FRANCE; GREAT BRITAIN; GERMANY; RUSSIA; SOCIALISM; INDUSTRIAL RECONSTRUCTION; the groups of articles dealing with labor subjects, agriculture, industries, and applied science, including CHEMISTRY, INDUSTRIAL; AERONAUTICS; SHIPPING; SHIPBUILDING; topics in ENGINEERING; MILITARY PROGRESS; NAVAL PROGRESS, etc. The discussion of controverted questions arising from the Treaty will be found under WAR OF THE NATIONS and in the articles on the countries concerned, along with summaries of the treaties, and other important documents and the text of the Covenant. News throughout the year being wholly at the mercy of propagandism, the facts in regard to controverted international topics were not accessible, and it was necessary to give the opposing versions at some length. The articles on Literature seem to indicate that the war did not diminish the fertility of authors, and in the case of GERMAN LITERATURE, that it did not seriously alter their point of view. The political sections of the article on the UNITED STATES will be found convenient for reference in the Presidential campaign. The antecedents of the present Irish situation are given under the title of *The Irish Question* in the article on GREAT BRITAIN.

FRANK MOORE COLBY.

EDITOR
FRANK MOORE COLBY, M.A.
LIST OF CONTRIBUTORS

AGRICULTURE, BOTANY, FOOD, FORESTRY, HORTICULTURE, IRRIGATION, ETC.

EDWIN WEST ALLEN, PH.D.,
UNITED STATES DEPARTMENT OF AGRICULTURE,
AND
ALFRED CHARLES TRUE, PH.D.,
UNITED STATES DEPARTMENT OF AGRICULTURE;
ALVIN DILLE (AGRICULTURAL EDUCATION);
WALTER H. EVANS, PH.D. (BOTANY AND
PLANT DISEASES); JOHN I. SCHULTE (CROP
PRODUCTION); CARL W. LARSON (DAIRY-
ING); WALTER H. BEAL (FERTILIZERS AND
SOILS); HOWARD L. KNIGHT (FOOD AND
NUTRITION); AGRICULTURAL LEGISLATION);
EDWIN J. GLASSON (HORTICULTURE AND
FORESTRY); RAY P. TEELE (RECLAMATION);
GEORGE M. ROMMEL (STOCK RAISING);
WILLIAM A. HOOKER (VETERINARY MED-
ICINE); AND A. B. ADAMS OF THE BUREAU OF
INTERNAL REVENUE (LIQUORS).

ANTHROPOLOGY (WITH ETHNOLOGY)

ROBERT H. LOWIE, PH.D.,
AMERICAN MUSEUM OF NATURAL HISTORY,
AND
CLARK WISSLER, PH.D.,
AMERICAN MUSEUM OF NATURAL HISTORY.

ARCHÆOLOGY

OLIVER SAMUEL TONKS, PH.D.,
PROFESSOR OF ART, VASSAR COLLEGE.

ARCHITECTURE

C. MATLACK PRICE,
FORMERLY EDITOR OF THE *Architectural Record*.

ASTRONOMY, METEOROLOGY

C. FITZHUGH TALMAN,
UNITED STATES WEATHER BUREAU.

CHEMISTRY (GENERAL)

E. B. MILLARD, PH.D.,
ASSISTANT PROFESSOR OF PHYSICAL CHEMISTRY,
MASSACHUSETTS INSTITUTE OF TECHNOLOGY.

CHEMISTRY (INDUSTRIAL); EXPOSITIONS; CELEBRATIONS

MARCUS BENJAMIN, PH.D., Sc.D., LL.D.,
EDITOR FOR THE UNITED STATES NATIONAL
MUSEUM.

CIVIL ENGINEERING AND MANUFACTURING SUBJECTS; AERONAUTICS, ETC.

HERBERT TREADWELL WADE,
LATE CAPTAIN, ORDNANCE DEPARTMENT, U. S.
ARMY.

DRAMA (AMERICAN AND ENGLISH)

CLAYTON HAMILTON, M.A.,
DRAMATIC CRITIC OF THE *Bookman*.

**ECONOMIC, SOCIAL AND POLITICAL
SCIENCE SUBJECTS**
EDITORIAL STAFF.

EDUCATION IN THE UNITED STATES

MILO B. HILLEGAS, PH.D.,
COMMISSIONER OF EDUCATION OF VERMONT.

ELECTRICAL ENGINEERING SUBJECTS

REGINALD GORDON,
ASSOCIATE EDITOR OF *Industrial Management*.

**EXPLORATION; POLAR RESEARCH;
ALASKA**

A. W. GREELY, PH.D.,
MAJOR GENERAL, UNITED STATES ARMY; COM-
MANDER GREELY POLAR EXPEDITION.

FRENCH LITERATURE

ALBERT SCHINZ, PH.D.,
PROFESSOR OF FRENCH LITERATURE, SMITH
COLLEGE.

GEOLOGY; MINERALOGY

DAVID HALE NEWLAND, A.B.,
ASSISTANT STATE GEOLOGIST OF NEW YORK.

GERMAN LITERATURE

AMELIA VON ENDE.

**INTERNATIONAL PEACE AND ARBI-
TRATION**

CLINTON ROGERS WOODRUFF, LL.B.,
SECRETARY OF THE NATIONAL MUNICIPAL
LEAGUE AND MEMBER OF THE MOHONK CONFER-
ENCE; FORMERLY PRESIDENT OF THE BOARD OF
PERSONAL REGISTRATION, PHILADELPHIA.

JEWS AND JUDAISM

MEYER WAXMAN, PH.D.,
RABBI, BROOKLYN, N. Y.

**LITERATURE, ENGLISH AND AMERI-
CAN**

DAVID LAMBUTH, A.M.,
PROFESSOR OF ENGLISH, DARTMOUTH COLLEGE.

**LITERATURE (CONTINENTAL): SEE
FRENCH LITERATURE; GERMAN LIT-
ERATURE; ETC.**

MEDICAL SUBJECTS

EDWARD PREBLE, M.D.,
NEW YORK CITY.

MILITARY PROGRESS

C. DEWITT WILLCOX,
COLONEL, U. S. A.; PROFESSOR OF MODERN LAN-
GUAGES, U. S. MILITARY ACADEMY.

MUSIC

ALFRED REMY, M.A.,
EXTENSION LECTURER, COLUMBIA UNIVERSITY,
AND FORMERLY PROFESSOR OF HARMONY AND
COUNTERPOINT, INTERNATIONAL CONSERVATORY,
NEW YORK; EDITOR OF BAKER'S *Biographical
Dictionary of Musicians*.

NAVAL PROGRESS AND RELATED SUB- JECTS

LEWIS SAYRE VAN DUZER,
CAPTAIN, U. S. N., RETIRED; WRITER ON NAVAL
AND NAUTICAL SUBJECTS.

PAINTING AND SCULPTURE

GEORGE KRIEHN, PH.D.,
EXTENSION LECTURER IN THE HISTORY OF ART,
COLUMBIA UNIVERSITY; LECTURER, WOMAN'S
ART SCHOOL, COOPER UNION.

PHILOLOGY (CLASSICAL)

CHARLES KNAPP, PH.D.,
PROFESSOR OF CLASSICAL PHILOLOGY, BARNARD
COLLEGE, COLUMBIA UNIVERSITY.

PHILOLOGY (MODERN)

JOHN LAWRENCE GERIG, PH.D.,
ASSOCIATE PROFESSOR OF CELTIC, EXECUTIVE
OFFICER, DEPARTMENT OF ROMANCE LANGUAGES,
COLUMBIA UNIVERSITY.

PHILOSOPHY

IRVIN EDMAN,
DEPARTMENT OF PHILOSOPHY, COLUMBIA UNI-
VERSITY.

PHYSICS

HENRY D. HUBBARD,
SECRETARY, UNITED STATES BUREAU OF STAND-
ARDS.

PSYCHOLOGY; PSYCHICAL RESEARCH

EDWARD BRADFORD TITCHENER, D.Sc.,
PH.D., LL.D., Litt.D.,
SAGE PROFESSOR OF PSYCHOLOGY, GRADUATE
SCHOOL OF CORNELL UNIVERSITY,
HARRY PORTER WELD, PH.D.,
ASSISTANT PROFESSOR OF PSYCHOLOGY, CORNELL
UNIVERSITY.

RAILWAYS

WILLIAM E. HOOPER
FINANCIAL EDITOR, *Railway Age*.

ROMAN CATHOLIC CHURCH

THOMAS F. MEEHAN,
EDITORIAL STAFF, *America*.

SANITARY ENGINEERING AND MUNIC- IPAL SUBJECTS

MOSES NELSON BAKER, PH.D., C.E.,
ASSOCIATE EDITOR OF THE *Engineering News-
Record*.

SCANDINAVIAN LITERATURE

HARRY V. E. PALMBLAD, A.M.,
PROFESSOR OF MODERN LANGUAGES, CARTIAGE
COLLEGE.

SPANISH LITERATURE

JOHN DRISCOLL FITZ-GERALD, PH.D.,
MEMBER OF THE HISPANIC SOCIETY OF AMERICA;
CORRESPONDING MEMBER OF THE SPANISH ROYAL
ACADEMY, AND OF THE ROYAL ACADEMY OF HIS-
TORY OF MADRID; PROFESSOR OF SPANISH, UNI-
VERSITY OF ILLINOIS.

SPORTS

CHARLES A. TAYLOR,
MEMBER OF THE STAFF OF THE New York
Tribune.

UNITED STATES

IRWIN S. GUERNSEY, M.A.,

UNIVERSITIES AND COLLEGES

MILO B. HILLEGAS, PH.D.,
COMMISSIONER OF EDUCATION OF VERMONT.

WAR OF THE NATIONS

FRANK MOORE COLBY, M.A.,
AND EDITORIAL STAFF.

ZOOLOGY

AARON L. TREADWELL, PH.D.,
PROFESSOR OF BIOLOGY, VASSAR COLLEGE.

THE NEW INTERNATIONAL YEAR BOOK

ABBOTT, CHARLES CONRAD. Naturalist, died at Bristol, Pennsylvania, July 27; well known as the author of many works on natural history. He was born at Trenton, New Jersey, June 4, 1843; graduated at Princeton and made a reputation as a collector of valuable archaeological specimens. He was assistant in the Peabody Museum from 1876 to 1889 and a member of various learned bodies. The list of his writings includes the following: *The Stone Age in New Jersey* (1876); *Primitive Industry* (1881); *A Naturalist's Rambles About Home* (1884); *Upland and Meadow* (1886); *Wasteland Wanderings* (1887); *Days Out of Doors* (1889); *Outings at Odd Times* (1890); *Recent Rambles* (1892); *Travels in a Treetop* (1894); *The Birds About Us* (1894); *Notes of the Night* (1895); *A Colonial Wooing* (novel, 1895); *Birdland Echoes* (1896); *When the Century Was New* (novel, 1897); *The Hermit of Nottingham* (novel, 1897); *The Freedom of the Fields* (1898); *Clear Skies and Cloudy* (1899); *In Nature's Realm* (1900); *Archæological Explorations in the Valley of the Delaware* (1894); *Rambles of an Idler* (1906); *Archæologia Nova Caesarea* (1907, 1908, 1909); *Ten Years' Diggings in Lenâpè Land* (1912).

ABYSSINIA. A North African monarchy lying to the southwest of the Red Sea, and bounded on the west by Sudan, Massaua, the French Somali Coast, and the British Somali protectorate, and on the northwest and south by British East Africa, and the Uganda Protectorate. It has an estimated area of 350,000 square miles and an estimated population of over eight millions. It comprises nine provinces, namely: Harar and dependencies; Wollo, Kassa and Magi; Gore, Tigré; Damot and Gojam; Equatorial provinces: Gondar, and Gima. The independence of Abyssinia was recognized by Italy in the convention of Addis Abeba on October 26, 1896; and the frontiers of the country were determined by treaties with Great Britain in 1902 and 1908, and with Italy in 1908, although in 1919 the Abyssinian government had not yet definitely accepted the delimitation. An important agreement was reached on December 13, 1916, by Great Britain, France, and Italy as to their respective interests in the country. The three Powers agreed to the principle of the open door and to the guaranty by joint action, if necessary, of the safety of their interests. They undertook to preserve the integrity of Abyssinia and to abstain from interference in its internal affairs; and they agreed that any industrial concessions should be made to one of the Powers in

such a manner as not to conflict with the interests of the others. An agreement was also reached in regard to railway construction and in regard to equal treatment of the nationals of the three Powers in trade and transit. They provided for the protection of the zone of the railway built by the French from Jibuti to Diré, and agreed that the French should define the line to Addis Abeba, but stipulated that there should be equal treatment on the line for the three Powers. The British government was to receive a concession for the construction of railways west of Addis Abeba, and Italy for a line from Bena-dir to Eritrea.

The Abyssinians have been Christians since their conversion in the fourth century, and are members of the Alexandrian church under a head bishop or Abuna who is always a Copt, and appointed by the patriarch of Alexandria. Illiteracy prevails, education being confined in general to the clergy. In October, 1907, an edict was passed declaring education compulsory for all male children over the age of twelve, but this has remained a dead letter. Agriculture and grazing are the main pursuits; but though the soil is capable of a fairly varied production, agriculture is backward and few products are extensively cultivated. Cotton, coffee, sugar-cane, dates, and vines are raised to some extent, and minerals abound, including iron, coal, sulphur, copper and silver, but are not extensively worked. In some districts iron is obtained and manufactured into hatchets, knives, and other implements, and gold mining is carried on in many parts of the country. The chief exports are skins, hides, coffee, ivory, wax, civet, gums, spices, gold, rubber, and native butter. The imports comprise manufactures including cotton goods, arms and munitions, liquors, railway material, sugar and petroleum, the imports coming mainly from England, France, India, Italy and the United States. No complete figures for exports and imports are available. The export of coffee into the Sudan was reported to be increasing. The exports through Jibuti in 1917 were reported as follows: Hides, 5,704,423 kilos; coffee, 5,092,647. The exports from Abyssinia to the Sudan were reported for 1917 as follows: coffee £E105,895; wax £E18,265. The total from Sudan in 1917 was reported at £E65,226. The Board of Trade returned the imports from Abyssinia into Great Britain for 1916 at £3330 and the exports to Abyssinia at £3774. The exports from Great Britain to Abyssinia in 1917 were reported at £3833, and in 1918 £13,102.

Coffee is found in parts of the country where

the altitude is from 4500 to 6500 and the production of Harari coffee is reported to be on the increase. This is a long-berry Mocha coffee and besides this there grows wild in southern and western parts of the country an abundant supply of the plant which yields the so-called Abyssinian coffee berry. Primitive conditions of barter still prevail, many articles being used as a medium of exchange, for example, bars of salt and cart-ridges. The unit of currency has been the Maria Theresa dollar to which has lately been added a new coin known as the Menelek dollar of about the same value. Manufactures are but little developed and confined chiefly to coarse cloth, pottery, leather, and iron implements. Means of communication are primitive and transport is carried on by pack-horses, mules, donkeys, and camels, the roads being mere trails. The French railway line from Jibuti to Diré Dawa is 187 miles in length. A new company was formed to complete the line to Addis Abeba in 1909 which had nearly reached completion in 1915. Telegraph lines connect the capital with Harar and with Jibuti in French Somaliland and with Massaua in Eritrea, having a total length of about 1056 miles.

The country is under practically a feudal régime, the soil theoretically belonging to the Negus (emperor). The notion of land as private property scarcely exists. The strength of the army is placed at 250,000 men. After the death of Menelek in December, 1913, his grandson, Lidj Yasu, succeeded, but was deposed September 27, 1916, and succeeded by his aunt, Ouizero Zeoditu (or Waizero Zauditu), born 1876, who was crowned at Addis Abeba, February 11, 1917. The Ras Tafari was proclaimed regent and heir to the throne. The new government was recognized by Great Britain. During 1917, -18, and -19, conditions of civil war were reported.

ACADEMY, FRENCH (ACADÉMIE FRANÇAISE). The oldest, and officially considered the highest of the five academies constituting the Institute of France; founded in 1635 by Cardinal Richelieu. It was reorganized in 1816, and has been recognized as an arbiter in literary questions. Its forty members, known as the Forty Immortals, are for the most part distinguished men of letters, but among them are found men eminent in public service, such as M. Clemenceau and Marshals Joffre and Foch. In 1919 the Academy was still at work upon its monumental dictionary with which it has been associated from the beginning. In fact the Academy's work upon it goes back to the year of foundation, for it made a decision on March 20, 1634, to undertake a dictionary which should assure the purity of the French language. Work did not begin on it, however, until December 14, 1637. The editions of the dictionary were seven in number as follows: 1694, 1718, 1740, 1762, 1793, 1835, and 1878. The edition upon which the Academy was at work in 1919, accordingly, was the eighth, and in the autumn of that year it had proceeded as far as the letter F. In 1919 Pierre Masson was elected permanent secretary in place of Pierre Lamy deceased. For further particulars, see the article FRENCH LITERATURE.

ACADEMY OF ARTS AND LETTERS, AMERICAN. This society was founded in 1904 by seven members of the National Institute of Arts and Letters, on the model of the French Academy. Its membership is limited to fifty mem-

bers. In 1909 a series of annual meetings was begun. Mr. William Dean Howells has been president of the Academy since its founding. The annual meeting was held Nov. 19, 1910, in New York. During the year the Academy has lost three of its members: Theodore Roosevelt, Kenyon Cox, and Henry Mills Alden. Three new members were elected: Charles A. Platt, of New York; Maurice Francis Egan, of Washington; and Archer M. Huntington, of New York. This still left one vacancy in the society. During the first part of 1919 a series of lectures were held at the Chemists' Club in New York. Four of these were on "The Victory," three on "The Failure of German Kultur," and one on "The Academy and the English Language." On February 19-22 a commemoration of the centenary of the birth of James Russell Lowell was held in New York. Hon. Elihu Root presided at a dinner on February 20th, while other speakers were John Galsworthy, Maurice Hutton, and Prof. Brander Matthews. Literary exercises were held on February 22nd, the speakers being: William Milligan Sloane, Barrett Wendell, Alfred Noyes, Stephen Butler Leacock, Edgar Lee Masters, and Samuel McChord Crothers. A report of this commemoration was published by the Academy, which also published a book entitled *The World War: Utterances Concerning its Issues and Conduct by Members of the American Academy of Arts and Letters*. The Academy has under way a project to undertake "the work of establishing through local endowments a museum of art in every one of the States (more than thirty) which lack such an institution."

In 1919 the membership list was as follows: William Dean Howells, John Singer Sargent, Daniel Chester French, John Burroughs, James Ford Rhodes, Horatio William Parker, William Milligan Sloane, Robert Underwood Johnson, George Washington Cable, Henry van Dyke, William Crary Brownell, Basil Lanneau Guildersleeve, Woodrow Wilson, Arthur Twining Hadley, Henry Cabot Lodge, Edwin Howland Blashfield, Thomas Hastings, Brander Matthews, Thomas Nelson Page, Elihu Vedder, George Edward Woodberry, George Whitefield Chadwick, Abbott Henderson Thayer, George deForest Brush, William Rutherford Mead, Bliss Perry, Abbott Lawrence Lowell, Nicholas Murray Butler, Paul Wayland Bartlett, Owen Wister, Herbert Adams, Augustus Thomas, Timothy Cole, Cass Gilbert, William Roscoe Thayer, Robert Grant, Frederick MacMonnies, Julian Alden Weir, William Gillette, Paul Elmer More, Barrett Wendell, Gari Melchers, Elihu Root, Brand Whitlock, Hamlin Garland, Paul Shorey, Charles Platt, Maurice Francis Egan, Archer Huntington. The permanent Secretary of the Academy is Robert Underwood Johnson.

ACADEMY OF SCIENCES, NATIONAL. A body of distinguished American scientists incorporated by Act of Congress, March 3, 1863, for the purpose of promoting scientific research and of examining, investigating, and reporting upon any subject of science or art when called upon to do so by any department of the government.

The autumn meeting was held Nov. 10th-12th at Yale University, New Haven, Conn. Among the topics discussed were "Four Cliff Islands in the Coral Seas," by W. M. Davis; "A Study in Synthetic Paleontology," by Richard S. Lull; "A New Method for Determining the Solar Constant of Radiation," by C. G. Abbot; "Defects

Found in Drafted Men," by C. B. Davenport and A. G. Love; "Some Restorations of Extinct Vertebrates," by John M. Clarke; "On the Mechanism of Fever Reduction by Drugs," by H. G. Barbour; "Experimental Pneumonia in Monkeys," by F. G. Blake; "Calculating Ancestral Influence in Man," by H. H. Laughlin; "Plato's Atlantis in Paleogeography," by W. D. Matthew; "Changes of Land and Ocean Levels," by R. A. Daly; "Concentration of the Water Soluble Vitamine or Yeast," by T. B. Osborne; "On the Embryological Basis of Human Mortality," by Raymond Pearl; "Endomixis in Relation to Selection in Paramecia," by L. L. Woodruff; "The Activities of the Ions of Largely Ionized Substances," by A. A. Noyes and Duncan MacLunes; "The Relative Physiological Efficiency of Spectral Lights of Equal Radiant Energy Content," by Henry Laurens and H. D. Hooker; "The Adjustment to the Barometer of the Haemato-Respiratory Functions in Man," by Yandell Herderson; "A Kinematic Interpretation of Electromagnetism," by Leigh Page; "A Statistical Method for Studying the Radiations from Radioactive Substances and the X-rays," by A. F. Kovarik; "Lethargic Euccephalitis and Polio-myelitis," by Simon Flexner.

In 1919 there were 173 active members, one honorary member, and 32 foreign associates. There are 15 trust funds totalling \$276,651.52. Officers for 1920 are: President, Charles D. Walcott; Vice-President, A. A. Michelson; Foreign Secretary, George E. Hale; Home Secretary, C. G. Abbot; Treasurer, F. L. Ransome.

ACCIDENTS. See RAILWAY ACCIDENTS.

ACES OF AMERICAN ARMY. See AERO-NAUTICS.

ACLAND, Sir THOMAS DYKE. British member of Parliament, died at Exeter, England, February 18th. He was born in 1842, educated at Exeter and at Oxford, and called to the bar in 1868. He went into politics on the Liberal side and became a member of Parliament in 1882, continuing to sit till 1892. In 1886 he was secretary to the Board of Trade.

ACTIONATED SLUDGE. See SEWERAGE.

ACTORS' STRIKE. See STRIKES AND LOCK-OUTS.

ADELPHI COLLEGE. A non-sectarian institution of learning at Brooklyn, N. Y. In the summer school of 1919 the enrollment was 167 and in the fall that in the women's college was 392. There were 26 members in the faculty. The library contains 17,500 volumes. President, Frank D. Blodgett, LL.D. Adelphi was founded in 1896.

ADEN. A British territory, consisting of a volcanic peninsula on the Arabian Coast, about a hundred miles east of Bah el Mandeb, and forming a part of the Presidency of Bombay. Area, 75 square miles; with the Island of Perim 80,000 square miles; population of Aden and Perim (1911), 46,165. The Protectorate of Aden has an area of about 9000 square miles and a population of about 100,000. It is an important coaling station on the route to the East and is strongly fortified. The chief industry is salt production and next to that comes the manufacture of cigarettes. The trade is mainly transit. In 1917-18 imports of private merchandise by sea were valued at £4,064,758; by land £128,814; imports of treasure £333,218. Private exports by sea in that year were £3,429,175; by land £1062; treasure £174,514. The chief imports

were cotton goods, grain, hides, and skins, tobacco, coal and provisions; and the chief exports were coffee, gums, hides, and skins, cotton goods, and other provisions. The shipping in 1917-18 included 568 merchant vessels of 1,174,891 tons entered, and of these 301 were British. There is a wireless station in Aden maintained by the Protectorate.

ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION FOR THE. Founded in 1848, this is an association whose main principle is that in a democracy, where no dependence can be had upon a leisure class, science can only be supported as a result of the organization of scientific men. The association has, since its beginning, done work of the greatest importance in encouraging scientific research and promoting interest in its results. It consists of affiliated national societies which either meet regularly on their own account, or during the annual convention week of the association, which is held at the close of each year. During the last 10 years meetings have been held in Baltimore, Boston, Minneapolis, Washington, Cleveland, Atlanta, Philadelphia, Columbus, New York, and Pittsburgh. There is also a Pacific Coast Division which holds meetings independently in the summer time and a general meeting under its direction was held in 1915.

The annual meeting in 1919 was held in St. Louis on December 29th-31st. Dr. James L. Tryon, of the Massachusetts Institute of Technology spoke on the proposed Lodge reservations to the League of Nations, saying that these reservations did not destroy the covenant, but merely Americanized it. Prof. Wm. H. Hobbs, of the University of Michigan, spoke against the League, quoting from President Wilson, Theodore Roosevelt, Wm. H. Taft, and others. Prof. Charles M. Bakewell, of Yale University, spoke for the League. Frank H. Fayant, of New York City, and editor of the *Railway News Journal*, spoke on "Freight Rates." He denied that increased freight rates had added greatly to the cost of living. He said that "transportation was never before so cheap in relation to prices as it is to-day." Frank W. Noxon, of New York, spoke on the Esch and Cummins bills for the return of the railroads to private ownership. Morris Fay, a prominent New York banker, denounced the excess profit tax as "unjust, unsound, and dangerous." He declared that a tax of 1 per cent on sales would bring the government about \$5,000,000,000 annually, without having a demoralizing effect on capital. The official organ of the association is the weekly journal *Science*. The membership is nearly 15,000.

ADVANCEMENT OF SCIENCE, ASSOCIATIONS FOR THE. Important bodies of scientists in the United States and foreign countries organized for the purpose of promoting the unity of scientific endeavor among the nations. They have been established in the United States, Great Britain, France, Australia, South Africa, and elsewhere. Owing to the war, statistics of the foreign bodies were not available. For the American society, see ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION FOR THE.

ADVENT CHRISTIANS. See ADVENTISTS.

ADVENTISTS. The largest branch of this denomination is the Seventh-Day Adventists. The report of 1919 shows the following figures: 4181 churches with 162,667 members, showing

an increase of 10,000 over 1918; 1102 ordained ministers; 5610 Sabbath schools with a membership of 171,914, showing an increase of over 30,000 over 1918; 1446 Young Peoples' Societies with a membership of 27,879; 41 publishing houses, printing 142 periodicals in 94 languages; 32 sanitariums with 2065 employees including 144 physicians; total funds contributed amounted to \$6,895,719.82 during the year. There are 158 mission fields. There are 77 educational institutions connected with the church, 16 of which carry full college courses, notably Loma Linda College, Pacific Union College, Union College, and Walla Walla College.

Other branches of Adventists are: Adventist Christian Church, with (1916) 30,316 communicants, 640 churches, and 826 ministers (the figures for 1919 being about the same); Adventist Church of God, with about 10,000 communicants, 100 churches and 80 ministers in 1919; Life and Advent Union, with about 700 communicants, 20 churches, and 15 ministers; and the Churches of God in Christ Jesus with about 4000 communicants, 90 churches and 50 ministers.

AERONAUTICS. The record in aeronautics for 1919 is one somewhat difficult to summarize inasmuch as the termination of the war materially changed the aspect and conditions of use, manufacture, and development. Naturally there was considerable reaction attending the demobilization of the aero squadrons of the hostile armies and the partial cessation of manufacturing of war aircraft. On the other hand the problems of peace became more distinct and conspicuous, and an earnest attempt was made to consider the airplane and the dirigible on a strictly utility basis. Government planes were devoted to mail carrying on regular routes, passenger service was attempted, and the large bombing planes of the war were being considered as available for freight or passenger service. Scientific and technical studies continued rather in the nature of improvement of detail and design than to secure radical departures or innovations. Power, capacity and safety were naturally considered of increasing importance, and work along these lines continued. The manufacturing industry was slow in stabilizing itself after the war, and in the United States the failure of the government to settle on a fixed policy as to its control of aircraft and its development in the future was another contributing cause.

Of course the outstanding events of the year were the notable transatlantic flights by airplanes and dirigibles and these are outlined in the following paragraphs.

TRANSATLANTIC FLIGHTS. The year 1919 was memorable in the history of aviation for the first flights across the Atlantic Ocean by both aeroplane and dirigible. It will be recalled that the year 1909 marked Louis Blériot's successful attempt to cross the British Channel, and in the course of 10 years the science and art of aviation had developed to a point where a sustained flight in the air had become commonplace. The first successful flight across the Atlantic was achieved by aviators of the United States navy using NC flying boats, jointly developed by the United States navy and the Curtiss Engineering Corporation, the N in the designation standing for navy and the C for Curtiss. These flying boats were able to plow through rough water up to a speed of 60 miles per hour, and

then take to the air and fly at a speed of over 90 miles per hour. The hull or boat proper was 44 feet 9 inches in length by 10 ft. beam, with six water-tight compartments in which were the rest quarters, navigating compartment, gasoline tanks and space for the radio apparatus and its operator. A minimum crew consisted of five men, though under certain circumstances extra men could be carried for relief. The wings had a total area of 2380 square feet, while the tail had over 500 square feet area. It was different in design and construction from other flying machines, being made up in the general form of a biplane. There were four Liberty engines mounted between the wings, each having a capacity of 400 brake horse power, so that when the full load of 28,500 pounds was carried, the weight is 17.5 pounds per horse power. There is a tractor propeller on each side of the centre line driven by an engine, and on the centre line itself the two remaining engines are mounted in tandem, the front one driving a tractor propeller and the rear engine a pusher propeller. The principal dimensions and characteristics of the NC type of flying boat are as follows:

Engines	4 Liberty
Power	1,600 h.p.
Wing span	126 feet upper 94 feet lower
Length	68 feet 5½ inches
Height	24 feet 5½ inches
Weight, empty	15,100 lbs.
Weight, loaded	28,500 lbs.
Useful load	13,400 lbs.
Gravity tank	90 gals. capacity
Fuel tanks	1,800 gals. capacity
Oil tanks	160 gals. capacity

The NC type was developed following a conference between engineers of the U. S. navy and the Curtiss Company held in November, 1917, at Washington, D. C., and in January of the following year a working model was tested in a wind tunnel, and the design was found practical. Machines were straightway put under construction, and in October, 1918, the NC-1 was given a trial flight at Rockaway Beach, Long Island. In the following months this flying boat made a trip from Rockaway to Anacostia, D. C., 358 miles, in 5 hours and 19 minutes. In the meantime other planes of this type were completed, and in February, 1919, the NC-2 was given an altitude trial and climbed 2000 feet in 5 minutes. So satisfactory were the trials of these planes that on February 24th Secretary Daniels ordered four planes to be prepared for the transatlantic flight, and work was begun at Rockaway. On April 3rd the design of the hull of the NC-2 was found impractical and it was taken out of the flight, but the NC-3 and the NC-4 were assembled at Rockaway. The latter was damaged by fire while in the hangar, but the wings were replaced, the elevators repaired, and everything was put in readiness, so that on May 8th at 10 A.M. the three planes, NC-1, NC-3 and NC-4 were able to leave Rockaway for Trepassey Bay, Newfoundland. On account of trouble with the oil feed the NC-4 was forced to make a landing about 100 miles off Chatham, Massachusetts, after a trip of 300 knots. The defect was remedied and a new engine was substituted a few days later, so that on May 14th the NC-4 was able to proceed from Chatham to Halifax in 4 hours and 10 minutes, a distance of 320 knots. The NC-1 and the NC-3 completed their trip from Rockaway to Halifax on the day they started, a dis-

NC-4 AT ANCHOR IN HORTA, AZORES

tance of 529 miles, and on May 10th they proceeded from Halifax to Trepassey, making 529 miles in 6 hours and 56 minutes for NC-1 and 5 hours and 32 minutes for NC-3. Here the squadron of three planes was again united, and on May 16th they left Trepassey Bay for the Azores, a distance of 1250 miles, starting at 10.03 in the afternoon, Greenwich Civil Time. The NC-4, which was commanded by Com. A. C. Read, U. S. A., reached Horta, Azores, in 15 hours and 13 minutes, with an average speed of 78.4 knots per hour. The other flying boats were not as successful. The NC-1, commanded by Lieut.-Com. P. N. L. Bellinger, encountered dense fog and a rough sea, so that the crew was forced to take refuge on a passing steamship, the *Ionia*, which landed them at Horta. The seaplane was so damaged it sank. The NC-3 also encountered fog and heavy clouds, but was able to reach Ponta Delgada under its own power, having drifted and "taxied" 209 miles, and being so much damaged as to be out of the race. On May 20th the NC-4, now the only survivor in good flying condition, made the trip from Horta to Ponta Delgada, 160 miles, in 1 hour and 44 minutes, and then on May 27th flew from Ponta Delgada to Lisbon, Portugal, 810 miles, in 9 hours and 43 minutes, thus completing the transatlantic flight. The flying time from Newfoundland to Portugal, a distance of 2472 miles, was 26 hours, 51 minutes. The reception of the NC-4 at Portugal was most enthusiastic and cordial, and the greatest interest was manifested in both continents over the flight, and congratulations were bestowed at its successful termination. The most careful preparations had been made by the Navy Department, and a patrol of destroyers was organized to maintain stations along the course to communicate by wireless with the flying boats. They were supplied with pyrotechnic and other signals to afford visible marks, and it was believed that the trip could be carried out with a minimum of danger and risk.

The NC-4 left Lisbon on May 30th, and after a halt at Mondego, 100 miles north, owing to engine trouble, proceeded to Ferrol, Spain, 300 miles. On May 31st the NC-4 proceeded from Ferrol to Plymouth, and thus completed the transatlantic flight as scheduled. The total flying time from Rockaway, New York, to Lisbon, Portugal, was 41 hours and 58 minutes, which is comparable with the fastest steamship passage made by the Cunard liner *Mauretania* of 4 days, 14 hours and 27 minutes from Liverpool to New York.

FLIGHT OF THE VICKERS "VIMY" BOMBER. The first non-stop flight from America to Europe was accomplished by the Vickers "Vimy" Bomber, a bi-motored Rolls-Royce aeroplane with two 4-bladed propellers, which was piloted by Captain John Alcock and navigated by Lieut. Arthur W. Brown. The trip started at St. Johns, Newfoundland, at 12.13 p.m., New York time, on Saturday, June 14, and 16 hours and 12 minutes later a landing was made at Clifton, Galway, Ireland, at 4.40 a.m., New York time. The 1960 miles of the Atlantic Ocean were thus navigated at an average rate of 120 miles per hour. The trip was accomplished through fog and mist, but the engines functioned consistently, and the most important mishap was the failure of the radio instruments so that no connection was had with the outside world during the 16

hours of the trip. Captain Alcock and Lieutenant Brown were awarded the *Daily Mail* \$50,000 prize for making the first non-stop flight between Europe and America, and their conclusion, as expressed by Captain Alcock, was "that the Atlantic flight is practicable, but I think it should be done not with an aeroplane or seaplane but with flying boats. We had plenty of reserve fuel left, using only two-thirds of our supply." Captain Alcock had been for many years interested in aviation and aeronautics, starting his experiments with gliders, and in 1911 began to fly. In 1913 he won the first race in which he ever entered, and shortly thereafter took second place in the London to Manchester and return competition. He was the first man to bomb Constantinople, and it was on his return from his second bombing expedition over the Turkish capital that his engine failed, and forced to descend he was captured by the Turks.

The Vickers "Vimy" plane was twin engined and had a 67 feet 2 inch wing spread, being 42 feet 8 inches in length with a gap of 10 feet and a chord of 10 feet 6 inches. It was of the bombing plane type and was transformed for peace work by replacing the fighting equipment with gasoline tanks with a total capacity of 870 gallons. The two Rolls-Royce Eagle 375 horse power engines were mounted between the upper and lower planes on either side of the fuselage. Hollow seamless steel tubing extending from the nose to well behind the planes was used in the construction, and a tank system of eight separate containers from which fuel could be consumed simultaneously at the same rate were important characteristics. A gravity tank at the top of the fuselage was arranged to be emptied first so that it could serve as a life raft any time after the first two hours of the flight. This 1960 mile flight established a new world record, breaking that of Captain Boehm in a Mercedes driven Albatross plane which flew for 25 hours and 1 minute and covered 1350 miles.

ENGLAND TO AUSTRALIA FLIGHT. The prize of £10,000 offered by the Australian government for the first airplane flight from Great Britain to Australia within a maximum time of 30 days was won by Captain Ross Smith flying a Vickers-Vimy Rolls-Royce airplane. This journey of about 11,500 miles was accomplished in 27 days, 20 hours and 20 minutes, the departure being made on November 12th from Hounslow aerodrome and the landing on the northern coast of Australia taking place on December 10th at Port Darwin. The machine traveled by way of Lyons, Rome, Cairo, Delhi, Calcutta and Rangoon, and arrived at Bangkok on December 1st. Leaving on the following day it reached Singapore on the 4th, and then on the 6th proceeded down the coast of Sumatra over the island of Java to Timor from which place the last stage was accomplished. Arrival at Port Darwin did not end the flight which, after a few days' rest, was continued across the island towards Melbourne. In competing for this same prize Captain Howell and a companion who left Hounslow on December 4th met with disaster off Corfu on December 10th and lost their lives.

TRANSATLANTIC FLIGHTS OF THE R-34. The British dirigible R-34 left East Fortune, near Edinburgh, Scotland, at 2 a.m., July 2, and proceeded via Newfoundland to Mineola, New York, arriving at Roosevelt Field at 9 a.m., Sunday, July 6. To show that this was not merely

good fortune, a return trip even more successful was made, leaving New York at 11.58 on the night of July 9th. After a brief trip over the city of New York the nose of the dirigible was turned to Great Britain and after a voyage of 75 hours, 3 minutes, a successful landing was made at Polham, England, arriving at 9.15 A.M. on July 12th, a distance of 3200 miles. In other words, the R-34 flew practically 7000 miles in 183 hours and 15 minutes. The journey from Scotland to America was accomplished in spite of fog and heavy squalls and thunder storms and against constant head winds. The speed was thus reduced, so that it was uncertain whether the 5000 gallons supply of gasoline would be sufficient to keep the engines turning until Long Island was reached. Accordingly wireless messages were sent for United States destroyers to stand by on the journey down from the Bay of Fundy, but assistance was not required, and a successful landing was made at the Mineola flying field. The return voyage was without incident, and general satisfaction was expressed at the outcome of the trip.

The British naval dirigible R-34 in 1919 was the largest dirigible afloat, measuring 643 feet from nose to stern, and requiring a hangar 300 yards long. The envelope was built of sheet duraluminum towers 91½ feet in height, and the beam is 71 feet. From the envelope are suspended 4 cars, one forward for the captain and pilot, 2 wing cars amidship, and an after car in which are the two engines attached to the same shaft that drive the largest of the four propellers. The propellers of the forward and wing cars measure 17 feet 6 inches from tip to tip, while that on the after car measures 19 feet 6 inches, and was one of the largest ever made. Five Sunbeam Maori engines of 275 horse power each were used to drive these propellers. The R-34 attains a speed of from 40 to 60 knots an hour, and is capable of reaching an altitude of 15,000 feet, though her best height is 4000 feet. When fully inflated the airship has a capacity of 2,000,000 cubic feet of hydrogen, carries 13 tons of water for ballast, arranged in bags along the keel to keep the airship upright. The lifting power is furnished by 19 separate gas bags inside the rigid envelope. These bags are so partitioned that there is plenty of opportunity for the crew to pass freely throughout the interior of the envelope. There are 81 tanks, which were filled with 5670 gallons of gasoline when the R-34 left England. The airship is lighted throughout by electricity, with telephone and bell connection between the cars, and is rigged with various types of equipment, just as an ocean liner. The wireless of the airship is controlled from the captain's car forward and has a range of 800 miles for sending and receiving. The R-34 has a large beam capacity and carries a crew of 31 men. The officers on the trip to America were Maj. G. H. Scott, commanding officer and pilot; Maj. G. H. Cooke, B.S.O., navigator; Capt. G. S. Greenland, first officer; Lieut. J. D. Shotter, engineer officer; Lieut. H. F. Luck, third officer; while Brigadier-General Maitland and Major Pritchard represented the British Air Ministry and Lieut.-Com. Z. Lansdowne, O.B.E., the United States Naval Air Service. Lieutenant Guy Harris was meteorological officer and Second Lieut. R. D. Durrant was wireless officer. The crew of the R-34 consisted of 12 engineers and 7 recruits, beside 2 wireless men.

FLIGHT OF HAWKER AND GRIEVE. An attempt was made to cross the Atlantic in a Sopwith bi-plane by Com. Mackenzie Grieve and Maj. Harry Hawker. This plane followed the general type of the Sopwith war plane, and was 46 feet wide and 31 feet long, weighing 6000 pounds fully equipped for flight. It was supposed to have a flight duration of 25 hours at 100 miles an hour, and was driven by a Rolls-Royce engine developing 375 horse power and 1800 revolutions of the crank shaft. A 4-bladed propeller was used, geared down to 1281 revolutions. Several test flights were made in March and April which promised success, and on May 18th Hawker and Grieve flew from St. Johns, and after 15 hours in the air were forced to alight on the ocean 1000 miles east of their starting point and 900 miles from their destination. The difficulty was due to the choking of the filter and defects in the circulation system of the engine, and realizing that the motor was functioning improperly, the course was changed so as to cross the main shipping route. Sighting a steamer, which proved to be the Danish ship *Mary*, signals were made and the aviators were taken off in a rough sea, but it was impossible to save the aeroplane. Hawker and Grieve were about 14½ hours from Newfoundland and accomplished about 1000 miles of the journey. The British destroyer *Wolston* made the *Mary* off Loch Eireball and the aviators were duly brought to land.

LOSS OF THE C-5. The American Navy dirigible or Blimp C-5 left Montauk Point on May 14th in an attempt to cross the Atlantic by way of Halifax, at which port it arrived at 10 o'clock on the morning of May 16th, after being in the air almost 26 hours. A perfect landing was made at the Pleasantville base near St. Johns, and the dirigible was duly anchored within an old cricket field. Preparations were straightway begun for the transatlantic flight, but a treacherous gale arose which drove the dirigible from its moorings and carried it out to sea, where it was totally destroyed. The dirigible was under command of Lieutenant-Commander Coil, with Lieutenant Campbell and Lieut. J. B. Lawrence as navigating officers. The total distance of 1050 miles accomplished by the C-5 was a world's record for non-rigid airships as regards total distance covered without a stop. The C-5 was 192 feet long, 43 feet wide and 45 feet high, with a capacity of 180,000 cubic feet of gas. Its cruising speed was 42 miles per hour, and it could climb 1000 feet per minute. The car suspended from the gas bag was of streamline form 40 feet long, 5 feet in maximum diameter, with steel tube outriggers carrying an engine at either end. It had a capacity of 7 passengers, though 4 formed the usual crew. The engines were made by the Union Gas Engine Company, and were 125 horse power each.

TARRANT TRIPLANE. One of the most powerful aeroplanes to be built in 1919 in England was the Tarrant triplane, a huge 6-engined 3000 horse power machine, fitted with six "Napier" Lion engines capable each of developing 507 horse power, and designed to obtain with full load a speed of over 90 miles per hour with two engines cut out. Fully loaded this machine weighed approximately 45,000 pounds, of which 19,000 pounds represented the load, 10,000 pounds fuel, and 9000 pounds available for passenger or cargo. Its maximum speed was over 110 miles an hour, and sufficient fuel was carried to maintain this

THE VICKERS-VIMY BIPLANE

First Aeroplane to Cross the Atlantic in a Single Flight. Captain John Alcock, Pilot. Lieutenant Arthur W. Brown, Navigator

for over 900 miles, while at cruising speed a distance of 1200 miles could be covered. This was a triplane with the middle plane having a span of 131 feet 3 inches, with a total surface of wings of 4950 feet and an over all height of 37 feet 3 inches and over all length of 73 feet 2 inches. It was designed for a crew of five men provided with wireless equipment, guns and ammunition and bombs and gear, and was considered a machine of unusual power, some 13 months being required for its construction.

On May 26th, during a trial flight, this large machine was seriously damaged, and the chief and assistant pilots, Capt. F. G. Dunn and Capt. P. T. Rawlings, received injuries resulting in their death. At this initial trip it was found impossible to rise from the ground using the four engines, so the two upper engines were brought into operation. When this was done and before the plane could leave the ground, the tail rose up and the nose of the machine crashed downward into the earth while at a speed of over 70 miles an hour. It is believed that if the aeroplane could have risen, all six engines might have functioned; but the results of the initial trial seemed to show that the problems connected with their placing and operation had not been adequately worked out.

LAWSON AIR LINER. This airplane designed, manufactured and operated distinctly as a passenger carrying machine on a commercial basis made a number of interesting trips in the autumn of 1919, proceeding from Milwaukee, Wis., to New York and thence to Washington. It had a capacity of 26 passengers with a comfortable enclosed cabin, and was specially designed for high speed and economy of fuel. It was stated that the machine had reached a point where the trip from New York to San Francisco could be made in 36 hours actual time between cities.

HELICOPTERS. During the year there was announced a prize of \$100,000 to be awarded to the person who should produce and demonstrate the first heavier than air aircraft which would rise from and land on the ground vertically, as for example, rise from and return to the roof of a medium size house. This prize was donated by a French patron and enthusiast of aviation, M. Michelin, who previously had given many valuable prizes for aircraft development and performance, all of which had been won though when first announced the conditions were considered difficult if not impossible of realization. The new prize was offered to the designer or aviator of the first aircraft: (1) to rise vertically from the ground; (2) to possess the greatest possible range of speed up to 124 miles an hour; (3) to land vertically within a radius of five meters.

This of course plainly indicated some form of helicopter or screw machine where the propeller blades or vanes revolved about a vertical axis. Considerable experiment work had been done in this field but the practical achievement was limited in comparison with the vast studies made in other departments of aviation, notably the airplane. However the problem always had a fascination for scientific men and in 1919 there were announced some encouraging results of experiments undertaken by Peter Cooper Hewitt and F. B. Crocker. In 1918 these two experimenters met at Ampere, N. J., and inaugurated a series of tests on a helicopter which presented considerable promise. The machine de-

veloped a lift of 4000 pounds with two motors of 100 horse power each and propellers 51 feet in diameter. The experiments, as announced up to the end of 1919, did not actually involve flight, but the production of lifting power which was accurately measured by dynamometers and weighing mechanisms. Electric motors rather than internal combustion engines were employed in the experimental work so as to secure any desired speed of rotation and measure readily the consumption of power. The two propellers were mounted one above the other on concentric shafts and being respectively right and left screws were revolved in opposite directions. They were placed vertically seven feet apart. The propeller blades were made of an aeroform model, 30 inches wide and about 15 feet long, being built up of aluminum partitions placed transversely and then sheathed. These propeller blades revolve at low angular velocity compared with those of an airplane and the speed of airplane engines would be considerably reduced. Various types of propellers were tested in these experiments and a form finally was produced that gave a lift of 2550 pounds for 126.5 horse power when making but 70 revolutions per minute or 20.2 pounds per horse power. These experiments so far as announced had not proceeded beyond the full size laboratory stage at the end of 1919, but they indicated considerable promise of success as well as progress in this interesting field.

BRITISH CIVIL AVIATION. On May 1, 1919, the resumption of civil flying was officially permitted in Great Britain and a report on the work of the Department of Civil Aviation of the Air Ministry was issued in the late autumn, covering the period from May 1st to October 31st. It stated that the Cairo-Karachi route had been opened for military purposes and would soon be available for civil traffic. A chain of landing places had also been established on the route from Cairo to the Cape, so that it would be possible to fly over the whole of this route, on an experimental basis, in the very near future. The air navigation regulations might need some slight modifications as a result of experience gained with their application, but no serious difficulties had occurred.

In the period under review, 21,000 flights had been made and 52,000 passengers carried. The total number of flying hours amounted to 4000, and the total mileage covered 303,000. No passenger had been killed in civil flying, although 10 were injured, as also were 6 pilots; and 2 pilots were unfortunately killed. The total number of accidents which occurred was 13, or 1 in 1615 flights, a figure which would probably be considerably improved on in the course of time. Only 1 passenger in each 5200 carried was injured, or 1 in each 30,300 miles flown, but in this connection it should be noted that accidents are most likely to occur when starting up or landing, and as the average flight was of short duration (just over 14 miles) the risk of accident was greater per mile flown than would have been the case with ordinary commercial journeys. Experts from the Department were sent to investigate and report on all accidents, and this it was thought doubtless would tend to reduce their number.

MAIL CARRYING BY AÉROPLANE. The termination of the war making available a large number of aeroplanes and trained aviators, it was natural that schemes to utilize both men

and machines should be developed. These plans were both governmental and commercial, the former including the rapid exchange of official communications, mail and even personal representatives at various conferences and parliaments, and the latter passengers on urgent business and newspapers, special communications of immediate importance and light packages. The reliability of the service seemed to be established, and the experience of military aviators and designers naturally was invaluable. The commercial side, however, involved the question of the increased cost of transportation of passengers and freight, and here it was not possible to say by the end of 1919 how much progress had been made. Whether the saving in time could be measured by an appropriate cash value was not always clear, and it was realized that developments in commercial aeronautics must adjust themselves to new ideas of value. As regards mail service, however, it seemed to be unmistakable that such work could be efficiently and regularly carried on, but it must be remembered that in 1919 much was done with machines already constructed for the military service. The transition from the extraordinary and unusual of the war, where expense of construction and operation was a minor consideration, to commercial practice, was still a problem in 1919, though it must be said that further progress towards its solution had been made than in any previous year since aviation had been put on a practical basis.

On May 15, 1919, was celebrated the anniversary of the inauguration of the commercial mail service between Washington and New York. On this occasion the same two aeroplanes were used as started the year previously, and they were propelled by the same motors. One of them during the year had been in the air 164 hours, flying 10,716 miles, and had carried 572,826 letters. It had cost in service per hour \$65.80. Cost of repairs was \$4.80. The other plane was in the air 222 hours, flying 15,018 miles, and had carried 485,120 letters. It cost in service per hour \$48.34, and in total repairs \$1,874.76. The entire service between New York and Washington showed 92.73 per cent of performance during the entire year, representing 128,255 miles of actual travel and 7,720,840 letters weighing 193,021 pounds were carried, the revenues from aeroplane mail stamps amounting to \$159,700, the cost of the service \$137,900.06. On Aug. 10, 1918, the flying operations which had been conducted by the army were taken over by the Post Office Department with a single organization, which maintained from the beginning the record made under the military service. Out of 1261 possible trips, 1206 were undertaken, and but 55 were defaulted on account of weather conditions. During rain, fog, snow, gales and electrical storms 435 trips were made. Out of a possible 138,092 miles 128,037 miles were flown. Only 51 forced landings were made on account of weather and 37 on account of motor troubles. It was brought out in the course of the year's work that for postal and daily cross country service aeroplanes designed wholly for war purposes were not suitable, and the De Havilland-4 machines transferred to the Post Office Department after the signing of the armistice were reconstructed to fit them for commercial requirements. The Department also called for bids for specially constructed mail carrying planes.

It was found that the element of danger involved in the military and exhibition flying was almost entirely absent from commercial flying. No aeroplane carrying the mail had fallen out of the sky during the year, and there had not been a single death of an aviator carrying the mail. The only deaths by accident were those of an aviator who made a flight to demonstrate his qualifications as an aviator and that of a mechanic who fell against the whirling propeller of a machine on the ground. But two postal aviators were injured seriously enough to be sent to the hospital. The experience of a year in the mail service with all types and temperaments of aviators established the fact that 200 feet visibility from the ground was the limit of practical flying, although a number of runs were made with the mail between New York and Washington, during which a part of the trip was flown at as low an altitude as 50 feet. The performance of the various planes used in this service was of interest, demonstrating that under proper conditions adequate life could be secured for a plane.

On July 1, 1919, the New York and Cleveland mail route was established, a distance of 410 miles by air and requiring for the flight from $4\frac{1}{2}$ to 5 hours as against 620.64 miles by train and a train time of 13.05 to 17.20 hours. The Cleveland-Chicago route was established May 15, 1919, a distance of 325 miles by air, requiring a flight of $3\frac{1}{2}$ to 4 hours as against 340.28 miles by rail and 6.35 to 10.30 hours train time. The routing followed in 1919 was for the mail plane to leave New York daily including Sunday between 5 and 6 A.M. with between 12,000 and 14,000 letters, and arrive at Cleveland about 10 A.M. and at Chicago about 1 P.M. the same day. By this service any letters mailed too late to leave New York on the 5.30 P.M. train, are advanced so as to make all noon carrier deliveries in Cleveland and all afternoon carrier deliveries in Chicago as well as advancing connections to the middle West 16 hours and to Seattle, San Francisco, and Los Angeles 24 hours.

The mail plane at Cleveland, in addition to mail originating in Cleveland, takes about 14,000 letters daily from train No. 19, which leaves New York at 5.30 o'clock the afternoon before and is not due to arrive in Chicago until 4 P.M., too late for the regular carrier deliveries in that city, and puts this mail in Chicago daily at 1 o'clock, usually a little before 1 P.M. It also makes train connections which would not have been made had the mail remained on the train.

The eastbound mail plane leaves Chicago daily at 2.30 P.M., which is a considerable time after the departure of the Twentieth Century Limited, and overtakes it at Cleveland with an hour to spare and deposits on that train Chicago city mail and mails from westbound connections. This mail then is delivered by the Twentieth Century Limited in New York City at 9.45 A.M. In this way the New York mail is practically advanced 24 hours.

The eastbound mail plane at Cleveland takes besides letters originating in Cleveland and destined for the east between 12,000 and 14,000 letters from train No. 90-28-32, which left Chicago at 11.31 P.M. the previous night, and delivers it at New York City, usually around 1.30 o'clock that afternoon. Had this mail remained on that train it would not have arrived in New York City until 4.44 o'clock the following morning.

Corresponding advantages are secured by the air mail between New York and Washington. In 1919 the southbound mail plane left New York at 8.40 A.M. with New England midnight mail and New York City mail reaching the post office too late for the 1 A.M. dispatch for Washington, also New York up-State mail arriving on New York Central train No. 32, to the amount of 14,000 letters daily, which are turned over to the Washington postmaster in time for the noon and first afternoon deliveries.

The northbound mail plane was scheduled to leave Washington at 10.40 A.M. with some 14,000 letters daily to New York City, including Washington City letters mailed before 9.30 A.M., and New York City mail worked to carriers arriving in Washington on the Seaboard Air Line and Atlantic Coast Line trains from all the southeastern States from Virginia to Florida. This mail reached New York by plane daily about 1.30 P.M. Had it continued by train to New York it would not have arrived in New York City in time to catch any carrier deliveries.

In connection with the New York and Washington aerial mail route a notable flight was made on December 2nd when a specially built De Havilland 4 airplane belonging to the Post Office Department made the trip between the air mail field at Washington and Belmont Park, New York, 218 miles, in 1 hour and 34 minutes with a load of 630 pounds representing nearly 20,000 letters. The rate of speed was 138 miles an hour, the best record ever made in the American mail service.

On July 18, 1919, Postmaster Burleson reduced the postage rate on aeroplane mail matter to two cents an ounce, or the regular rate for first class mail, thus placing the aeroplane mail service on the same footing with all other means of mail transportation.

On August 14th an innovation in aerial mail service was accomplished when an aeromarine flying boat deposited mail aboard the White Star liner *Adriatic* two hours after it had left the dock at Hoboken, N. J. The scheme was announced to have further possibilities in the delivery of ships' manifests after the ships had left port, as cargo could be taken on to the last moment before sailing and the completed manifests delivered long after they had sailed. A special contrivance consisting of a waterproof bag for the mail and a flexible cable attached to the flying boat and carrying the mail bag was employed, and the sack was deposited by driving the aeroplane directly across the ship's course, so that the flexible cable would encounter a steel wire stretched between the fore and mainmast. The experiment was in every way satisfactory, and the use of the method was seriously considered.

During the strike of the railway employees in Great Britain, an aeroplane mail service was established from London to Bristol, Birmingham, Newcastle, Manchester and Glasgow, in addition to a continental service between London and Paris and London and Brussels. This service was very successful, and on the fourth day of the strike 54 aeroplanes were carrying mail. A charge of two shillings an ounce on each letter was made for this special service. On one day a Handley-Page aeroplane transported to Brussels for Holland and Norway 1400 pounds of mail matter and brought back 2000 pounds. This aeroplane mail service was so successful that the

British newspapers urged that it be retained. It was discontinued, as the train service improved during the latter part of the strike.

The first regular French aerial postal service was inaugurated on Nov. 10, 1919, when mail was transported to England from Bourget, near Paris, and from Hounslow in England to Bourget. There had been for some time previously a regular commercial service, the trips being made in two hours and fifteen minutes. It was also contemplated to establish a regular mail service to Morocco.

COMMERCIAL AERONAUTICS. During the year 1919 the commercial extension of aerial transportation took forward strides. In England the Super-Marine Aviation Works, Limited, established the first flying boat passenger service on the south coast with a fleet of 10 passenger carrying ships, five of which fly on alternate days, enabling the other five to be thoroughly overhauled, examined and tuned up during the day on which they are out of service. A government inspector critically examines each individual machine and passes upon its fitness for flight before it proceeds. The service as inaugurated during the summer of 1919 starts at Woolston, near Southampton, and includes the following ports: To Cowes, 10½ miles; Ryde, 15; Sea View, 17; Bembridge, 19; Sandown, 23; Shanklin, 25; Ventnor, 28; Freshwater, 43; Yarmouth, 18; Bournemouth, 33; Poole, 40; Swanage, 38; Weymouth, 60; from Poole to Freshwater, 23; from Weymouth to Freshwater, 42; from Freshwater to Ventnor, 15 miles. This service, it was hoped, could be extended to France with ports of call at Le Havre, Cherbourg and St. Malo. During the summer this service was waiting on the necessary permission, which was to be granted under the rules of the Allied Air Convention.

On March 1st a daily aerial service between Folkestone, England, and Cologne, Germany, was instituted with four aeroplanes, which carried between them 25 bags of mail, but this amount was increased, so that for the three months ending May 31st, 2276 outward and 886 inward bags were transported. This service made possible the delivery of correspondence leaving Cologne one morning to all parts of England and Wales by the first delivery on the following morning.

The American Express Company during the year completed arrangements for a daily air passenger and baggage service between London and Paris, so that a person could leave London and fly to Paris and transact business there and return to London in time for dinner. This service was announced to begin in October, and was to provide an aeroplane carrying one or two passengers and costing about \$100 for a flight one way, and a larger machine carrying 15 passengers, for which the fare was to be about \$60 per person. The latter, known as the air bus, was to leave three times a week, while single passenger carrying aeroplanes would fly daily from the aerodrome. This service was to be in connection with a special automobile service to carry passengers from their hotels to the aerodromes on the outskirts of London and Paris. The general scheme provided for a special form of ticket whereby the passengers assumed the risk of the journey, and the luggage was limited to a single piece of baggage about the size of a suitcase. Those traveling in the fast aeroplanes would have to wear a

head mask and goggles, but those in the air bus would not require any special equipment. The time for the flight was to be between three and four hours, in place of the boat and train running time of about nine hours between London and Paris. The ticket for each trip cost about \$20. It was reported that the American Express Company, through its tourist department, was contemplating the establishment of air lines from Liverpool and Southampton to London.

In Germany an aero passenger service was inaugurated between Berlin and Hamburg in March, during which month 108 flights were successfully carried out and loads of no less than 3737 kilograms were carried. The percentage of failures to complete the trip was stated as only 6.1. This and other services were operated by the Deutsche Luft Rederie, a combination of various firms of German aeroplane manufacturers, which was thoroughly organized both as regards plan and operation. The various lines in operation extended from Berlin to such points as Weimar, Frankfurt, Leipzig, Warnemunde, Hanover, Westphalia and Breslau, in addition to the service to Hamburg already referred to. There were also services from Weimar to Hamburg, Hamburg to Warnemunde, Weimar to Leipzig and Hanover to Westphalia. The Berlin-Weimar route was placed in operation about the beginning of February, and in its first month 120 flights were attempted, of which only 18 were unsuccessful, and no accidents whatsoever were recorded. The Berlin to Hamburg trip cost 450 marks, with a return ticket 700 marks, while serial tickets available over any of the routes operated by the syndicate could be had for 3600 marks and were transferable.

A practical application of the aeroplane was made on July 12th by Jasper C. Mayer, of Washington, D. C., who, missing the steamship *Kashimura Maru* at Seattle, embarked on an aeroplane and overtook the vessel on its way down the Sound. The belated traveler was able to catch the vessel, and at an expense of \$75 was saved a delay of several weeks until the next sailing.

During the middle of the summer a passenger airship was announced to sail from Barrow-in-Furness to Rio Janeiro, which would take 20 passengers and a small cargo. The announced route was by way of Lisbon, Sierra Leone and thence to Rio Janeiro, and the time of flight was estimated at about four days each way. This trip was in the nature of a trial, and if successful a regular service was to be maintained by the Vickers Company, which managed the undertaking. The price of the tickets was £1000 apiece. This special airship, or the R-80, was built at the Vickers-Barrows Works Company by the British Admiralty, with the object of securing a rigid British airship of medium dimensions which would compare with the latest German Zeppelin. The R-80 had a capacity of 1,250,000 cubic feet, or somewhat more than half the size of the R-34. She had a cruising speed of 46 miles and a full power speed of 60 miles an hour, and was 535 feet in length. The passenger accommodations on top of the hull include a large saloon arranged like a Pullman car, a roof garden, a shelter deck and cabins of sleeping berths.

Another British regular air service between London and Paris was organized during the

year by Aircraft Transport and Travel, with General Fosting managing director. Parcels express machines were to leave London at 4 A. M., arriving in Paris two or three hours later, and carried a cargo of 900 pounds, consisting of newspapers or rapid express matter. The plan was to provide space for a passenger or two, but the passenger machines proper would leave later in the day and would have enclosed saloons. This company proposed an alternative ground and sea route when fog or storm made flying impossible, and had as its pilots a number of men chosen for the most part from those of the communication squadron between London and the Peace Conference.

LARGE BRITISH AIRSHIPS. During the year the British Admiralty decided to build a fleet of eight airships larger than anything previously attempted in cars of this class. Three of these huge dirigibles were under construction, one at Beardmore's, one at Bedford, and a third, which is the largest, at the Armstrong Whitworth Works at Barlow in the West Riding of Yorkshire. By the summer of 1919 this dirigible was well advanced and the girder work almost finished. She was 694 feet long, 85 feet in diameter, and had a gas capacity of over 3,000,000 cubic feet. There were seven cars or gondolas, three on each side and one in the centre forward devoted to the controls and the navigation officers. The propelling power was to be six Sunbeam Cossack engines, each capable of developing 400 horse power and a speed of about 70 miles per hour. A fuel capacity of 30 tons could be provided, and it was the intention of the Admiralty to place these airships on regular mail service. The R-39 was to be completed in 1919, and the remaining were to be finished and launched in 1920.

UNITED STATES PURCHASES R-38. During the year the United States Navy Department arranged to secure from Great Britain the R-38, the world's greatest airship which resembled the R-34 in many respects but was larger and had greater horse power, speed, and radius of action. The R-38 was designed for a gas capacity of 2,724,000 cubic feet, was 694 feet long, 86 feet in diameter, 93 feet six inches high and a useful load capacity of 45 tons. The airship was expected to develop a maximum speed of 60 knots. Congress had appropriated \$2,500,000 for the purchase of the airship and for the training of the pilot, and the British Air Ministry offered to train the personnel so that the dirigible could be taken over by an American crew and flown directly to the United States. A hangar at Lakewood, N. J., was under construction by the Navy Department for the R-38.

ALTITUDE RECORDS. During the year 1919 a number of important records in aviation were made. On August 2nd Major R. W. Schroeder, a United States army aviator, flew at Dayton, Ohio, at a rate of 137 miles an hour at a height of 18,400 feet. A two-seated Lepere biplane designed by Captain Lepere, of the French army, was used, which was driven by a 12-cylinder Liberty motor, using a supercharger. This last device consists of a gas turbine and centrifugal compressor, which derives its power from the red-hot exhaust gases of the Liberty motor. The compressed air is fed into the carburetor at the same pressure as at sea level, so that there is plenty of oxygen regardless of altitude. The device was designed by Dr. Sanford A. Moss.

Major Schroeder's flight was in company with Lieutenant G. W. Elfev, an expert aeronautic observer.

The altitude record set by Major R. W. Schroeder at McCook Field, Dayton, Ohio, on September 18, 1918, with an altitude of 28,000 feet made in an American built British Bristol fighter equipped with an American built Hispano-Suiza motor, was broken on July 30th, 1919, by Roland Rohlfs. This record was made in a Curtiss 400 horse power triplane at Roosevelt Field, Long Island, on July 30th, when, in the face of a 100-mile an hour gale, an official altitude of 30,700 feet was accomplished. This was said to be the first time an officially observed flight in excess of 30,000 feet had been made, and stands as an American record, but it does not surpass the altitude record of 33,136 feet made on June 14th, 1919, by Adjutant Casale at Villa Coublay, France. Rohlfs' machine was a Curtiss triplane of the type known as the Wasp, which was designed as a two-plane fighting machine for the American forces, and was completed just before the signing of the armistice. Naturally the aviator employed an oxygen mask and encountered a temperature of 25 degrees below zero, which chilled his motor and made navigation at the higher levels exceedingly difficult.

This altitude record was supplanted by Roland Rohlfs on Sept. 18, 1919, at Roosevelt Field, Long Island, when a height of 34,160 feet was attained. This flight was made in a Curtiss Wasp triplane equipped with a Curtiss K-12 400 horse power motor, and was officially observed, confirmed and homologued by the officers of the Aero Club of America and the Internationale Federation Aeronautique. Both aeroplane and motor were designed and built in America, and the entire flight, reaching more than 6½ miles above the level of the sea, was made in one hour and 53 minutes, with 20 minutes of the time at the highest altitude ever reached, in a temperature of 43° below zero. Rohlfs found perfect conditions, and began taking oxygen at 20,000 feet. He required 75 minutes to reach his greatest altitude and 18 minutes to descend. This flight exceeds Rohlfs' official record of 30,700 feet made on July 30th, and the official record made by Adjutant Casale, of the French army, on June 14, 1919, in a Renault plane with 150 horse power at Villa Coublay, of 33,136 feet. This last flight is 5610 feet higher than Mount Everest, in the Himalaya Mountains,—the highest mountain in the world. Rohlfs is the chief test pilot of the Curtiss Company, and during the year conducted a series of flights with the aim of making altitude records. Subsequent to the record referred to above, in an attempt to secure

a rapid rate of flying, Rohlfs rose to a height of 19,500 feet in nine minutes, 42½ seconds, or at a rate of over 2000 feet a minute.

PROPOSED DEPARTMENT OF AERONAUTICS. The subject of the attitude of the national government towards aeronautics, both military and naval and commercial and scientific, gave rise to considerable discussion during the year 1919. Senator New introduced in the Senate on July 31st a bill to create a Department of Aeronautics. This bill defined the powers and duties of the director, and provided for the organization, disposition and administration of a United States air force, creating the United States Air Reserve Force, and providing for the development of civil and commercial aviation. To this Department of Aeronautics would be transferred the various officers and enlisted men of the army, navy, post office and other services now engaged in aeronautics, and it would be responsible for the development and control of aeronautics generally throughout the United States. The bill provides in considerable detail for the organization of the department and its various officers and other personnel.

ARMY RELIABILITY RACE. On the morning of October 8th, there was started a 2700 mile race across the American continent between Mineola, Long Island, New York, and San Francisco, simultaneous starts being made at each place. Any army pilot who secured the written recommendation of the commanding officer of the field to which he was attached was eligible to compete and the aeroplanes employed must have a speed of 100 miles an hour or greater and motors must be of standard specifications. Compulsory stops of not less than 30 minutes nor more than 48 hours were required en route in either direction at the following control stations: Binghamton, Rochester, and Buffalo, N. Y.; Cleveland and Bryan, Ohio; Chicago and Rock Island, Ill.; Des Moines, Iowa; Omaha and North Platte, Neb.; Sidney, Cheyenne, Olcott, Rawlins and Green River, Wyo.; Salt Lake City, Utah; Salduro, Battle Mountain and Reno, Nev.; and Sacramento and San Francisco, Cal. In order to equalize conditions the race was made for the round trip and the accompanying summary indicates the relative performances. The transcontinental race attracted considerable attention and while there were accidents several of which were attended by fatalities, nevertheless the competition was interesting as showing the progress of American military aviators during and after the war.

The War Department announced the winners in the army reliability test race in the following divisions:

WINNERS ON ELAPSED TIME—EAST TO WEST

	Pilot	Passenger	Type of		Time		
			Mach.	Ds.	Hrs.	Min.	Sec.
1	1st Lt. B. W. Maynard.....	Sgt. W. E. Klein.....	DH-4	3	6	47	7
2	2d Lt. Alex. Pearson.....	Sgt. Royal Atkinson.....	DH-4	4	4	28	—
3	Capt. John O. Donaldson.....	None.....	SE-5	4	4	51	3
4	Capt. H. C. Drayton.....	2d Lt. L. J. Sweeley.....	DH-4	4	7	25	29

† Disqualified—away from Control Stop for over 48 hours.

NATIONAL BALLOON RACE. This competition for free balloons was started on October 2nd at St. Louis with entries from 10 American cities. This race which was organized by Major A. B. Lambert, a veteran balloonist, was started by Captain Charles J. Glidden, the president of the American Touring Association.

TRANSCONTINENTAL AÉRIAL DERBY. During the year the plans for a Transcontinental Aerial Derby from New York to San Francisco, with over \$100,000 in prizes and a first prize of \$20,000, were announced by Captain Charles J. Glidden, who offered to contribute a trophy appropriate to the competition. This competition was to be held under the auspices of the Aerial League of America and sanctioned by the Aero Club of America under the rules of the International Aéronautic Federation. It was to be international in character, and designed to afford a supreme test of the aéroplanes and motors entered. It was proposed to have the competition take place in a series of legs of 250 miles each, with a compulsory stop at the end of each leg, and detailed rules for the Glidden Aéroplane Efficiency Trophy were being drawn by a committee of which Major R. G. Landis was chairman.

ACES OF THE AMERICAN ARMY. In October, 1919, there was published the official list of American aviators who had destroyed enemy airplanes and balloons under conditions enabling official recognition and sanction of the accomplishment to be made, so that the list is most conservative and does not include many machines brought down but not officially certified. On this roll were 66 names, including those who served with the British and French.

In all 428 German planes and 55 observation balloons were brought down by American aviators. The official list follows:

<i>Ace and Squadron</i>	<i>Planes</i>	<i>Balloons</i>	<i>Total</i>
Capt. Rickenbacker, E. V., 94th...	22	8	25
Second Lt. Luke, Frank, 27th....	4	14	18

CASUALTIES OF AMERICAN AVIATORS. The official list of losses suffered by the American army in its aviators showed that there were 32 fliers killed and 39 injured in accidents behind the lines. In action with the enemy 187 fliers were killed, 133 wounded, 47 marked missing and 145 taken prisoner by the Germans. This list is as follows:

	<i>Killed</i>	<i>Wounded</i>	<i>Missing</i>	<i>Prisoners</i>
With independent air force	3	2	2	7
With French squadrons	11	13	..	1
With R. A. F. squadrons	15	12	7	14
With 17th, B. E. F. squadron	8	6	3	8
With 148th squad. B. E. F.	3	3	1	4
With Italian A. F.	2	1
First Army A. E. F.	145	97	34	106
With Second Army A. E. F. Eighth Squad	4

DEATH OF CAPTAIN ALCOCK. Captain Sir John Alcock, the first aviator to make a non-stop aeroplane flight across the Atlantic, later in the year on December 18th, 1919, met with an accident when his plane crashed near Cotevard, Department of Seine Inferieure, Normandy, while flying low in a heavy fog and unable to sight the earth. Captain Alcock received such injuries that he died on the following day.

AEROPLANE. See AERONAUTICS.

AFGHANISTAN. A monarchy of Central Asia between parallels 29°, and 38° 28' north latitude and 61° and 72° east longitude, with a narrow strip running to 75° east longitude; bounded on the west by Persia, on the east by tribal districts under the government of India; on the north by Russian territory and Bokhara, and on the south by British Baluchistan. Area estimated at about 245,000 square miles; population estimated at about 6,380,000. Capital, Kabul; population about 150,000; other large cities: Kandahar (31,500), and Herat (20,000). The Afghans are the dominant race, their leading tribes being the Durrani and Ghilzai, whose number is variously estimated at from 2,200,000 to 3,200,000. Tribes of less numerical importance are Tajik, Hazara, Aimak, and Uzbek. Persian and Pushtoo are the leading tongues and the religion of people and ruler is Sunnite Mohammedanism, Justice is dispensed on the principles of the Koran. There are many fertile plains and valleys although the

country is for the most part mountainous. The chief occupations are agriculture and grazing, and the chief products are rice, wheat, barley, millet, and other grains together with a rich variety of fruits, the latter supplying the chief food of a large class of people and being exported to a considerable extent. The land is cultivated by four classes: Proprietors who till their own fields; tenants in the ordinary sense renting either for money or for a portion of the produce; a class of tenants corresponding to the French métayers who are known as Bazgars; and finally hired laborers. Sheep-raising is important owing to the abundance of a singular variety of fat tailed sheep, native to the country, which supplies the chief meat diet, and abundant grease. Iron and gold are worked to some extent, and copper is reported abundant in the northern part of the country. Among other industries are the production of silks, felts, carpets, and articles of goats' and camels' hair; and at Kabul there are other manufactures for local consumption and for the army. The chief exports are timber, fruit, vegetables, grains, asafoetida, and other drugs, animal products, spices, and tobacco; and the trade, which is chiefly with India, has increased of late years. The leading imports are cotton goods, indigo and other dye-stuffs, sugar, tea, hardware, leather, and silver treasure. The above applies to commerce with India alone. No later figures were available than those given in the preceding YEAR BOOK relating to the trade with India. According to these in 1916-17 the exports into India were £1,144,000, and the imports from India were £1,150,000. The imports and exports from and to Bokhara were reported respectively at about 4,000,000 rubles. The expansion of trade in late years has been attributed to the removal of some of the heavier duties which formerly restricted it. The executive powers are in the hands of the Ameer, an hereditary prince who receives an annual subsidy from the Government of India of 1,800,000 rupees, under the treaty of 1893. His total revenue is estimated at between 12,000,000 and 13,000,000 rupees. The strength of the Afghan army was placed at about 98,000 men, including 18,000 cavalry and 396 guns. The control of foreign policy rests entirely in the British government of India. Down to the early part of 1919 the ruler was Habibullah Khan, who came to the throne on Oct. 3, 1901, but on Feb. 20, 1919, he was assassinated (see below under *History*), and was succeeded by his third son, Amanullah Khan.

HISTORY

THE NEW RULER. On February 20th, the Ameer, Habibullah Khan, was assassinated while sleeping in camp about 40 miles from Kabul. This was followed by the news that the throne had been assumed by his brother, Nasrullah Khan, despite the fact that the heir to the throne was the Ameer's son. Nasrullah had for a long time past shown ambitious designs and a hostile attitude toward Europeans. After the outbreak of the war he headed a party that tried to force the Ameer to the aid of Turkey. The Ameer remained loyal, however, and down to 1919 the situation of the country was satisfactory from the British point of view, in spite of hostile intrigues. During the pre-

ceding year the country had been in general free from sedition, and it had subscribed a considerable sum to the war loan. Nasrullah proclaimed himself Ameer at Jellalabad, and there was danger that the country would be torn into rival factions. The policy at that time outlined by the British government was that of non-interference although the hostility of the new pretender toward Great Britain was well known. Meanwhile Amanullah Khan, the third son of the late Ameer, having secured the support of a large part of the army, announced his accession. On the other hand Nasrullah was said to have great influence among the armed tribesmen throughout the country and among the Mullahs. It was soon learned, however, that Nasrullah had submitted to the new Ameer. The latter gave assurance that the friendly policy of his predecessor would be continued. The new Ameer, Amanullah Khan, was born June 1, 1892, and during recent years had been left by his father in charge of Kabul, when the court removed to Jellalabad.

AFGHAN HOSTILITIES. Amanullah was supported by the army and controlled the treasury and the arsenal. On succeeding to the throne he declared the complete independence of his country, claiming also that he was called upon to free India from the horrors of revolution and from the tyranny of British rule. A body of Afghan troops crossed the border, May 2, and received some half-hearted support, but the tribesmen for the most part held aloof. The use of aeroplanes and the bombing of their forces at Jellalabad, Dakka, Kabul, and at other important points, soon produced their effect and on May 15th their commander-in-chief asked for a cessation of hostilities. This was refused, as the request had not come from the Ameer. Fighting now took place in the south in the regions of Khost, Kurram, and Zhob, and the British garrison in Thal was threatened. The enemy was soon routed in Thal, however, and one of his strongest posts was captured. On May 28th, the Ameer sent a letter to the Viceroy enclosing a copy of his order to his generals to cease fighting but putting the blame for the hostilities on the British. After some hesitation over the British terms and an evasive reply on July 18th, he wrote on June 29th expressing the hope that the Viceroy would fix the date for the reception of his envoys. He still referred to the one-sided nature of the armistice conditions. Discussions began, July 26, and the British conditions were accepted, August 8. See INDIA, BRITISH (*History*).

AGRICULTURAL COLLEGES. See AGRICULTURAL EDUCATION.

AGRICULTURAL CREDIT: The immediate demand for food products in large quantities in the past few years necessitated the extension of financial credit to the farmers of all countries. The Continent had had a credit system with this purpose in view in operation for a number of years, while in the United States the Federal Land Bank Act approved by Congress in July, 1916, and put into operation in February, 1917, was hardly organized long enough

to consider it fully prepared for this unusual emergency. Capital was needed in large quantities at reasonable rates of interest to enable the farmers to work their land at maximum capacity, and it was to meet such a possible situation that Congress had approved the Federal Land Bank Act. A description and résumé of the act may be found in the 1918 YEAR BOOK. The act has succeeded both in improving the method of making loans and in reducing to approximate equality throughout the United States, the cost of borrowing on farm mortgage security. The aim of the act cannot be fully realized until the methods of scientific farming become known to the average small farmer who will then be able to utilize these loans to greater advantage than he now does. The present tendency among a number of small farmers is to take loans, thus increasing their total indebtedness, without carefully investing the money so as to increase their productive and earning capacity in a like or greater ratio.

FEDERAL RESERVE ACT. Short term agricultural credit has been provided for according to the provisions of the Federal Reserve Act which has made it possible for member banks to discount notes, drafts, and bills of exchange issued or drawn for agricultural purposes or based on live-stock, and having a maturity not exceeding six months. In this way the short term paper of the farmers has found a desirable channel to the commercial banks where it can be readily discounted along with other desirable commercial paper. In giving this short time credit the farmer is called upon to give a financial statement of his business, and in this way indiscriminate loans which would tend to reduce the value of the notes are eliminated. The popularity of this type of agricultural credit is rapidly increasing, having passed the three billion dollar mark in the fall of 1918.

FARMERS' FUND. The Patriotic Farmers' Fund which was organized in New York State two years ago by public-spirited men to make small loans to farmers who are not in a position to obtain ready bank accommodations on their own credit, has been reorganized and incorporated under the State banking laws as the "Farmers' Fund, Inc." The original purpose was to give aid to production during the war, but the results were such as to encourage the managers to believe that a permanent organization in that field was wanted. The success of the plan was largely due to the voluntary coöperation of 1500 local loan committeemen throughout the State, who passed upon the applications, and the agent banks which handled the funds and looked after collections. It is estimated that the food production of the State was increased \$5,000,000 as a result of the loans.

The permanent company is now organized with a capital of \$400,000 and a surplus of \$100,000 under the investment company law of the State. It will be governed by a board of directors composed of 30 well-known bankers. Loans will be made only to directly aid production, not for building purposes or to buy land. Total loans since May 28, 1919, the date of incorporation of the new company, including those taken over from the Patriotic Farmers' Fund were \$663,758.50 of which \$235,050.51 have been repaid, leaving \$428,707.99 outstanding. The loans were divided as to general character as follows: crop loans 50 per cent, live-stock loans 35 per cent,

machinery loans 15 per cent. Loans exceeding \$500 in amount, which were not numerous, were secured by chattel mortgages.

AGRICULTURAL EDUCATION. IN THE COLLEGES. The year 1919 has been a very trying one on the agricultural colleges. The disbanding of the Students' Army Training Corps begun in 1918 was completed early in 1919. This left the colleges with disorganized classes, and a greatly reduced student body. In addition many of the faculty were doing war work in one capacity or another and were now beginning to return. However, the colleges without exception faced this condition with courage and began a reorganization of their forces. It is yet a matter of experiment what will be done with the four-quarter year begun under the Students' Army Training Corps, but safe to say it is likely to be adopted with some modifications.

For various reasons the Students' Army Training Corps plan of training proved a failure from the college standpoint although some lessons could be had from that experience. The usual summer courses were given and at the opening of the new college year in the fall of 1919 the colleges were facing the task of taking care of the large number of students that were flocking to their doors. The colleges were forced to increase their teaching staffs, in some cases as much as 30 per cent, in order that this large student body could be taken care of. Much attention is now being given to the improvement of instruction in the colleges and the courses of study are being carefully scrutinized, criticized, and revised with the view of making the instruction more efficient. Substantial support to the colleges has been granted by the legislatures of the states, this coming in the way of increased appropriation for instruction, increasing the faculty and substantially increasing the salaries of the instructors and adding to the funds for extension teaching and for permanent equipment.

Among the substantial evidences of progress may be noted the provision by the Minnesota legislature for new buildings of \$505,000 for the first year and \$560,000 for the second year of the biennium, the last being the first item of a \$5,600,000 10-year fund, a special appropriation of \$60,000 for an engineering laboratory, at the Oregon Agricultural College and \$15,000 for the completion of the buildings salvaged from the Students' Army Training Corps; \$75,000 for special salary increases and \$30,000 for regular increases in California; \$300,000 for a library building and \$141,000 for equipment and improvement of the plant at the Iowa Agricultural College; a special grant in New Jersey of \$75,000 for a new horticultural building; plans for a new administration building at the University of Tennessee, costing \$400,000 and an agricultural building to cost \$275,000; and legislative provision in Texas for an agricultural building to cost \$250,000 and for a building for the extension service to cost \$100,000.

VOCATIONAL AGRICULTURAL EDUCATION. The 48 states have now accepted the provision of the Smith-Hughes Act and have set up a state organization for the administration of the act. The legislatures have matched the appropriation by the Federal government and in several instances have appropriated money in excess of the Federal funds. The State directors and supervisors now number 182. The total fund

allotted in 1919 to the States for agriculture under the Federal Vocational Act was \$782,575.56 of which approximately 75 per cent was expended. The legislatures of 43 of the 48 States met in regular session in 1919. Of these 31 passed vocational legislation of importance other than such appropriation acts as would provide increased funds. For 1919 there were organized in every State schools of vocational agriculture, the total number being 863, which is 42.3 per cent of the entire number of vocational schools of the United States. These schools report 1327 teachers giving instruction to 19,933 students. Two of the outstanding problems of vocational education at present are the adequate training of teachers and the proper supervision of their work.

TEACHER-TRAINING. In 1919, 60 institutions were giving teacher training for vocational agriculture, employing 224 teachers, enrolling 1334 students. With few exceptions the State plans provide as the qualifications of teachers of vocational agriculture graduation from a four-year college course planned for the training of teachers of vocational agriculture and at least two years of practical farm experience. This has generally been recognized as the standard for the country, but during the past two years many of the States have been compelled through a scarcity of teachers to temporarily disregard this standard. The training of teachers of vocational agriculture is in reality the preparation of persons for two vocations, (1) the vocation of agriculture, and (2) the vocation of teaching. Conditions attendant upon the war seriously interfered with the teacher-training programme. Very few teachers were prepared through the regular courses during the war. Many of the States, however, put into operation short intensive emergency courses. Through these courses men experienced in farming, trained in science, and with experience in teaching were given instruction in technical agriculture. These courses are now being rapidly discontinued. Along with the problem of training teachers in college for teaching of vocational agriculture is also the problem of training teachers while in service. Nearly every State has provided for some form of systematic training of teachers while in service, chiefly by regular visits from an itinerant teacher trainer; by intensive short courses in training at the college; by regular courses in home instruction under the supervision of the teacher-training staff; and through frequent group conferences where the problems of instruction are freely discussed.

The problems of teacher-training departments at the colleges are chiefly the content of the course of study, how this course shall be administered, the relations of the teacher-training department to the State board for vocational education, the relations of the department to the other departments of the college, and the problem of practice or apprentice teaching.

SUPERVISION. In 1919, 30 States employed full-time State supervisors; 18 States employed supervisors for part time. In some States the part-time supervisors were lent by the teacher-training institutions to the State board for vocational education. Because of the demands made by the war there were few students enrolled in the teacher-training institutions. The staff for the training of teachers had already

been engaged. Arrangements were therefore made by which the teacher trainers assisted the State supervisors in giving instruction to those teachers who were already in service. This was fortunate since so many of the teachers were new to the work. Owing to the scarcity of trained teachers those who had been removed by war service had to be replaced by others who were not so well trained. In some of the States the programme of vocational agricultural instruction would have suffered if arrangements had not been made for giving an unusual amount of assistance to the teachers in service. It is now recognized that one of the largest problems involved in supervision is that of giving assistance to the teachers in the solution of specific problems connected with their work. In order to do this the States have found it necessary to provide supervisors who not only possess the qualifications of a teacher of agriculture, but also have had successful experience in teaching agriculture. In several States two or more supervisors have been provided in order that all of the vocational agricultural schools might receive the needed assistance.

THE VOCATIONAL SCHOOLS. Development in the field of vocational agricultural instruction in secondary schools has been in the direction of the establishment of departments of agriculture in high schools, or in the establishment of rural vocational schools. At present schools of the first type predominate. Few of these schools employ more than one teacher of agriculture and the pupils, for the most part, live at home on farms. The supervised practice work is usually in the form of home projects. There is a decided trend now toward giving instruction in agriculture to the pupils while still living on the farm rather than taking the pupils from the farms and transporting them to special schools where large numbers may be gathered together. These departments are in the nature of part time schools, the instruction being designed to supplement the employment of the pupil on the home farm. In order that the schools may really carry out this type of instruction it has been found necessary to limit the attendance upon these classes to pupils who can actually carry out some form of farm work. The work in vocational agriculture is usually accepted as a part of the high school course, thus enabling the pupil completing the vocational agriculture work to secure not only the agricultural certificate, but also the diploma granted by the school.

A few of the States have made provision through short part time and evening courses to reach another group which consists of those who have definitely dropped out of school and would not otherwise be receiving school instruction of any kind. There is an increasing number of States making special effort to reach this group. It is generally recognized that a highly important field is to be reached through these part time and evening courses. It is now generally recognized that it is impossible for these secondary schools of agriculture to cover the whole field of agricultural instruction in even a four-year course. Hence, these schools generally now emphasize the phases of agriculture dominant in the community and give less attention to other phases of agriculture which are not so important in that community.

As a result, there is a tendency to formulate the instruction in a given school on the basis of the agricultural needs of the community.

ELEMENTARY AGRICULTURAL EDUCATION. While the problem of reorganizing the secondary instruction in agriculture has perhaps been the overshadowing one for the year, the problem of elementary agriculture has not been overlooked. In many States special appropriations have been made for the rural schools, and added efforts have been made to train special teachers for the rural schools. As the rural problem centres in the farm home and the farm, the problem of rural education centres in the home agencies, and agricultural instruction must link up closely with the farm life activities of the pupils of the rural schools. Campaigns of reorganization and consolidation are being carried on in many States, and in every State close attention is being given to the problems of the rural elementary school.

FOREIGN: France. An annual appropriation of \$250,000 has been made to stimulate improved methods in agriculture following the war. It is planned to develop methods in instruction following the American plan. A general reorganization of agricultural instruction is expected to follow.

England. The great stimulus given to agriculture during the war has been carried over into the reconstruction period. Improved plans of agricultural development are being made. Large appropriations have been made for agricultural instruction. It is planned to carry out an extension plan of teaching based upon a study of the work carried on in the United States.

AN A. E. F. SCHOOL OF AGRICULTURE. The review of the year's work in agricultural education would not be complete without a brief account of this wonderful school of agriculture planned and inaugurated by the Y. M. C. A., and afterwards taken over by the Army Education Commission. This college of agriculture was organized as a part of the great educational plan for the soldiers of the A. E. F. It was established at Beaune in east central France, and enrolled 6000 students, and 2600 more at a nearby farm school at Allery. Through a system of extension work these courses in agriculture were carried to thousands of soldiers, so that there was probably not a single regiment of the A. E. F. in which some sort of educational work in agriculture was not under way—a school, an institute, a short course, a farmers' club, special lectures, or correspondence courses. This work was under the direction of President K. L. Butterfield of the Massachusetts Agricultural College, and associated with him were a large number of the ablest agricultural educators in the United States gathered from the agricultural colleges throughout the country. From the army something more than 150 men were selected for agricultural work, representing 40 different agricultural colleges of the United States. Forty different studies were offered, grouped in four general departments—animal husbandry, agronomy, horticulture, and forestry, and rural economic and sociology. In addition supporting subjects were offered in the other colleges. Instruction was carried on in much the same manner as in the United States, except where necessity has compelled a shortening of laboratory work. Nu-

merous field trips to French farms and forests were helpful in supplementing classroom work. While this school was an experiment, yet its worth was clearly demonstrated. Out of this plan has come a permanent educational policy for the army, combining military training with training for the vocations and professions of civil life. Agriculturally, the results are large, for the farmer-soldiers are stirred to a full realization of their opportunities and their obligations in the rural field.

AGRICULTURAL EXPERIMENT STATIONS. The experiment stations in the United States, as in other countries, have been quite seriously affected by the war and the increased cost of operation. Except in isolated cases there has been no material increase in funds of the American stations for investigation, and the development of other features of the agricultural colleges and the demand from the industries have taken many of their workers. Attention is being sharply called to the situation, which is regarded as serious and as requiring stimulation and more adequate support if the stations are to continue to maintain their place in the growth of agricultural institutions. The Secretary of Agriculture, in an address, has called forceful attention to the necessity for continued research and experiment to add to the sum of scientific knowledge. The importance of this as a national asset was disclosed by the war, which also brought out the fragmentary character of available information in certain lines. The secretary has declared that the nation must have a well balanced programme of research, and that to this end the most capable staffs possible should be secured and maintained.

There have been an unusual number of changes among the directors and investigators of the stations during the past year, due largely to the competition of institutions and the industries for men, and the inability of the stations to meet offers of larger salary. On the whole, however, the principal lines of work were well sustained.

Early in the year the experiment station in the Virgin Islands, established under Danish control, was formally transferred to the administration of the Department of Agriculture. The legislature of Arkansas made provision for buying land for a new substation in the southern part of the State, and also for purchasing land for a farm for the agricultural college and experiment station. A tract of land near Fresno, Cal., was set aside for a fig experiment station to be devoted primarily to experiments in fig culture. In Florida a new citrus branch station was provided for and a site selected at Lake Alfred. It contains several acres of citrus groves and young plantings. A plant has been installed in connection with the Florida station in cooperation with the U. S. Bureau of Public Roads, to determine the value of sewage on the sandy soil of the station.

A new Coastal Plain Station was authorized by the Georgia legislature, and located at Tifton, where land and funds for its use have been donated by local parties. The Indiana Station received a gift of a 400-acre farm in the northern part of the State, for the study of agricultural problems of that section, and another tract of 67 acres for soil fertility tests. The Minnesota Station entered into a contract with a county

poor farm for the use of a portion of its land as a sandy land experiment field. A forest biological station, to be known as the Roosevelt Wild Life Forest Experiment Station, was authorized by the New York State legislature and has been established with headquarters at the College of Forestry, Syracuse University. It will be devoted to studies relating to fish, birds, game, food and fur bearing animals, and forest wild life. In Washington State \$35,000 was appropriated for buildings, equipment and other expenses of a new irrigation substation at Prosser. An act of the Wyoming legislature placed under the experiment station the series of farms formerly controlled by the State Farm Board. This will make possible the development of substations in typical sections of the State to meet the varied local needs.

In the Philippines provision was made for the establishment of an experiment station in connection with the college of agriculture. A tract of nearly five hundred acres has been acquired, farm buildings erected and two laboratory buildings projected.

The corner stone was laid of a new agricultural building at the University Farm, Tennessee, which will cost approximately \$250,000. The Texas Station completed a spacious fire-proof building for research and administration, and the Utah Agricultural College and Station occupied a new well appointed live stock building, costing approximately \$90,000, which will house the departments of animal husbandry, poultry husbandry, range management, and veterinary science.

Dr. Cyril G. Hopkins, head of the agronomy department of the Illinois University and Experiment Station and well known for his work and writings on soil fertility, died at Gibraltar, October 6. He was returning from a year's work in Greece where he had been advising the Government on means for increasing agricultural production.

In an article entitled "Beginnings in Agricultural Education and Research in California," prepared in connection with the semi-centennial of the State university, Prof. E. J. Wickson reviewed in an interesting way the history and development of the agricultural experiment station, established in 1895 (in *Annual Report of the California Experiment Station for 1918*).

An account of the work of the Rothamsted Experiment Station from 1914-1919 (*Journal of the Board of Agriculture*, August, 1919), shows its activity in this period of emergency. This work divides itself into two main groups, namely, problems connected directly with the war and those connected with the development of agriculture after the war. A new laboratory for the Rothamsted Station was opened in October, which was built at a cost of £28,000 supplied by public subscription, private donations, and the development fund of the Board of Agriculture. The work of the latter board on plant diseases and economic entomology has been concentrated at the Rothamsted Station and placed under the control of the Lawes Trust.

The British Board of Agriculture and Fisheries has purchased a farm for experimental work with potatoes; and government aid has been given an organization which will conduct a test of beet-growing for sugar on a commercial scale. Economic conditions resulting from the war having made it impossible to continue on

its original basis the well known Woburn Experimental Fruit Farm, established under the patronage of the Duke of Bedford in 1894, the farm is to be continued with funds supplied by the Board of Agriculture and the Development Commissioners. A volume reporting the results of 25 years of activity has been issued. (*Science and Fruit Growing*, Duke of Bedford & Spencer Pickering, London, 1919.) A Scottish station for testing and registration of agricultural plants has been opened on a farm of about two hundred acres in the vicinity of Edinburgh.

Under a decree of the French Minister of Agriculture, a Superior Council of Agronomic Stations and Agricultural Laboratories has been established, with representatives from the Academy of Sciences, the Academy of Agriculture, and the Ministry of Agriculture. This council will serve as a governing board for these stations and laboratories, determining their policy, lines of work, requirements for support, etc. Provision has also been made in France for departmental and regional chambers of agriculture to deal with programmes for experiments of various kinds and the dissemination of results by various means.

The Agricultural and Colonization Department of the Zionist Commission in Palestine is planning for the establishment of a central experiment station and five branch stations representing typical regions. The station established several years ago at Heft was destroyed during the war, together with the extensive library which had been assembled there. The Macdonald Institute of Agriculture and Plant Experiment Station has been opened near Johannesburg, South Africa. The government of the East African Protectorate has made provision for a scheme of exploration and development of the resources of the country, involving a series of stations located at intervals of 1000 feet in altitude from sea level to 9000 feet. Meteorological data will be taken, and studies will be made on acclimatization and the suitability of different regions for various crops. Laboratory work will be carried out in the government laboratories in Nairobi.

AGRICULTURAL EXTENSION WORK.

During 1919 the coöperative extension work in agriculture and home economics carried on in all the States by the United States Department of Agriculture and the State Agricultural Colleges under the Smith-Lever Act of May 8, 1914, and other Federal and State legislation, passed through a transitional stage. Up to the close of hostilities in the European War the national, State and county extension forces were busily engaged in aiding the farmers throughout the United States in increasing agricultural production to meet the war needs, and both country and city people in conserving the products and making most economical and effective use of available supplies. Since that time special attention has been given to the problems of agriculture and household economy growing out of the discontinuance of military operations and the adjustments necessary to meet conditions arising in the settlement of world affairs after the war. The peculiar economic conditions which have increased the cost of labor and the commodities purchased by the farmer without at the same time bringing him a satisfactory income from his farm operations, the scarcity

of farm laborers and the rapid rise in the value of agricultural land have so impressed upon the farming people the importance of attention to the economic factors of farming that they have insisted that the extension forces shall give a large share of their time to the problems in this field. The county agents and other extension workers have therefore done much to instruct the farmers in improved methods of grading, packing and marketing their products and in forming coöperative associations for buying or selling goods.

There has also been great interest in demonstrations of farm tractors and other improved machinery to make the farmer's work most efficient and profitable and to substitute mechanical power for the farm laborer.

In coöperation with the Treasury Department, a campaign has been carried on to promote thrift, and partly to encourage the purchase of War Savings Stamps and government securities.

As a result of the infirmities and physical defects discovered in country young men examined for the army and the frightful ravages of the influenza epidemic great interest has been aroused in the problems of the health of rural people. The extension forces have therefore turned their attention more largely to matters relating to the sanitation of the farm and the home, prevention of disease through protection against impure water and food and injurious insects or parasites, the proper care and feeding of children, the benefits of suitable recreation, etc. Such work is largely done in coöperation with public health services, school authorities, the Red Cross and other welfare agencies.

Special efforts were made by the extension forces to perfect and establish on a permanent basis the coöperation agencies among the farming people, in order that the extension work might rest more securely on the initiative and active participation of the people themselves.

The number and strength of the organizations supporting the work of the county agents, which are known as farm bureaus, agricultural or farm councils, were greatly increased. These organizations are made up of from several hundred to 2000 or more farmers in the county or are formed by the federation of community clubs. In some cases there are separate organizations for the women but what is sometimes called the family farm bureau comprising both men and women is growing in favor. There are now more than 1,000,000 of the more progressive and influential farming people in these organizations. They often contribute to the salary and expenses of the county agents and take an increasing part in the determination of the programme of extension work.

The annual dues for membership in the county organization vary from 50 cents to \$10 but in some States there are no dues. In a number of States they are recognized in law as the official bodies in whose interest or through which the public funds contributed by the county for extension work are to be expended. As voluntary organizations they often engage in matters which are outside of the functions of the county agents supported by public funds. Sometimes they engage in coöperative buying or selling but it is more common for them to form separate organizations for these purposes. They are also increasingly interested in public questions relating to agricultural interests and the

promotion of improved conditions of country life. State federations of these county organizations have been formed in over 20 States. In Illinois and Iowa the State federations have liberally paid executive officers and have carried on active campaigns for increasing the membership of the farm bureaus and enlarging the scope of their work. The delegates representing the State federation often meet at the State agricultural colleges and confer with the extension director and other college officers regarding the general interests of the extension work in the State. In November, 1919, a national organization known as the American Farm Bureau Federation was formed at Chicago, with J. R. Howard of Clemons, Iowa, as president. The membership of this organization will consist of State farm bureau federations or similar agricultural associations. Its governing body is a board of directors representing the several State federations who will hold annual and special meetings. An executive committee of 12 members representing different regions of the United States "shall have charge of the administrative affairs of the organization" and shall elect its salaried secretary. The Secretary of Agriculture and the Director of the States Relations Service have the privilege of attending all meetings of the executive committee and participating in its deliberations but without the right to vote. This organization will be supported by annual dues from each state association amounting to 10 per cent of the county farm membership dues or in States not having such dues from \$250 to \$1000. The objects of this organization as stated in its constitution are "to correlate and strengthen the State farm bureaus and similar State organizations" and "to promote, protect and represent the business, economic, social and educational interests of the farmers of the nation and to develop agriculture."

Owing to the withdrawal of war emergency funds the number of persons employed in extension work decreased from 7500 on June 30, 1918, to about 5100 in December, 1919. During the same period the number of counties having the services of agricultural agents decreased from 2435 to about 2000, and the counties having home demonstration agents from 1715 to about 815; out of nearly 200 cities which had such agents during the war only 9 have retained their services. The number of paid leaders of boys' and girls' clubs decreased from over 1000 to about 450.

In 1918 in the 15 Southern States 317,500 adult farmers conducted demonstrations under the supervision of the county agents on about 3,207,800 acres, among the principal crops being corn, 774,750 acres, with an average yield of 35 bushels per acre or double the average of the whole territory; and wheat, 317,950 acres, yielding 19.7 bushels per acre. Pruning and spraying demonstrations were made in about 20,000 orchards and advice given regarding tree management involving about 45,700 orchards.

Among the results of the activities of the county agents relating to live stock were the bringing in of 4395 horses and mules, 12,647 pure bred and 15,000 grade dairy cattle, 17,800 pure bred and 40,000 grade beef cattle, 42,850 breeding hogs, 10,775 pure bred and 69,850 grade sheep and goats. With the cooperation of extension specialists the county agents conducted

feeding demonstrations with 3821 horses and mules, 19,200 dairy cattle, 28,317 beef cattle, 71,901 hogs, and 8026 sheep and goats. Poultry demonstrations were conducted on 4623 farms. They aided the farmers in protecting over 4,775,000 head of live stock against diseases, and in the building of 2219 dipping vats and 3800 silos. Over 63,000 demonstrations on the care of manures were conducted and 224,000 farmers were advised regarding the use of fertilizers. Over 2000 groups of farmers were organized to purchase fertilizers coöperatively and in general the farmers were aided in solving their marketing problems. Campaigns for the promotion of home gardens in rural and urban communities resulted in the planting of over 3,000,000 gardens in the South.

Work among the negro population of the Southern States was continued along the same lines as heretofore, largely with the coöperation of the negro agricultural colleges, and the number of negro agents was somewhat increased. In counties without negro agents the white agents do considerable work with negro farmers. Marked progress has been made in encouraging negro farmers to grow home gardens, and keep cows and pigs to provide home supplies of food.

In the Northern and Western States the county agents made over 500,000 farm visits, coöperated with 8575 community committees, and conducted 77,668 demonstrations incident to crop and live stock production. They assisted 348,000 farmers in obtaining seed, resulting in the planting of 5,392,000 additional acres on which over 70,000,000 bushels of crops were produced. About 550,000 farmers tested their seed corn and nearly 100,000 farmers tested seed oats for smut. More than 225,000 families in town and country were assisted in growing home gardens. Assistance in sanitation and demonstration of disease control continued a prominent phase of the work with live stock, in coöperation as far as possible with veterinarians and State and federal control agencies. Among these demonstrations were the testing of 55,962 animals for tuberculosis and the vaccination of 380,264 animals for blackleg and 523,189 hogs for cholera.

About 18,000 farmers kept records of their business on forms furnished by the farm management demonstrators. The value of the coöperative business of farmers' exchanges and coöperative associations organized with the aid of county agents amounted to nearly \$42,000,000, with a saving of over \$4,500,000. Over 19,000 farmers were assisted in securing credit for the purchase of seeds, machinery, fertilizers and other supplies and 151,532 laborers were placed on farms.

The work of the county women agents, commonly called home demonstration agents, and the supervisory officers and extension specialists in 1918 was greatly increased. In the Southern States 23,000 clubs of women and girls, with an enrollment of over 3,000,000, worked with the agents in rural and urban communities, including clubs for negro women and girls with a membership of 350,000. In connection with this work there were established 855 community canneries, 639 community demonstration kitchens; 131 drying centres; 137 rest rooms in cities and towns for farm women; and 20 free curb markets. The programme included gardening, canning, drying, and brining of fruits and vegetables; butter and cheese making; poultry production and market-

ing; purchase and home manufacture of labor-saving equipment; better utilization and conservation of food and clothing; and cooperative marketing. Considerable attention was also given to matters relating to health, recreation and general improvement of rural conditions.

In the Northern and Western States much the same kinds of work were done by the home demonstration agents. Over 13,000 training classes for local leaders in food production and preservation were organized and through demonstrations and home visits over 2,250,000 persons were reached and over 2,700,000 persons attended exhibits prepared by the agents.

Recently special emphasis has been laid on child feeding and hot school lunches. In several States the agents cooperated with the Dairy Division of the Bureau of Animal Industry in campaigns to stimulate the production and consumption of milk and milk products, with special reference to the use of milk in the diet of children. Rapid progress was made in introducing homemade and commercial labor saving devices and improving kitchen arrangement and equipment in farm homes.

During the influenza epidemic home demonstration agents in both North and South did very important work in organizing soup kitchens, emergency hospitals and volunteer nursing services and acted as hospital cooks and dietitians.

In the boys' and girls' clubs about 2,000,000 members were enrolled of whom about 150,000 were negroes.

As heretofore the country boys and girls were active in food production and conservation and other useful work on the farms and in the homes and thousands of city boys and girls had war gardens and helped in food conservation. In the Northern and Western States 41,823 members of canning clubs canned 1,901,789 quarts of vegetables, fruits, meats and soups; 16,128 members of poultry clubs hatched 331,072 chickens and obtained 133,565 dozen eggs; 12,974 members of pig clubs reported 4,423,081 pounds of pork from 25,602 animals; 11,307 members of potato clubs raised 646,503 bushels of potatoes; 8706 members of bread clubs baked 193,207 loaves; 18,951 members of garment-making clubs reported 198,522 garments made; 115,725 members of home-garden clubs grew and reported on gardens: 251,032 members of clubs of different kinds reported the production of \$6,019,092 worth of products at a cost of \$2,447,313, including wages paid to the club members.

In the Southern States the girls worked with the women in the lines stated above, but about 400,000 boys had separate clubs. The total production of these clubs, including those for negro boys, was valued at \$12,000,000. The average yield of corn grown by club members was 42.8 bushels per acre as compared with the general average of 19.4 bushels in the Southern States.

As heretofore, in all parts of the country, numerous exhibits of club products were made at local and State meetings and fairs and prizes were awarded, which often enabled the recipients to attend short courses at the colleges, make observation trips, or prolong their school education. Cooperation with school officers and teachers continued on a large scale.

The work of extension specialists in the various branches of agriculture and home economics with headquarters at the agricultural colleges or the Department of Agriculture was materially

increased. These officers supplemented the work of the county agents, furnished them with advice and assistance, gave instruction in numerous movable schools and meetings, prepared publications, and answered inquiries. Among the things to which these specialists gave attention were the stimulation of pork, beef and egg production, introduction of pure bred animals, promotion of sheep raising, formation of cow-testing and bull associations, hog cholera prevention, making and use of cottage cheese, eradication of the harberry to prevent rust on wheat, pruning and spraying of orchards, grading, packing and marketing of fruits and vegetables, control of rodents and insects, improvement of crop rotation, demonstrations of tractors, farm management demonstrations, formation of marketing routes and organizations, instruction and demonstrations in food and nutrition, clothing, home hygiene and sanitation, and home decoration.

Extension work in Alaska, Hawaii, Porto Rico, and Guam was carried on through the Federal experiment stations. A number of farmers' meetings were held in the Matanuska and Tanana valleys in Alaska. Demonstrations in Hawaii included curing of pork, caponizing, production of concentrated feeds to replace grain brought from California, etc. In Porto Rico 1741 meetings were held and 500 field demonstrations were conducted. An active campaign to eradicate the cattle-tick was begun. In Guam the work included farm demonstrations, boys' and girls' clubs and school gardens.

Nearly 7000 farmers' institutes were held during 1919 in 31 States by the agricultural colleges or State Departments of Agriculture, with an attendance of 1,900,000.

The general interests of the cooperative extension work throughout the country continued to be promoted by two extension offices in the States Relations Service of the Department of Agriculture. The work in each State was administered by an extension director, with headquarters at the agricultural college, who was a joint representative of the Department and the College. Under the director were State and district leaders of county agricultural agents, home demonstration agents and boys' and girls' club work.

For the fiscal year beginning July 1, 1919, the total fund available for extension work in the States was about \$14,250,000. Of this about \$985,000 was derived from direct appropriations to the States Relations Service, \$296,000 to other bureaus of the Department of Agriculture, \$3,080,000 from Smith-Lever Act, and \$1,500,000 from the supplementary federal fund, making the total federal contribution \$5,861,000. This was met by approximately \$8,400,000 from sources within the States, including about \$4,000,000 to offset the regular and supplementary Smith-Lever funds, \$965,000 additional State and college funds, \$3,000,000 from counties and \$500,000 from farmers' bureaus and miscellaneous sources. About \$7,423,000 was used for the demonstrations and other activities of the county agricultural agents. Much of their work bore on problems of the farm home, but \$2,578,000 was allotted to distinctive work in home economics. About \$840,000 was used for work among boys and girls, and about \$2,180,000 was devoted to the tasks of the specialists.

AGRICULTURAL LEGISLATION.
UNITED STATES. Although very little distinct-

ively agricultural legislation was completed by Congress during 1919, farmers and their organizations were probably more influential in legislative matters than ever before. They were particularly interested in the repeal of the so-called Daylight Saving Law of 1918, experience having shown that it was seriously handicapping many farm operations. Efforts to secure this repeal through a clause in the belated Agricultural Appropriation Bill led to a presidential veto of this measure July 10. The appropriation act eventually became law separately on July 24 (for discussion, see AGRICULTURE, *U. S. Department of*), and the daylight saving legislation on August 20th, Congress overriding a second veto.

A proposed National Soldiers' Settlement Bill was generally opposed by farmers on the ground that the contemplated acquisition and improvement by the government of vast tracts of land for subdivision into farms for ex-service men might seriously injure existing farm enterprises. At the close of the year this measure was pending in the House following a favorable report from the Committee on Public Lands. Sixteen States, however, adopted State Soldier Settlement Acts, and South Dakota and Utah each appropriated \$1,000,000 to institute reclamation work.

Amendments to the Federal Food Control Act of 1917 were adopted extending its scope to containers in which foods, feeds, and fertilizers are sold. Penalties were provided for individual profiteering as noted elsewhere (see FOOD AND NUTRITION), but farmers and their organizations were specifically exempted from these provisions as regards farm products raised by them. In the course of the year, many of the States passed legislation facilitating the organization of co-operative agricultural associations, as well as regulating marketing practices, grading of produce, and similar matters.

There was a noteworthy tendency for the States to centralize their administrative and regulatory activities in departments of agriculture. Many inspection laws were broadened, notably to include seeds, insecticides and fungicides, and dairy products. Ten States strengthened their laws against bovine tuberculosis, and four required the extermination of the common barberry as a means of combating black rust of cereals. More stringent dog laws in the interest of sheep raising were passed by five States, and two more took other action to foster the industry.

FOREIGN LEGISLATION. Most of the comprehensive war measures remained in force throughout the year, though there was considerable relaxation of administrative regulations. A Soldier Settlement Act was passed in Canada appropriating \$25,000,000 for loans to discharged soldiers and sailors. Funds may be advanced to purchase and equip farms in any province, or to improve tracts on the public domain, and training is provided for those lacking experience. A Seed Grain Act permits loans to farmers suffering loss of crops. Under a Land Settlement (Facilities) Act passed in Great Britain the power of county councils to acquire land compulsorily was materially broadened, in the interests of aiding ex-service men and women engaged in agricultural work during the war to obtain farms. France provided for the acquisition by departments and communes of tracts for subdivision into small holdings, particularly for the benefit of families with little capital. See also **FORESTRY AND RECLAMATION.**

AGRICULTURAL POLICY. See AGRICULTURE AND SOILS.

AGRICULTURE. The cessation of hostilities in Europe brought little immediate improvement in its agriculture, which had been seriously crippled for four years; and the general unrest made conditions in some respects worse. It was obvious early in the year that Europe could not produce sufficient food for herself, and that most of the countries would be hard pressed until after another harvest at least. Food became the key to the whole situation and to the establishment of peace and order. It was estimated that in 1919 Europe would not produce more than 70 per cent of its food, and that it would need to import at least 20,000,000 tons of bread grains alone, of which some 11,000,000 tons must come from the United States.

PRODUCTION IN 1919. In planning the "liberty wheat campaigns" in the United States, the Department of Agriculture suggested a maximum fall sown average of 47,206,000 acres, an increase of 12 per cent over 1918. The response, however, was 49,905,000 acres of fall wheat, the largest in the nation's history, nearly 13,000,000 more than in 1918, and 15,809,000 more than the previous 5-year average. In addition, the spring wheat area was 23,338,000 acres, making the combined acreage of fall and spring wheat 73,243,000 acres, or 12,774,000 greater than any previous record.

Although the season was not favorable for the spring-sown crop, it is estimated that the total production of wheat amounted to 940,987,000 bushels, or 19,549,000 bushels more than in 1918 and the second largest wheat crop for the country.

The total area sown to the leading cereals in the United States for the crop year 1919 was greater by 33,000,000 acres than the pre-war average for 1910-14, and it is estimated produced 635,000,000 bushels more than that average. At the same time, the number of cattle, swine, horses, and mules was increased by a total of nearly 29,000,000 head.

The corn crop was one of the largest ever grown, estimated at more than 2,917,450,000 bushels, and nearly 169,000,000 bushels above the 5-year average. Oats, rye, and barley were each considerably lower than in 1918, and below the 5-year average except in the case of rye, which came into much prominence during the war as a food crop. The production of buckwheat was considerably larger than in recent years, and the rice crop was the largest ever grown in the United States, amounting to over 41,000,000 bushels and occupying a little more than a million acres. Kafir reached the large figure of 126,058,000 bushels, a great increase over the past three years.

The white potato crop fell off 54,000,000 bushels as compared with 1918, but the sweet potato crop was the largest ever grown, nearly 35,000,000 bushels above the 5-year average. The hay crop was approximately 12,000,000 tons above the average; while tobacco, next to the crop of 1918, was the largest of record, estimated at 1,389,458,000 pounds.

The total area planted in the principal crops in the United States is placed at 347,731,000 acres, compared with 345,959,000 acres in 1918. On the basis of recent prices, the total value of all crops produced in the United States in 1919 is estimated by the Department of Agriculture

AGRICULTURE

22

AGRICULTURE

at \$15,873,000,000. This compares with \$14,220,000,000 for 1918, and \$5,827,000,000 for the pre-war average, 1910-14.

The world crops as estimated by the International Institute of Agriculture were large, especially those of corn, rye, barley, rice, and potatoes. The production of wheat, oats, and flaxseed showed a decrease from the average for the five years ended 1917. These estimates include, of course, the crops of the United States. The British Board of Agriculture showed a slight increase in the area of cultivated land in 1919, as compared with the preceding year, but a decided decrease in the area devoted to cereals, amounting in the case of wheat to about 13 per cent in England and Wales. There was a decrease in the area of potatoes of nearly 25 per cent. As a consequence, the cereal harvest in England was below the average of recent years, and the potato crop while good was far short of that of 1918. There were corresponding decreases in live stock, the most disquieting feature being in respect to the prospect for milk and the falling off of young stock and sheep. While Europe may recover more rapidly agriculturally than otherwise, it will evidently continue to experience a considerable shortage of food supplies for the coming year, and all the central and western European nations will be compelled to import large quantities of cereals and meat products. The quantities that can be imported will be limited in part by the condition of credit and the exchange.

Australia, and especially New South Wales, suffered the most disastrous drought since it has been settled. Stock and crops have been extensively destroyed, and many settlers are reported to have been ruined. The severe drought in India continued to prevail. See also DAIRYING, LIVE STOCK, and the individual crops.

FARMING CONDITIONS IN EUROPE. Despite the unsettled conditions which followed the armistice, and the inadequate crops of the past season, there are indications that farming is being resumed on a considerably more extensive scale in the northern countries involved in the war. So far as its production of bread grains is concerned Bulgaria is rapidly returning to a pre-war basis, and in Southern Hungary about 90 per cent of the normal wheat acreage was sown, but Rumania is still far from complete recovery although more than self-supporting. It has been estimated that Hungary, Bulgaria, and Rumania together will probably be able to export over a million and a half tons of bread grains in 1920, as compared with nearly 4,000,000 tons in average pre-war years.

Peasants were returning to the land from which they were driven in Eastern Poland and Western Russia, but food conditions were very bad. The entire acreage in Germany is under cultivation but production suffers from a lack of fertilizers. The latter is true of other sections of northern Europe. See also FERTILIZERS.

In England and many other parts of Europe estates and large tracts of land are being cut up or limited in size. In Poland, Rumania, Croatia, and Slavonia, the governments are limiting the size of the estates to from 80 to 160 acres, the land in excess of these limits being distributed among the peasants.

AGRICULTURAL EXPORTS. The exports of food stuffs from the United States rose enormously during and following the war. The average ex-

ports of important cereals increased from 162,000,000 bushels in the five years preceding the war to 517,000,000 in 1915, and aggregated 448,000,000 bushels in 1919. Dairy products, of which an average of 25,000,000 pounds were exported during the 5-year pre-war period, increased in volume to 102,400,000 pounds in 1915, 217,500,000 in 1916, 352,000,000 in 1917, 592,000,000 in 1918, and 781,000,000 in 1919; while the exports of meat and meat products were 1,291,000,000 pounds for the 5-year average before the war, 1,500,000,000 in 1915, 1,800,000,000 in 1916, 2,300,000,000 in 1918, and 3,300,000,000 in 1919.

There is already a tendency for the exports of certain products to decline, and with a good season in Europe in 1920 there may be a return toward the pre-war normal in demand. See also DAIRYING, and LIVE STOCK.

PROGRAMME FOR 1920. Early in 1919 the U. S. Department of Agriculture called attention to the probable effect on the food situation of the signing of the armistice, the opening up of the channels of trade, and the resumption of agriculture in Europe. These changes it was to be expected might have a material effect upon the cereal and other requirements. On the basis of reports on foreign conditions and probable needs, the Department recommended a reduction in the wheat area of about 15 per cent. This would mean the planting of about 42,000,000 acres of fall-sown wheat and 20,000,000 acres of spring wheat, which would furnish an average production of 830,000,000 bushels, of which 200,000,000 would be available for export. The consumption of rye in the United States was stimulated by the war to about 50,000,000 bushels, which if maintained with the export of 25,000,000 bushels would call for an acreage of about six million acres, considerably less than that grown in the past two years. In view of all the circumstances, the Department recommended that safe farming should be followed, returning to a balanced agriculture and to the kind of farming best suited to local and individual conditions.

The continuance of energetic measures to increase the production of home-grown food was urged by the new Minister of Agriculture in Great Britain. It was held desirable that incapable or negligent farmers should be crowded out or otherwise eliminated.

EXPANDING PRODUCTION. Expansion of agriculture in the United States is limited by the supply of labor and capital rather than by the scarcity of undeveloped land. While in general the best land is in cultivation, much remains which will doubtless be tilled when the economic stage is reached to justify it. Many people have demanded rapid expansion and increased production as a remedy for high prices, while others deplore the great waste of unused land. Since the government land suited to farming is now largely gone, expansion in area will depend largely on efforts applied to private land, but as this would involve utilizing land which is inferior or require heavy expenditure to make it available, the Department of Agriculture has advised against stimulating a large increase in the area of farm land at the present time. Many efforts in this direction have resulted disastrously to settlers. The Department has combated the fallacy that an unlimited expansion of farming or an unlimited number of farmers is desirable, beyond the needs or the profitability of production.

The Board of Agriculture in England has issued a report showing some of the results achieved by the County Agricultural Executive Committees in expanding the area and improving the use of agricultural land. Neglected or badly farmed land has been taken over by these committees under the Defense of the Realm Act in practically every county in England and Wales, numbering over one thousand cases and totaling 64,000 acres. Some of these areas had been so far neglected that they required reclamation or restoration by drainage, clearing the brush, fencing, etc., and in this work German prisoners were employed to a considerable extent, as well as power machinery. Some of the results obtained were quite remarkable from a financial and emergency standpoint, and supplied striking object lessons. Over half the area taken possession of has been farmed by the committees, and it is expected that some of it will be acquired for land settlement.

Referring to the notion that American agriculture is deteriorating, the Department of Agriculture recently showed that this is not true in any significant sense, although production of some of the staples has not kept pace with population. The advance of agriculture has revealed itself in a greater diversity of products, the introduction of new crops, the increase in minor crops, and in supplying fresh products throughout the year. Even in the production of staples there has been a very marked upward trend in yield per acre. From 1890 to 1918 the acre-yield of wheat increased 25 per cent, or nearly 1 per cent per year on an average; that of corn 10 per cent, of oats 24 per cent, and of potatoes nearly 33½ per cent; while cotton showed an increase of 3½ per cent despite the ravages of the boll weevil. All other field crops likewise improved in yield, the average being 16 per cent per acre. The tendency is general throughout the Union, and is noticeable in the older sections like New York and New England. It is not due to a shifting of production.

This is a significant fact, and shows the error of the oft repeated statement that yields are declining despite the efforts of experimentation and education. A similar increase in acre yield is true in most other civilized countries. The yield is lowest for countries which have been expanding most rapidly and where extensive systems of farming prevail under cheap land and dear labor.

But despite this increase in acre yield, it is estimated that only about 15 per cent of the land in cultivation in the United States is yielding reasonably full returns. One of the objects to be attained is to promote increased yields along economic lines by the application of scientific knowledge and improved practices, and thus to bring the remaining 85 per cent up to the point of fair yield. The country is a long way from the limit of farm production, and at the proper time expansion can be effected by cultivating the tillable land which at present is unused, estimated to be over 60 per cent of the total area.

Recent statistics show that the total production of the average farm is greater in the United States than in any other country in the world. Taking both acreage and yield into account, the average American farmer produces 2.5 times as much as the average Belgian farmer, 2.3 times as much as the English, 3.2 as much as the French, 2.5 as much as the German, and over six times as much as the average Italian farmer.

The yearly value per acre of ten leading crops combined has been computed by the U. S. Bureau of Crop Estimates for each year since 1866. (*Monthly Crop Reporter*, June, 1919.) This value was the lowest (in recent years) in the period from 1893-99, \$8 to \$10, when it increased quite steadily to \$16 in 1909, declined slightly in the two following years, reached \$17.18 in 1915, \$22.58 in 1916, \$33.27 in 1917, and \$33.44 in 1918. This reflects the fluctuation in price and the large increase in value during the war.

AGRICULTURAL POLICY. The provision for a more definite governmental policy toward agriculture, in order to give greater consideration and security to the industry, has been the subject of considerable discussion during reconstruction. It is argued that this is of importance not only to farming and those engaged in it, but to the country at large. The broad relations of the industry and the necessity of fostering and developing it, supported by a prosperous rural population living under conditions which are attractive and satisfying, are seen as never before.

In the United States the president of the Association of American Agricultural Colleges and Experiment Stations, Dean E. Davenport, of Illinois, emphasized the great need at this time for the establishment of an agricultural policy, national in scope, universal in its interests, and comprehensive in its procedure; and recommended the provision of a permanent body to conduct broad and judicial studies of agricultural conditions and outline measures as the basis for such a policy.

President Wilson in his message to Congress referred to the vital service of farmers during the war, and declared "the importance of doing everything possible to promote production along economical lines, to improve marketing, and to make rural life more attractive and healthful," concluding with the suggestion of a comprehensive survey of rural conditions.

The Secretary of Agriculture has also pointed out the need of such a survey of rural life, its problems and relationships, as a result of which "the principles and purposes governing agricultural life and agencies should be set forth for the education of the American public, particularly the urban part of it." The provision of a comprehensive flexible programme in relation to agriculture would call for a conference of farmers, agricultural leaders and business men, and the Secretary indicated that the President had under consideration the calling of such a conference.

The general unrest in this country and the widespread protest against the high cost of food products have shown the lack of understanding of the farming business, and especially of the relatively small return received in the past for labor and investment in it, as compared with other industries. The farmers have begun to make themselves felt as never before, and are increasing and strengthening their organizations to protect their interests. It seems clear that there will not be a return to former conditions, and that larger public recognition will be demanded for this industry and its people.

In Great Britain the importance of food production was forced home by the war and by the decline in exchange since its close. Agriculture was stimulated by Governmental action as a war measure, but since the armistice public interest in maintaining and developing it has languished.

and doubt as to the attitude of the government has created great uncertainty on the part of farmers and land owners. The cultivated area has already begun to decline, and although about 1,750,000 acres were added to this area during the war the country is now some 3,000,000 acres behind the standard of 1870.

The seriousness of the situation is further shown by the unprecedented sale of land, which it is predicted will result in more than a million acres changing hands this year. Many large estates are being broken up, and the papers are filled with advertisements of land and country places for sale. In a country where land has been scarce and closely held, the condition is attracting much attention and is being deplored as an increasingly disturbing factor. These sales have created a sense of insecurity in the minds of tenants, which contributes to the concern for local food production.

Willingness to dispose of land is accounted for in part by the social upheaval, taxation, high rates of interest, and uncertainty as to future agricultural policy. Land owners encountered many difficulties during the war and were heavily taxed. Everybody else connected with land had a chance of improving his condition, but land owners were not permitted to raise rents and were subject to action if their lands were not effectively farmed. Tenants made money and feeling the strength of their position are exacting better terms, agitating for greater security of tenure and other conditions. Laborers are scarce and are also demanding greater consideration in the way of wages, hours, housing conditions, etc.

While government guarantees and the compulsory cultivation of the land have been continued, they are only temporary, and consequently the demand for a permanent agricultural policy has become insistent.

In response to this demand, Premier Lloyd George in a notable speech to a gathering of landowners, farmers, and representatives of labor on October 21st, outlined the plans of his government for a policy toward agriculture. This speech is the more noteworthy as being the first address on agricultural matters by a head of the government to a representative agricultural audience within the memory of those who heard it.

The Premier declared the vital interest of the government in a progressive agriculture, which should produce all the food the land is capable of producing, thus insuring safety not only from future submarines but from economic disaster. The policy he outlined was the guaranteeing of minimum prices, especially for wheat and oats, extending over a sufficient period of years to protect the producer against loss due to violent fluctuations in prices of foreign cereals, and to take into account the increased cost of production. This matter of the guarantee is now before a royal commission, which will advise as to its amount and duration. He also strongly advocated provisions which will give greater security to both landlord and tenant in the matter of tenure and rents, coupled with the condition that good farming be required. He urged a generous minimum wage for farm labor, and on the other hand cautioned labor against taking advantage of the situation to drive a hard bargain. He advocated the provision of long and short term credit for landlords and farmers by the banks, and more adequate transportation facilities throughout the country.

The plan outlined by the Premier has not been crystallized into law and is undergoing discussion, as was to be expected. Considerable objection appears to have developed to the fixity of tenure feature, which is thought to unduly protect the farmer and bad farming and to encumber the sale of land.

FARM LANDS AND SETTLEMENT. Interest in agricultural land and in land settlement was greatly stimulated by the high prices of food products and the return of ex-service men who wished to obtain farms. It was a natural outgrowth of the larger appreciation of the importance of land and of local production.

An attempt has been made by the National Institute of Agriculture to estimate the world's productive land. Data collected from 36 countries having a total land area of 15,071,209,000 acres, approximately half that of the entire world, showed that 4,591,691,000 acres, or 30.5 per cent, are productive, and that 1,313,832,000 acres, or only 8.7 per cent, are cultivated. The latter includes that in fallow and in grass. The productive land includes besides that cultivated, natural meadows and pastures, forests, woodlots, and land devoted to cultivated trees and shrubs. The proportion of the total land area in cultivation is therefore comparatively small.

In the United States the value or price of farm lands has increased steadily, the average value of medium grade plow land being about \$74.31 per acre on March 1, 1919, as compared with \$68.38 a year previous, \$62.17 in 1917, and \$58.39 in 1916. The percentage increase during the past year was largest in the South Atlantic States and in Kentucky and Arkansas. Material increases were reported in Nebraska and South Dakota. Land values were highest in Iowa, the average being \$169 an acre, followed by Illinois with \$144. What was said to be a record price for a quarter section of farm land in Central Illinois was reported during the year, the price averaging \$687 50 an acre.

There has been much speculation in farm lands, and large profits have been secured without adding anything substantial to the value. High prices have induced farmers to sell, only to find that they must pay higher prices to secure equally desirable land. The Department of Agriculture has warned farmers against paying fictitious prices, which on a return to normal conditions may yield such small returns on the investment as to embarrass the purchaser if he has bought largely on credit.

A Federal measure for enabling discharged soldiers and sailors to acquire farms under favorable conditions, involving quite extensive reclamation schemes, was advocated in the United States and found considerable support, but failed of favorable action in Congress. Many of the States gave attention to setting forth the opportunity for soldiers to settle on farms, and there was considerable organized attempt at the camps to interest soldiers in agricultural matters.

In Canada an act was passed under which discharged soldiers and sailors may acquire 160 acres of land, and a maximum loan of \$2500 at 5 per cent to construct buildings and purchase stock and equipment.

The object of the government land settlement policy in Great Britain is not only to satisfy the demands from ex-service men, but also to secure an increase in rural population and greater home production of food. The Board of Agriculture

has had the power to acquire land under certain conditions, but relatively slow progress has been made on account of unavoidable delays. In September it was reported that there had been over 25,000 applications for land, aggregating nearly one-half million acres, largely from ex-service men. The plans had waited to considerable extent on the provision of a capital sum for acquiring land, and in October a land settlement act was passed which provided £20,000,000. It very considerably strengthened the powers of the County Councils to acquire land by purchase or rental, permitted them to purchase on the basis of a perpetual annuity, and shorten the time and process of obtaining possession. The sale of holdings is greatly facilitated by reducing the first payment and permitting installments to extend over 60 years. For the next two years preference is to be given in sale or rental of small holdings to ex-service men and women (the latter in agricultural work). Loans for the purchase of live stock, fruit trees, seeds, fertilizers, and implements are authorized. These functions of the councils are subject to approval by the Board of Agriculture.

The assistance given to French farmers in the recently occupied areas has been extended to those wishing to acquire farm land to replace that damaged to such an extent that it is incapable of cultivation within a reasonable time. Grants may be paid to such persons under regulations prescribed by the Minister of Liberated Regions.

New Zealand has made provision for settlement of its discharged soldiers on the land, which is reported to be progressing rapidly. A considerable number of the British Expeditionary Force have also acquired land under these provisions. The tenures under which land may be held are especially suited to meet the needs of soldiers. An advance of £2500 may be made to assist in acquiring freehold land or land held under lease from a land board, the purchase price with interest at 5 per cent being payable in installments over a period of 36½ years.

In Belgium lands in the war zone devastated by shell fire will be taken over by the government, the farms worked and finally turned back to the original owners in good condition. The government will pay 5 per cent interest on the pre-war value of such lands while carrying them on, and is also prepared to buy them outright if the owners wish to sell.

Land reclamation was carried on in Germany during the war with the aid of prisoners. A writer in the *Journal of the Board of Agriculture* (October, 1919), describes the reclamation of a tract of 18,000 acres near Hanover, on which he was employed.

The long-projected plan for reclaiming the land covered by the Zuyder Zee in Holland has been begun. This involves the reclamation of about 800 square miles flooded by the sea 700 years ago. The area is expected eventually to support a population of nearly 250,000 persons. The work is to be spread over 20 years, and will cost about \$100,000,000.

A royal decree has recently been issued in Italy looking to the proper use of land in the production of food. The withholding from cultivation of large tracts which neither the land owners nor the State seemed disposed to develop or to lease on favorable terms, has aroused much dissatisfaction, and in August such tracts in

200 localities near Rome were seized by farmers, chiefly at the instigation of the League of Fighting Soldiers. This led to the decree, which secures for four years farmers belonging to legally constituted agrarian associations, and under certain provisions permanently, the land owners to receive fair compensation. The decree also provides for granting State assistance when desirable.

FARM LABOR. The situation in the United States was less serious than in the previous year, but there was still considerable difficulty in getting experienced labor for special forms of work or at times of pressure. Concessions have had to be made to laborers in the matter of hours and conditions, as well as of wages. The latter have reached unprecedented figures, especially for day labor.

Wages for farm labor in the United States have more than doubled since 1902 and have increased from 43 to 64 per cent for the different classes of hirings since 1916, or a general average of 53 per cent. In the past 25 years, dating back to the industrial depression of 1893-97, the rates for farm labor have increased from 165 to 229 per cent for different classes of hirings. Day wages have increased in greater proportion than wages by the month, and wages for work outside of harvest have advanced more largely than those for harvest work.

In England the labor question has become the most difficult of all with which agriculture is confronted. The supply has become short, and wages, hours, and living conditions have sprung into unusual prominence, causing great anxiety among farmers. Under the Corn Production Act, passed during the war, farm labor was guaranteed a minimum wage. The Premier and the President of the Board of Agriculture have both defended this, and have declared that wages and living conditions in the past were scandalous, and an injury to the best interests of agriculture. It is contended that farming can be adjusted so as to enable a wage comparable with that of other labor in rural localities; and laborers have been counseled in their own interest to be reasonable in their demands, and not to agitate for the inclusion of farm labor in the 48-hour bill, which would be fatal to agriculture.

German prisoners of war continued to be considerably used in farming operations in Great Britain, and there was considerable regret on the part of farmers when they were released in the fall.

A new agricultural laborers' code was issued in Germany early in the year, which aims to regulate conditions of labor on the land, to check exodus from the rural districts, and to attract urban wage earners to agriculture.

The first annual convention of the Women's Land Army of America was held in Philadelphia early in the year. The Women's Land Army of England and Wales was disbanded at the close of November. Starting in the face of much prejudice and skepticism, the women won the gratitude of their employers and the admiration of the country. Premier Lloyd George paid a high tribute to them. They will be encouraged to remain in farm work as their services are still needed.

The first recruits were enrolled in March, 1917, and 23,000 were subsequently selected and placed, 15,000 receiving short courses of training. Two rewards of merit were given, the Good Service

Ribbon awarded to all workers who completed six months of satisfactory service, and the Distinguished Service Bar given for acts of courage, devotion to service, and special skill. Of the latter 46 were awarded.

FARM ORGANIZATIONS. During the war the farmers felt the need of representation through their larger National bodies, and the National Board of Farm Organizations was formed with headquarters at Washington. This was an attempt at a union of these bodies to promote and give publicity to matters of common interest. It is announced that this organization will build a "temple of agriculture" in the national capital, at a cost of \$1,250,000, as a general headquarters for the organized farmers of America.

The influence of the farmers was seen in the repeal of the Daylight Saving Law, which they regarded as disadvantageous to their work; and they have taken an increasing interest in labor legislation in its possible relation to hours and wages. They were represented at the industrial conference convened by the President in October, where the claims of agriculture were presented and the need for a considerate policy which would provide certain remedial measures was urged.

An organization which is potentially one of the largest organizations of farmers in the United States was effected in Chicago, in November, through the formation of the American Farm Bureau Federation. This is an outgrowth of the farm bureaus organized in the counties of many States, to support the agricultural extension work. These county bureaus have been federated in several of the States, and have come to represent the farmers in their broader relations. The object of the national federation is to correlate and strengthen the State farm bureaus, to promote, protect, and represent the business, economic, social, and educational interests of the farmers of the nation, and to develop agriculture. Ample funds are provided, and a paid secretary is to conduct the general business. (See also AGRICULTURAL EXTENSION WORK.)

Farmers in France are taking steps to form a national association which will include all present farm organizations of that country. French farmers feel the need of an organization to defend them against unfair charges and to represent them in national affairs.

The growth of coöperation, especially in marketing, in the United States is illustrated by the fact that no less than a billion and a half dollars worth of agricultural products are now marketed by coöperative agencies annually. Farmers' exchanges and coöperative associations organized with the aid of extension agents did business amounting to about \$42,000,000 the past year.

The human side of agriculture, the conditions of country life, its school facilities, healthfulness, means of communication, and comforts are receiving greatly increased attention from many sides. The Country Life Conference, organized early in the year, has become a large and quite influential body dealing with these matters; and the American Farm Economics Association has taken active hold of the problems in the field of rural economics and sociology. Both organizations held important meetings at Chicago in November. The farm management work of the Department of Agriculture has been given new direction, and broadened in scope to take in rural life questions; and marketing studies and aids

are rapidly developing in the States and under the federal government.

The Secretary of Agriculture has advocated the development of strong State departments of agriculture and has pointed out the special field of such departments as distinguished from those of the agricultural colleges. A general understanding has been entered into between the State departments or boards and the agricultural colleges, under which the latter would confine themselves in general to investigational and educational work, both at the colleges and in the field, and the departments or boards of agriculture to administrative and regulatory matters. The departments have been reorganized in a number of States in accordance with this general plan. A new department of agriculture was established by State law in Idaho, a commissioner being appointed and a board of nine agricultural advisers. Regulatory duties, agricultural fairs, and the promotion of marketing are to constitute its principal duties.

The type of administrative officers of these departments is also changing, recent appointments in a number of the States having been made of men especially qualified through education and experience. During the year Prof. Fred Rasmussen, professor of dairy husbandry at the Pennsylvania State College, was appointed secretary of agriculture in Pennsylvania, and Dr. A. W. Gilbert, formerly professor of plant breeding and a specialist in the wider ranges of agronomy, was appointed commissioner of agriculture in Massachusetts.

In England the Right Hon. Lord Lee of Fareham succeeded Lord Ernle (Mr. R. E. Prothero) as President of the Board of Agriculture, and under his direction the board was reorganized into three main departments, each headed by a director general. In Canada Dr. Simon F. Tolmie was appointed Minister of Agriculture, and Dr. J. H. Griswold Deputy Minister. Provision has been made in France for departmental and regional chambers of agriculture; and a royal decree in Spain established an official chamber of agriculture in each province. The restored Polish State has founded a department of rural husbandry.

David Lubin, founder of the International Institute of Agriculture at Rome, and the American representative on its permanent board, died early in the year.

NEW BOOKS. The effects of the war on agriculture are shown in a volume by Prof. B. H. Hibbard entitled *Effects of the Great War upon Agriculture in the United States and Great Britain*, issued by the Carnegie Endowment for International Peace (Washington). The rural problem, rural organization, and rural democracy are treated in *The Farmer and the New Day*, by President Kenyon L. Butterfield (New York, 1919); and an analysis of the factors and problems of rural life is presented in *Rural Life*, by Prof. C. J. Galpin (New York, 1918).

AGRICULTURE, UNITED STATES DEPARTMENT OF. In his annual report for 1919 the Secretary of Agriculture calls attention to the great service which American farmers rendered to the innoverished people of Europe by producing food in such abundance that vast quantities of bread grains, meats and fats were available for export.

In 1919 American farmers planted an acreage in leading cereals greater by 33,000,000 than the

pre-war annual average, with an estimated yield of 635,000,000 bushels more than the average and increased the number of milch cows over 1914 by 2,700,000, of other cattle by 8,500,000, of swine by 16,700,000 and of horses and mules by 1,000,000, or a total of 28,900,000.

The exports of foodstuffs, enormous during the war, rose greatly between the armistice and the midsummer of 1919, including 448,000,000 bushels of cereals, 781,000,000 pounds of dairy products, and 3,300,000,000 pounds of meat and meat products. The total value of the crops produced in the United States in 1919 was \$14,000,000,000 as compared with \$6,112,000,000 in 1914 and the value of livestock on farms in 1919 was \$8,830,000,000 as compared with \$5,890,000,000 in 1914. "The increased values reveal that the monetary returns to farmers have increased proportionately with those of other groups of producers in the nation and that their purchasing power has kept pace in the rising scale of prices."

He also presents evidence showing that, contrary to what is often asserted, there has been in recent years an upward tendency in the acre yields as the result of improved processes and better practices and that this is so even in the older regions, such as the New England and North Atlantic States. Among the factors which have contributed to this result are the use of more efficient farm machinery, better crop rotations, better crop adaptations to soil and climate, planting of varieties resistant to diseases and insects, more prevalent control of diseases and insects, increased and more intelligent use of fertilizers. While some other countries produce greater yields per acre due to more intensive cultivation with cheap labor the American farmer produces more per man on larger areas. For example, in Belgium, 5.3 acres are cultivated for each person engaged in agriculture, whereas in the United States the corresponding figure is 27 acres. In this connection it is also well to remember that the United States has the most widespread and effective system of research and education in agriculture through its national and State departments of agriculture, agricultural colleges and schools, experiment stations and extension agencies.

The Secretary also combats the too prevalent notion that there should be a rapid expansion of the area of cultivated land and holds that "it is not in the interest of producers or consumers to have large fluctuations in agricultural production. There will be farmers enough, if the business of farming is made profitable and if rural life is made attractive and healthful. The consumers must be willing to pay prices for farm products which will enable farmers to produce them and to maintain a satisfactory standard of individual and community life."

Good schools and roads are requisite. Sanitary and medical services, including hospital facilities, are among the things which country people must have to make them willing to stay on the land.

Expert investigation, service and advice should be invoked to aid in the problems of further expansion of the cultivated area and the plans for land settlement. Neither sentiment nor selfish greed should be allowed to determine the policy of the country on those matters. The advantages of tenancy under proper conditions for young men as a means of acquiring experience in

farm management and accumulating capital to purchase and operate farms is pointed out, as well as the need of improvement in the conditions of leasing and measures to make the road to farm ownership as smooth as possible. A warning against the rising tide of land speculation is also given.

The adoption of a more comprehensive and effective forestry policy by both the States and the nation is strongly urged. The care and development of farm woodlands, and in general the better management of private forests is essential. The area of public forests should be extended through federal and State legislation. Adequate fire protection under public auspices should be provided.

The plans of the Department for the expansion of its organization and work relating to agricultural economics and sociology are described and it is again recommended that the present Office of Farm Management be changed to a Bureau of Farm Management and Farm Economics. Further development of the crop and livestock reporting service and the market news service is also urged. The rapid progress in formation of farmers' cooperative organizations is shown. It is estimated that such associations now market annually \$1,500,000,000 worth of commodities. As a rule they have been successful where they have centred their activities on some one product or on related products in a given area. The Department, through its Bureau of Markets, and the cooperative extension agencies in the States and counties are greatly stimulating and guiding this movement. Great progress has been made in the construction of good roads under the Federal Good Roads Act. The approved projects call for the construction of 18,596 miles of road at a cost of \$225,267,847, of which the federal contribution will be about \$95,500,000. During the next two years at least \$1,000,000,000 of federal and state money will be available for road improvement. The Secretary opposes the suggestion that federal supervision of highways should be taken from the Department of Agriculture and placed under a federal highway commission, which in his opinion would be more expensive and less satisfactory to the States than the present organization in the Bureau of Public Roads.

A brief summary is given of the federal legislation enacted during the past six years for the promotion of agriculture, including the establishment of the Bureau of Markets, the Smith Lever Agricultural Extension Act, the cotton futures, grain standards, warehouse, road aid, reserve banks, farm loan, and vocational education acts. Additional measures are recommended as follows: A system of personal credit unions, primarily under State law especially for the benefit of farmers of small means; expansion of existing agencies for aiding farmers in marketing and stimulating cooperative enterprises; regulation and control of stockyards and packing houses; further protection of consumers against misbranded, adulterated and worthless feeds and fertilizers; increased support of rural schools by the State and more definite instruction relating to rural problems and conditions; and legislation to improve rural sanitary conditions and provide hospital and medical facilities for country people.

The regular appropriations for the Department for the year ending June 30, 1920, amounted to

\$33,900,211, an increase of \$6,024,858 over those for 1919, but the war emergency appropriation of \$11,346,400 was discontinued. However, under permanent appropriation acts the Department controls the expenditure of additional amounts, aggregating \$28,235,000, the most important items being the road fund of \$21,000,000, the extension fund of \$3,080,000, and the meat inspection fund of \$3,000,000. The appropriation for indemnities to owners of tuberculous animals was increased to \$1,500,000; for combatting the European corn borer, recently introduced into Massachusetts, \$250,000; for further purchases under the Appalachian Forest Reserve Act, \$600,000; for establishing a licensing system for the stockyards, \$75,000. The funds for controlling various plant diseases and insect pests were considerably increased. The regular appropriation for the Bureau of Markets was increased from \$2,023,255 to \$2,811,365. The appropriations for the Forest Service aggregated \$5,966,869, but this will be offset by receipts from the national forests, which in 1918 were \$3,574,930.

The Urgent Deficiency Appropriation Act, approved Nov. 4, 1919, added \$45,000 for control of the Japanese beetle and \$2,950,000 for protection against forest fires.

AIRPLANE. See AERONAUTICS.

AKASHI, MOTOJIRO. Japanese governor of Formosa, died at Tokio, October 24. He was born in 1864 and studied in Germany. During the war between China and Japan he was on the staff of the guard division. From 1907 to 1914 he was commander of the gendarmes, and inspector-general of police in Korea. Shortly before his death he had been raised to the command of the sixth army division.

AKRON, OHIO. See GARBAGE.

ALABAMA. **POPULATION.** According to the census of 1910, there were 2,138,273 residents of the State on January 1st, and on July 1, 1919, the population was estimated to be 2,426,602, a gain of 31,000 in the year.

AGRICULTURE. The following table is compiled from the estimate of the United States Department of Agriculture, for the month of December, 1919, covering the year 1919:

Crop	Year	Acreage	Produc.	Bu.	Value
Corn	1919	4,334,000	62,843,000	\$99,920,000	
	1918	4,378,000	63,919,000	94,600,000	
Wheat	1919	138,000	1,242,000	3,043,000	
	1918	162,000	1,458,000	3,572,000	
Oats	1919	372,000	6,696,000	7,031,000	
	1918	428,000	8,132,000	8,701,000	
Tobacco	1919	3,000	a1,890,000	567,000	
	1918	1,500	a1,050,000	315,000	
Rye	1919	4,000	88,000	99,000	
	1918	4,000	44,000	115,000	
Rice	1919	600	16,000	43,000	
	1918	600	15,000	22,000	
Potatoes	1919	44,000	3,520,000	7,568,000	
	1918	60,000	4,800,000	8,688,000	
Sweet potatoes	1919	151,000	14,194,000	16,139,000	
	1918	145,000	14,208,000	16,339,000

TRANSPORTATION. During the year 1919 there was built in the State, by two companies, 11.50 miles of first track.

LEGISLATURE. The quadrennial session of the Legislature of Alabama was held early in the year. An early summer recess delayed final adjournment until September. Under the leadership of Gov. Thos. E. Kilby the Legislature enacted a number of measures of far reaching importance. Among the more important of these were: A workmen's compensation law finally agreed upon by special civilian committees representing employer and employee; a special tax of three cents a ton on iron ore and two cents a ton on coal produced in the State was levied; a State income tax modeled after the federal tax was imposed; two important amendments to the constitution were submitted to be voted upon early in 1920. One provides for the issuance of \$25,000,000 road bonds and all automobile license taxes are set aside to pay interest and provide a sinking fund for these bonds. The other amendment gives a number of the cities of the State power to increase their tax rate to provide for local needs. The Legislature also formally rejected the woman's suffrage amendment to the federal constitution; special prohibition enforcement laws were enacted, a State enforcement bureau being created with funds to carry on the work.

POLITICS AND GOVERNMENT. In September C. B. Rainey, Democrat, was elected to Congress over J. R. Kennamer, Republican, in the 7th Alabama district to succeed John L. Burnett. One of the important industrial events of the year was the opening of the Warrior River to navigation, the first ship steel going from Birmingham by water to Mobile in November. The Port of Birmingham corporation was formed during the year and began building river terminals at Short Creek on the Warrior to handle Birmingham traffic. The port was scheduled to begin operations Jan. 1, 1920. The railroad administration during the year allowed new freight tariffs giving the water route from Birmingham to the gulf a 20 per cent reduction from the rail rate. It is expected to be very important in handling coal and iron to tidewater. In November the shipping board allowed a differential of \$1.50 per ton on coal from Gulf ports as compared with Atlantic ports on coal for South and Central America. With the European coal supply curtailed this is expected to be of great advantage to the Alabama coal fields. The nationwide coal strike called in October never became serious in the Alabama field. Production was probably cut 50 per cent during the first two weeks. After that there was a steady increase to normal which had been reached some time before the strike was finally called off. The steel workers' strike created scarcely a ripple in Alabama. Early in December floods did serious damage in South Alabama, especially in the vicinity of Montgomery and along the Alabama River. The heaviest loss was in the destruction of livestock. See CHILD LABOR; COTTON; WORKMEN'S COMPENSATION.

ALAMEDA, CAL. See CITY PLANNING.

ALASKA. No other portion of the United States has suffered as seriously from the economic conditions caused by the world war as Alaska. To an extent unequalled elsewhere her men of military age responded to the call of the nation, thus causing in the territory an unprecedented scarcity of labor. Supplementary to this shortage, the lack of transportation, the cost of food, the increased scale of wages and

the enhanced prices of materials not only seriously interfered with current industries, but also suspended almost entirely further development of local resources. Floods and famine, and especially the influenza epidemic further depressed Alaskan prosperity. While increased prices of furs, metals and fish prevailed, yet the entire volume of local products, unprecedentedly large in 1917, decreased materially in 1918 and to a far greater extent in 1919.

The territory yet suffers from divided and inefficient methods of national control. Forestal reservations and withdrawals are administered by no less than seven executive departments, and fish canneries deal with three. Congress has ignored recommendations to subserve Alaskan interests through the concentration of national bureaucratic authority in the hands of territorial officials, and by vesting most other powers in the Interior Department.

The most hopeful material factors in the prosperity of the territory have been the uninterrupted recuperation of the Pribilof seal-herds under the judicious policy of the U. S. Bureau of Fisheries, the natural increase in the reindeer herds, an enlarged utilization of forestal resources, and particularly the steady progress in the construction of the governmental railroad. Morally, should be noted the gradual improvement in the status of the natives as regards education, labor methods, thrift and in the extension of self-government. Among the whites the problems of prohibition, labor-regulations and other progressive methods have been quite satisfactorily accepted and adjusted. While this interruption to the remarkable prosperity of Alaska in the past has been depressing, yet improved conditions may be reasonably expected with the completion of the governmental railroad, the restoration of oceanic transportation, and increased metallic outputs.

POPULATION. The exodus caused by the world war reduced the white population to a minimum of about 30,000 in 1918. Although somewhat increased yet the whites were estimated by Governor Riggs at about 32,000 in 1919. The influenza of 1919 caused a large number of deaths among the natives. The disease followed the line of steamer travel and infected all coastal settlements. A timely embargo on travel to the interior protected such sections. Most of the 1500 deaths were on Seward peninsula, in Nome and neighboring localities. In many Eskimo villages it is reported that every adult died, and of an Aleut and half-breed population of about 900 in one locality the only survivors were 238 children. Congress oblivious of its treaty obligations with Russia refused to make an appropriation for its wards. When the worst of the epidemic was past the Red Cross lent some financial assistance and sent a few nurses and doctors to Alaska on a naval collier. However, the financial burden of more than \$120,000 fell on the local authorities already suffering from business depression.

LEGISLATION. The territorial legislature held its fourth biennial assembly in March and April, 1919, and enacted 59 laws. Supplementary to an appropriation of \$92,400 for relief purposes a special appropriation of \$93,000 was made for the sufferers from influenza, of whom 90 per cent were natives. Among the more important laws were new and increased taxes on fish products; prohibiting the pollution or obstruction of salm-

on streams; sanitary inspection of fish establishments; the creation of a ship and of a fish commission defining criminal syndicalism and prescribing punishment therefor; and fostering Americanism by establishing citizen night-schools, etc. Territorial finances felt the general strain. The total receipts for 1918 were \$475,450 while the appropriations by the legislature aggregated \$682,493.11. The most important legislation by Congress for Alaska was the act increasing the limit of the cost of the United States railroad from thirty-five to fifty-two millions, and an appropriation of \$6,000,000 for continuing the work.

COMMERCE. The value of American shipments into and from Alaska, which in recent years had steadily increased, suffered the past year very large reductions—approximately fourteen and three-fourth millions. The values for recent years are: 1916, \$97,970,650; 1917, \$121,265,947; 1918, \$131,767,788; and 1919, \$117,018,135. The greatest loss in values was in metallic products, the twelve million dollars being about equally divided between copper and the precious metals—gold and silver. Considerable offsets were gains of a million of dollars in fur products and of five millions in fish values. It should be borne in mind that the significance of these comparative values is impaired by the steady inflation of prices since the beginning of the world war. In quantities the larger gains in outward shipments were 2679 fur-seal skins, and 41,777,114 pounds of canned salmon. The more important losses are fresh fish, 5,856,154 pounds; copper, 23,286,335 pounds, and gold and silver to the value of \$3,792,736. The decreases of shipments inward were quite regularly distributed, aggregating \$8,736,041, of which the most valuable are steel-rails, 7853 tons, and tin plates—for fish industries—4,534,419 pounds. Commerce suffered sadly from insufficient and irregular oceanic transportation, which was reduced about one-half for all ports, while it practically ceased at some stations.

AGRICULTURE. The persistent efforts of the U. S. Department of Agriculture to promote agricultural industries in Alaska have been far more successful than was generally expected. The great extent of the territory and the very wide diversities of climate and of soil have been wisely recognized by the establishment of five experimental stations,—Sitka, largely horticultural; Rampart, forage plants; Kodiak, stock-farming; Fairbanks, model-farming; and Matanuska, dairy and vegetable. The pioneer farmers have greatly benefited by such experimental work. The central Tanana valley is the section that has been most extensively occupied by farmers, and in the Fairbanks district there are now 93 homesteads comprising 22,613 acres. The farmers of the Tanana are yearly growing large crops of Siberian wheat and other hardy grains, and the productivity is such as to promise at an early date sufficient grain to furnish wheat for the entire Yukon valley. At present local needs are largely met through the installation of a flouring mill which is available for grinding wheat there raised. Along the branch railroad in the Matanuska valley many homestead entries have been lately made and truck farms were successfully cultivated during 1919. Outward shipment of vegetables from this section indicate the scope and value of these farming industries. When the railroad is operated

from Seward to Fairbanks the Tanana products will enter this channel of traffic.

FISHERIES. The annual report for 1918 of Dr. H. M. Smith, U. S. Bureau of Fisheries, contains the latest complete data on Alaska fisheries. As in recent years fish is the most valuable of Alaskan products, being in 1918 three and a half times greater than that of copper, the next product in rank. The extent of the fishery industries appears from the investment of \$73,750,789 in 1918. The force employed, 31,213, consisted, in its principal components, of 17,693 whites, 5251 natives and 5581 Orientals, of whom there were 14,657 in southeastern, 6219 in central and 10,337 in western waters. The total value of fishery products increased from \$51,476,980 in 1917 to \$59,154,859 in 1918. In the latter year 90.5 per cent pertained to salmon, 3.1 to herring, 2.9 to halibut, 1.6 to cod and 1.4 to whales. Judged by the shipments from Alaska of fish during the nine months ending September 30 the fishery products of 1919 will approximate \$60,000,000 in value. There are however large decreases in amounts, approximately 19,000,000 pounds of salmon and 1,500,000 of other fish, principally those shipped fresh. Among the minor fisheries the following are noted: Owing to the introduction, through the U. S. Bureau of Fisheries, of the Scotch curing method, the herring industry has greatly increased, and has displaced halibut as the second fish of value. The personnel and investment in the herring fishery increased from 214 and \$562,002 in 1917 to 884 and \$1,802,000. The aggregate value also increased from \$1,051,089 to \$1,802,817, and the Scotch-cured product of 9,744,175 pounds, exceeded the Norwegian-cured by 775,660 pounds. Judging from the shipments up to September the value of the herring products will approximate \$2,500,000 in value. The halibut fishery affected by the war in 1917, increased its output to a value of \$1,667,686 in 1918, when its personnel of 1186 caught 13,869,706 pounds. The whaling fishery of 325 persons caught 448 whales in 1918, 25 more than in the preceding year. Serious depletion of the clam beds reduced that industry in 1918, but trout increased from \$16,896 to \$33,684 in 1918. Cod fishery remains about stationary, being valued in 1918 at \$957,184.

The salmon holds its own as the predominant product of Alaska. The over-exploitation of the fisheries, encroachment on the spawning streams, and invasion of streams which serve as food supplies for the natives have caused grave fears for the future, which the reduced catch of 1919 appears to justify. The U. S. Bureau of Fisheries, in whose charge the salmon fisheries are entrusted has had great difficulty in enforcing existing laws, and in conserving the salmon fishery as a perpetual source of wealth to the nation. The salmon industry has grown to enormous proportions and in 1918, the last year of which full data are available, the invested capital exceeded \$66,000,000 and gave employment to 27,969 work people, with wages of more than \$25,000,000. Besides the canned fish, later considered, the salmon products were thus valued: Mild-cured, \$607,951; pickled, \$1,079,881; frozen, \$170,864; fresh, \$386,576; dry-salted, \$47,544; dried and smoked, \$140,000; by-products (oil and fertilizer) \$35,423.

SALMON CANNING. The canneries in late years produced the following number of cases of 48-

pound standard: 1916, 4,900,627; 1917, 5,947,286; 1918, 6,605,835; while that of 1919, estimating from shipment to October 1, about 5,500,000 cases. Both in quantity and in value the pack of 1918 far exceeded any previous output. Backed by an investment of \$63,901,397, the 26,502 employees in the 135 canneries put up 6,605,535 cases having a value of \$51,041,949, exceeding the catch of 1917 by 658,549 cases. The percentage by species, and the value per case in 1918 were: 38 per cent ted or sockeye, \$9.44; 37 humpback or pink, \$6.58; 21 chum or keta, \$6.27; three coho or silver, \$9.15; and less than one per cent king or spring, \$9.85. Pushed to the extreme the salmon fishermen exploited new streams, encroached on prohibited waters, interfered with the spawning fish, and entered preserves heretofore utilized solely by natives. The outcome of these extensions created fears of over-exploitation, which in a measure appear to be justified by the decreased products of 1919. Supported by the more progressive salmon companies, the U. S. Bureau of Fisheries used its limited force and vessels to protect the hatcheries, prevent fish-piracy, to safeguard the interests of the natives and the fishermen equitably. After public hearings limitations and prohibitions, which went into force on Jan. 1, 1919, were promulgated by the Secretary of Commerce, under Section 6, act approved June 26, 1906, as to the Yukon and Copper Rivers, and the streams of southeastern Alaska. Limitations and prohibitions also obtain as to Wood and Nushagak Rivers, all streams flowing into Cook Inlet, Eyak Lake, Eyal River, Yes Bay and stream, and the reserves of Afognak, Aleutian Islands and Annette Island. These regulations will do much to restrain the tendency of unrestrained commercialism to destroy the salmon fishery of future years. The territorial officials and legislators recognize the dangers of over-exploitation and are cooperating with the national government in safeguarding the sources of salmon wealth.

FUR-SEALS. Under the conservative legislation of Congress, and through the judicious and scientific administration of the U. S. Bureau of Fisheries, the fur-seals of the Pribilof Islands have steadily increased in numbers, and are now a valuable national asset. The closed season for the rookeries ended in the autumn of 1917 and the following year they were utilized for commercial purposes. The growth of the seal-herds is shown by the census, taken annually: 1915, 363,782; 1916, 417,281; 1917, 468,692; 1918, 496,432; and 1919, 524,269. This includes animals of all ages, but excludes those taken in these years for skins and for food for natives. The exploitation of the rookeries began in 1918, when 34,890 seals were taken. In that year there were two sales in St. Louis of dressed, dyed and machined fur-seal skins, when 8100 skins were sold for \$375,385, an average of \$46.34 per skin. In 1919 the number of seals taken was 25,381. Of these there were more than 6400 large males, who were in such large and disproportionate numbers as make such action advisable. It was the intention to take 35,000 seals, but the epidemic and consequent inability to obtain additional native labor made such action impossible. Under the international convention 15 per cent of seals taken go to Canada and an equal number to Japan. Authorization was granted to take as food for the

of ocean freight has been ensured during the open season through dockage suitable for large steamers, the landing piers being provided with modern methods of handling cargoes. Fuel for the railroad has been secured through the efforts of the Engineering Commission, under whom 55,390 tons of coal have been mined in the Matanuska valley. There yet remains an unfinished gap in the railroad of 138 miles, from mile-post 238 from Seward to mile-post 376. Of this section there were 38 miles of completed grade at the end of 1919, while location surveys had been made for the greater part of the remaining distance. This indicates that the road will be so far completed in 1920 as to permit its operation from Seward to the Tanana River, if not into Fairbanks itself. The railroad town of Anchorage has become the main centre of Federal activities in the interest of Alaska. Besides developing the Matanuska coal mines, the commission opens towns, sells lots, encourages farming, utilizes forestal resources, and is assisted by the Federal subsidiary establishments of the Geological Survey and of the Bureau of Mines. Climatic conditions are indicated by the fact that in 1919 the temperature did not fall below 32° until September 29, and the first snow fell October 3.

FEDERAL AND TERRITORIAL ROADS. Under the Alaska Road Commission there has been expended to date \$4,920,655, of which 41 per cent has been contributed by the Territory through the so-called Alaska fund. Since 1905 there have been constructed and maintained 1031 miles of wagon road, 673 miles of sled roads, and 3223 miles of trails. Approximately 400 miles of wagon road have a light gravel surface. Supplementary to the insufficient Federal road work, the Alaskan legislature of 1919, enacted a road law, and appropriated \$375,000 to be expended under cooperative agreement with Federal agencies. Previously the Territory has partly constructed and wholly maintained 241 miles of wagon roads and 232 miles of pack or sled trails. Considering the whole of Alaska good roads are even more important than the Federal railroad.

ALASKA FUND. This fund is derived from business and trade licenses levied by the Federal government. These amounted in the incorporated towns to \$68,229, a decrease of about \$13,000 from 1918. From sections outside of incorporated towns the amount—\$280,907—was \$12,255 less than the preceding year. The governor urges that this fund be covered into the territorial treasury for expenditure by the legislature. Territorial finances are mentioned under: *Legislation*.

PUBLIC LANDS. Land surveys are progressing, after years of entire neglect. During the year 18 townships were approved, 11 on the Seward meridian, and seven on the Fairbanks meridian. Surveys are in progress on the Cook Inlet coast of Kenai Peninsula, north of Kachemak Bay and in Chilkat valley. To date 134 townships have been surveyed; 82 on the Seward meridian, 39 on the Fairbanks meridian and 13 on the Copper River meridian. Reorganization of the service is recommended by the governor, who points out that every land claim has to be considered by four Federal executive departments.

FORESTS. Governor Riggs does not believe in national forests for Alaska as they discourage settlements, obstruct business and prevent the

development of forestal wealth by private enterprise. There are two national forests, Chugach, comprising 5,417,852 acres, and Tongass with an area of 15,449,717 acres. During 1918 the U. S. Forest Service by an extensive reconnaissance survey classified the agricultural lands suited for settlement as distinctive from the forestal. As a consequence the Chugach forest was reduced by 307,800 acres of agricultural land, which through presidential proclamation of Apr. 16, 1919, were restored to the public domain. The areas thus eliminated include a strip of land three miles deep from Kachemak Bay to Kasilof River, and also much of the survey land near Anchorage, the base of the governmental railroad. There were temporarily withdrawn from the public domain, for forestal purposes, 199,680 acres near Lituya Bay, by proclamations of May 2 and Aug. 16, 1919. The receipts of the Chugach and Tongass forests for the year 1919, aggregated \$102,813, while the total cost of administration was \$43,454. During the year there were cut 42,295,000 board feet of lumber in the Tongass and 6,360,990 feet in the Chugach. There was also cut for the Alaska Engineering Commission about 5,758,000 feet for free use in railroad construction. It is to be noted that the Sitka spruce cut from the Tongass for airplanes was found to be inferior to the spruce cut in the forests of Washington.

MAILS. The unsatisfactory mail service, put into operation in 1918, yet continues to the disadvantage of all Alaskan business and affairs, and is the cause of much discontent. Mail is still shipped to Alaska as express and freight; steamers have no mail clerks; return-mail facilities are denied business; and the unguarded parcels by freight are frequently robbed. Deploable conditions existed west of Seward, where for two months during the influenza epidemic Kodiak and Afognak Islands were cut off from communication and so deprived of medical aid. Fortunately the telegraph system built by the Signal Corps of the army has continued its work, which is viewed by the governor as invaluable. Supplementary lines of telegraph and telephone erected as the railroad is extended, and other governmental bureaus are gradually installing radio stations.

AIDS TO NAVIGATION. The difficulties and dangers of coastal navigation are slowly ameliorated through the persistent efforts of the Light House Service, which in 1919 established 19 new lights, 12 buoys and three beacons. On June 30th, such aids to navigation numbered 459, including 178 lights and eight gas buoys.

NATIONAL PARKS AND MONUMENTS. The Mt. McKinley Park, the Katmai and Old Kasaan Monuments remain uncared for and unimproved, while the Sitka Monument has received scant attention. As regards the Katmai Monument its survey, investigation and description are due to the energetic and patriotic action of the National Geographic Society. The results of the six expeditions of the Society to Katmai are noted below.

VOLCANOES. Although no eruptions of destructive violence have recently occurred in the volcanic regions of Alaska, yet conditions are such as to render study and investigations of the volcanic system of special interest. With this in view the National Geographic Society sent in 1919 its largest and most expensive expedition to the Katmai region. Headed by Prof.

Robert F. Griggs, of the Ohio University, the party spent the summer in thorough scientific investigations and in extended explorations. Volcanic activities of many kinds were discovered; among others numerous fumaroles so hot that their gases set fire to wood. In a previously unexplored arm of the Valley of Ten Thousand Smokes new craters were found and examined. The processes of revegetation in the ash-covered regions were studied as also the lavas, incrustations and gases, local examinations being supplemented by large collections for laboratory study later. An artist of extended field service secured 10,000 feet of motion picture films, in addition to a thousand photographs, colored and plain. It developed that the number of active vents had been underrated, being nearer a hundred thousand, it is reported, than to ten thousand. It is hoped that the investigations of Professor Griggs, when supplemented by analyses of the collected volcanic material, may throw definite light on the problem of Alaskan seismology, which covers the most extended field in the world. Geographically the expedition made important contributions. To the north of the volcanic valley was found a region of great natural beauty, filled with abundant game. There were explored and surveyed about 2200 square miles in unvisited territory, in which was found a lake of considerable size. A new route to the Valley of Ten Thousand Smokes was discovered, making it easily accessible. A hundred miles of unexplored coast line, previously incorrectly mapped, was charted, and a fine harbor discovered.

ALBANIA. A geographical district made up of the former Turkish provinces of Scutari and Janina, and parts of the vilayets Monastir and Kossovo, whose political status was still indeterminate in 1919. The estimated area of this region is between 10,500 and 11,500 square miles and the estimated population between 800,000 and 850,000 of whom about two-thirds were Moslems. The remaining one-third, Christians, were divided into Roman Catholics in the north and the Orthodox Greek in the south. The figures for the Christian population vary, but the number of Greek Orthodox has been placed at 140,000, and of the Roman Catholics at 120,000. From 1914 the provisional capital has been Durazza, with a population estimated at 5000. Chief cities with estimated populations: Scutari (32,000); Elbasan (13,000); Tirana (12,000); Argyrocastron (12,000); Berat (8500); Korytza (8000); Valona (6500).

HISTORY. The most important feature of Albanian conditions brought out by the Peace Conference was the fact that the country was hopelessly divided against itself as to its future determination. Petitions were submitted to the Peace Conference from Moslems, Murdites, and Koritzans, and from Albanians abroad, all of whom disagreed as to who should control, but agreed in their dissatisfaction with the frontiers established by the London Conference of 1913. During the year the American Red Cross did valuable work in the distribution of supplies and the care of the sick. At the close of the year it was reported that the people were beginning to return to work and to cultivate their lands. Food was said to be sufficient to prevent actual suffering but a shortage was reported in sugar, oils and other articles. See **WAR OF THE NATIONS**.

ALBERTA. A province of northwest Canada lying east of British Columbia, west of Saskatchewan, and north of the United States, with an area of 255,285 square miles and a population in 1911 of 374,663, and in 1916 of 496,525, of whom 277,256 were males and 219,269 females, and of whom the rural population numbered 307,776 and the urban 188,749. Chief cities in 1916: Calgary, (56,514), and Edmonton, (53,846). Edmonton is the capital.

The constitution was established by the Alberta Act of 1905. The executive is nominally the lieutenant-governor, appointed by the Federal government, but actually the Executive Council or Cabinet of the legislature. Legislative power is vested in the Assembly, elected by universal suffrage, women having the right to vote. The lieutenant-governor at the beginning of 1919 was the Hon. R. E. Brett, and the Prime Minister, Hon. C. W. Stewart.

ALCOCK, Sir JOHN. British aviator, died in France, December 19. His death was the result of an accident when he was trying to alight on the Seine in a waterplane. During the war he fought in the Saloniki campaign and received the Distinguished Service Cross. He was an expert mechanician as well as thoroughly conversant with the principles and practice of aviation and he gave instruction in the art of flying to many thousands. In June, 1919, along with Arthur Whitman Brown he achieved the great feat of flying in an aëroplane from Newfoundland to the Irish coast without stopping. He left St. Johns, Newfoundland, in the afternoon and alighted near Clifden, Ireland, on the following morning at about 10 o'clock. This exploit was at the time without a parallel and Alcock and Brown became the heroes of the hour, the former being honored with knighthood. See **AERONAUTICS**.

ALCOHOL. See **CHEMISTRY, INDUSTRIAL; LIQUORS**.

ALCOHOL AND MEDICAL PRACTICE. Considerable confusion seems to have arisen because of the statements by high medical authority that alcohol is no longer necessary in medical practice. This statement has been distorted to mean that alcohol has no medicinal value, which is quite a different proposition. Alcohol became displaced by the introduction of the hypodermic use of cardiac stimulants to tide the patient over dangerous ground in septic and toxic blood states. At present strychnine, digitalis and its active principles, strophanthus and its active principles, caffeine, camphor, adrenaline, nitroglycerine and numerous other drugs are all more or less used for this purpose. It has long been a law in drug therapeutics that the superior remedy economically will displace one which is less efficient, but it is also true that if the new remedy becomes scarce or disappears from the market, the older one comes back into use. This was realized during the late war, when the disappearance of numerous popular imported synthetic drugs made it imperative to return to the native remedies formerly in vogue. While there is no possibility that the cardiac stimulants above-mentioned will ever give out, it must be borne in mind that their use has certain limitations, as seen in great epidemics like influenza, where thousands of individuals are dangerously stricken at once. Most of the stimulants above-mentioned are powerful and the dose cannot be

repeated indefinitely, so that a high degree of personal supervision by physicians and trained nurses is required. Moreover there is no recognized standard of procedure in these cases, but each stimulant has its own indications and it requires a high degree of medical skill to determine the proper one to give in given circumstances. Hence it is not surprising that when a high army physician or civil health officer or hospital head has hundreds of alarming cases under his control at once, he must feel the need of a stimulant which can be given in a standard fashion, which requires no high degree of technical skill to administer it and which is not too dangerous to be repeated when necessary at short intervals. It is not absolutely claimed that alcohol is such a remedy but if it is not, then we have no remedy to meet these conditions. In ordinary winter gripe which begins with settled winter weather, to disappear in the spring, there is no real menace to the community. It is rather the individual who is menaced and the aged and debilitated one at that. Health officers have as a rule advised against alcohol for winter gripe. The patients are not as a rule in a condition so serious as to require heart stimulants and seek alcohol only to antagonize the extreme discomforts of the affection; so that very wisely the authorities discouraged the practice of self-medication with whiskey. The contrast between conditions here and in the pandemic should be sufficiently obvious. The Volstead enforcement bill allowed the sick man to obtain whiskey on a physician's prescriptions, but since the druggists would not take out liquor licences, there was no one to fill them. This attitude of the druggists was based on the dislike to bond themselves and to run the risk of penalties for purely technical offences, such as failure to make reports on time. The government toward the close of the year gave permission to certain distillers to make whiskey for medicinal use and it was understood that dispensaries would be forthcoming when needed, the present period being virtually an interregnum. No one knew whether or not medical men would take out permits to prescribe liquors, but experience with the narcotic laws seemed likely to deter many of them from such a course. The maximum guaranteed an invalid appeared to be three pints a month, prescribed at the rate of a pint every 10 days (if the prescription is rewritten). It was evident that many details must be threshed out by the courts and that no one could possibly foretell the status of alcohol in medical practice.

ALDEN, HENRY MILLS. American editor and author, died October 7 in New York City. He had been editor of *Harper's Monthly* since 1869, though he retired from active work some years ago. He was born near Danby, Vt., Nov. 11, 1836, and was a descendant of John Alden, worked in a cotton mill at the age of 14, but found time to attend school and prepare himself for college; entered Williams College in 1853 and supporting himself by teaching and other outside work, graduated in 1857. Among his fellow students were James A. Garfield, Horace E. Scudder, John J. Ingalls, and Washington Gladden; and the president at the time was Mark Hopkins. He graduated at Andover Theological Seminary in 1860, but did not take orders. He made his literary debut with some articles published in the *Atlantic Monthly* and

in 1861 he went to New York where he supported himself by lecturing in a girls' school and by writing articles for the newspapers. He entered the house of Harper and Brothers in 1862 and was manager of the *Harper's Magazine* from 1863 to 1869, when he became its editor. He was lecturer at the Lowell Institute 1863-64. He contributed for many years to the department of the magazine known as the "Editor's Study," and he wrote three books, namely: *God in His World*, (1890); *A Study of Death* (1895); and *Magazine Writing and the New Literature* (1908).

ALFALFA. The alfalfa crop in the United States in 1919 was roughly estimated as one-seventh of the total hay crop of over 108,000,000 tons. While the crop is now grown in every State, the principal production is in the western half of the country. Alfalfa is the chief hay crop in Arizona and Utah, where it constitutes about 65 per cent of the hay produced while in other western States the following percentages of the hay are alfalfa: Wyoming 60 per cent, Colorado 57 per cent, Nevada 55 per cent, Idaho 49 per cent, New Mexico 47 per cent, Montana 43 per cent, Kansas 42 per cent, California 39 per cent, Oklahoma 37 per cent and Nebraska 34 per cent. The average price of alfalfa hay to growers on the 15th of each month ranged from \$20.15 per ton on July 15th to \$23.32 on May 15th.

The alfalfa seed crop was reported as about normal although in some important seed-producing sections and especially in Kansas which normally is one of the main seed-producing States the crop was light. The stocks of seed in June, 1919, were reported as much lower than those of the preceding year largely as the result of a heavy spring demand. The seed sales for the year ending June 30, 1919, were estimated at 53,000,000 pounds, the exports at 316,425 pounds and the imports at 770,400 pounds. For the year ending June 30, 1917, the exports and imports were approximately 3,000,000 pounds each. The seed crop of 1919 passed from the grower to the dealer at a comparatively early date and at good prices. The larger portion of the crop was sold from \$12 to \$15 per bushel. Later in the fall even higher prices were secured and seed of Grimm alfalfa in certain sections ranged in price from \$24 to \$27 per bushel.

The hairy leaved Peruvian alfalfa is reported as gaining in popularity in the Southwest on account of its greater hardiness and yielding capacity as compared with the common variety. The results of experiments at the Missouri Agricultural Experiment Station in progress from 1910 to 1917 showed that the average cost of a ton of alfalfa hay loose and in the stack on the farm was \$9.34. The cost of production per acre was \$19.80. The crop paid the farmer for each ten hours of labor \$4.92.

ALGERIA. A French province in northern Africa comprising two great divisions; northern and southern Algeria, which in turn are divided into departments and territories as follows: northern Algeria into the departments Algiers, Oran, and Constantine, and southern Algeria into the territories of Ain Sefra, Touggout, Ghardaia, and the Saharan Oases. The laws for the provinces are passed by the French Chambers and arrangements not falling within the sphere of legislation are determined by decree of the presi-

dent. The administration whose centre is at Algiers is under a governor-general, assisted by a consultative council. Area including the new territories in the south, about 343,500 square miles: population 1911: northern Algeria, 5,069,522, and southern Algeria 494,306. The native population numbered 4,740,526 and the European 752,043. The chief towns with the population figures for 1912 were: Algiers, 172,397; Oran, 123,086; Constantine, 65,173 (these three being respectively the capitals of the provinces of the same names); Bône, (42,039); Sidibel-Abbes, (30,942); Tlemcen (39,874); and Blida (35,461). There is a university at Algiers (875 students in 1918). In 1917-18 there were 1305 primary schools with 3915 teachers and 146,508 pupils. The greater part of the country is unsuited for agricultural purposes, but in the neighborhood of the coast there is a limited area of highly fertile lands which are scientifically cultivated, and for the most part owned by Europeans. There are various systems of land tenure including proprietorship and the *métayer* system. The chief products are wheat, barley, oats, and other cereals, wine, oil, vegetables, tobacco, fruit, live stock, iron, lead, zinc, and other minerals. Considerable progress was made in the development of coal and lignite production during the war, owing to the increased demand for coal and other fuel. Phosphates in workable quantities have been discovered.

The yield of wine in 1918 was 137,129,718 gallons. The fisheries of Algeria are important and include sardines, allaches, anchovies, sprats, and tunny fish. In 1917 there were 3480 persons engaged in fishing.

FINANCE. The following table gives details of the 1918 budget:

Revenue		Expenditure	
	Francs		Francs
Taxes (direct)	19,676,864	Administration debt	42,341,477
Taxes (indirect)	62,215,952	Interior	31,441,295
State domain	12,486,645	Native affairs	8,323,627
Monopolies, etc.	12,918,819	Finance	12,672,253
Various	2,322,916	Posts and telegraphs	16,765,865
Receipts d'ordre	31,962,725	Public works	21,770,158
Extraordinary	17,050,000	Agriculture, etc.	4,191,462
Special revenues	1,226,000	Various	5,301,848
		Extraordinary	17,050,000
Total	159,859,921 (6,394,396£)	Total	159,857,985 (6,374,316£)

The budget estimates for 1919 were: Revenues, £8,277,952; and expenditures, £8,268,364. The revenue for the Southern Territories in 1918 was placed at 5,483,466 francs and the expenditure at 5,471,807 francs; and for 1919 the expenditure was given at 7,151,313 francs. The Bank of Algeria with a capital of 20,000,000 francs under a charter extending to the end of 1920 may issue notes, which, however, must not exceed 1,000,000,000 francs according to the law of Oct. 19, 1918.

COMMUNICATIONS. Vessels entered in French and foreign trade in 1917 numbered 1906 with a tonnage of 1,962,833. The merchant marine in January, 1918, comprised 1322 vessels of 17,486 tons. In 1917, 2112 miles of railway were open for traffic and of these 807 were privately owned. Post offices in 1917 numbered 712 and the telegraph comprised 9161 miles of line and 25,147 miles of wire.

GOVERNMENT. Executive power is vested in a

governor-general who has charge of all services except the non-Moslem services of the Treasury, Justice, Public Instruction and Worship. He prepares the budget, which is distinct from that of France, and is voted by the Financial Delegations and the Superior Council. The delegations represent respectively the French colonists, the French taxpayers who are not colonists, and the native Moslems; and the Superior Council consists of elected members and the higher officials. There is also an advisory government council that assists the governor-general. Legislative power is vested in the French Parliament, to which each department sends one senator and two deputies. Governor-general at the beginning of 1919, M. Jonnart, appointed, Jan. 20, 1918.

ALIEN PROPERTY CUSTODIAN. See INSURANCE.

ALLEGHENY COLLEGE. An institution of learning, non-sectarian in policy but under the control of the Methodist Episcopal Church, founded in 1815, at Meadville, Pa. The enrollment for 1919 was 324 men and 194 women. The faculty numbered 31, three additions during 1919. Productive funds amounted to \$846,707, and the income for 1919 was \$185,649. The library contained 34,000 bound and 12,000 unbound volumes. In 1919 a new gymnasium and an addition to the women's dormitory were built at a cost of \$150,000. President, William H. Crawford, LL.D., D.D.

ALLIANCE FRANCAISE, FÉDÉRATION DE L'. An association of clubs, societies, and groups formed for the purpose of encouraging and furthering in the United States and Canada the study and cultivation of the language, literature, art, and history of France. It was organized in 1902 and consists of nearly 200

local branches distributed throughout the territory of the United States and Canada. In 1919, new groups were established in Duluth, Minn., Evansville, Ind., Moline, Ill., Rock Island, Ill., Davenport, Iowa, Princeton, N. J., Spokane, Wash., and at the University of Syracuse, Syracuse, N. Y. An important function of the Federation is to engage lecturers who make tours throughout the country. The official lecturers of the Federation for the year 1919 were Mr. André Fribourg, a writer of note, and Mr. André Allix whose articles on physical and economic geography have attracted wide attention. The organization maintains a circulating library. Among the officers of the Federation may be mentioned the following: Honorary President, Mr. J. J. Jusserand, French Ambassador at Washington; President of the Administrative Council, Mr. J. LeRoy White; Vice-President, (Eastern States) Mr. Alexander T. Mason; General Secretary, *pro tem*, Mr. Felix Weill. Head-

quarters are maintained at 200 Fifth Ave., New York City. In 1919 the general annual meeting was held in New York on April 5th.

ALSACE-LORRAINE. A territory restored to France after the end of the War of the Nations in 1918. From 1871 when it was taken by Germany it constituted an imperial territory which was divided into three districts: Lorraine, Upper Alsace, and Lower Alsace, and governed by a Statthalter appointed and recalled by the emperor, with his seat of government at Strassburg. Laws were made by the emperor with the consent of the Diet which consisted of two Chambers, the first comprising members who were nominated and the second 60 members elected on general direct suffrage. (For events following the armistice, see below.) The area is 5605 square miles with a population in 1910 of 1,874,014, of whom those who spoke German numbered 1,634,260, and French 204,262. No figures of production, population, etc., were available during the war. The distribution of the population by religion according to the census of 1910 was: Catholics, 1,428,343; Protestants, 408,274; Jews, 30,483. For higher education there was the university of Strassburg, and in 1913 18 gymnasia and other institutions for secondary education with 2841 elementary schools and 69 private elementary schools. The acreage under wheat in 1913 was given at 342,695; under rye, 138,632; under potatoes, 226,700 under oats, 282,165; under hay, 485,755; under barley, 122,727. The vineyards in 1917 had an acreage of 62,122 with a yield of 2,672,318 gallons. The cotton manufacture was very extensive. Mineral products in 1913 were placed at 21,136,265 metric tons of iron ore; 3,795,932 tons of coal; 76,672 tons of salt. The persons employed in the mines and quarries in 1913 numbered 38,509. The large cities with their population in 1910 were: Strassburg, 178,891; Mülhausen, 105,488; and Metz, 79,318. It was announced in 1918 that the French were making progress in introducing the French system of education.

RAILWAYS. According to a decree issued by the commissary-general of the French Republic at Strassburg the railway system of Alsace-Lorraine was to have a new organization and was to be operated by an administrative body with headquarters at Strassburg, under the authority of the commissary-general. The administrative body was to consist of a *directeur*, or manager, and a council of 21 members, including representatives of Chambers of Commerce in industrial and agricultural associations in the territories traversed by the railways. M. Lebert, assistant operating manager of the state railways, was appointed *directeur*, and the other principal officers were selected from among high officers on the Est, P.L.M., Orleans and State railways. From 1871 until the end of the war the railways of Alsace-Lorraine were the only "imperial" railways in the German Empire, the other State railways being owned by the individual states forming component parts of the Empire. The system in Alsace-Lorraine consists in part of lines originally built and owned by the Est railway and ceded to the German Empire under the terms of the Treaty of Versailles and restored to France after the war, and in part of extensions built by Germany since 1871. Germany regarded the Alsace-Lorraine railways chiefly from the standpoint of strategical

lines, without however overlooking their commercial value. Tracks, stations and sidings were laid out and loading and unloading accommodations were provided in accordance with actual and possible military requirements.

GOVERNMENT. By decree of Nov. 26, 1918, the French government took over the administration of the territories until peace should be signed, French troops meanwhile having occupied the country. French officers were placed in charge of affairs and on Mar. 22, 1919, M. Alexandre Millerand was appointed governor-general.

TRANSITION. As was natural there was some friction in passing from the German régime to that of the French. Early in the year criticism of the French administration took on a sharp tone in the press of the former German Reichsland. An Alsatian writer, for example, warned the French administration not to imagine that it would inherit all the affection that the Alsations had cherished for France under the German persecution. There was complaint of the delays on the part of the French government in dealing with the matters submitted to the functionaries of the administration. The people were resigned, they said, to the inevitable lack of employment and to the scarcity of provisions, but they could not understand the failure of the central authorities of Paris to deal with the most pressing problems or their frequent reversals of policy. They complained of the inconsistent rulings of the different bureaus. In this they did not charge against the French any lack of sincerity, but they did accuse the government of a certain inefficiency. They said that while they loved France and hated the Germans, they retained a certain admiration for the German talent of organization. They recognized the German qualities of order and discipline. After all, they said the Germans had brought great prosperity to the country. There had been an extraordinary development in Alsace under German rule, and the scale of living had become luxurious. Taste was lacking to be sure, but comfort and prosperity were widespread. Huge buildings, ugly but commodious, had sprung up everywhere in the large cities. The German régime had been one of the great expenditure and of a spirit of confidence. They discounted the future and undertook extensive public works. Moreover, the Alsations attained a wide liberty in legislation, and had adapted to modern requirements the French codes. To change all this would result in disorder and discontent. A French writer, M. Charles Bonenfant, expressed the situation as follows: "We were here in a house with an elevator, bath rooms, central heating, modern comfort, but where no one could sleep because it was infested by vermin. We have driven out the vermin, let us keep the comfort." With the stroke of a pen the French had abolished the German magistracies which of course was necessary for it was impossible to allow the people to be judged by Germans. Court-martials applied the law under the Code Napoleon, and acquitted themselves fairly well, but the whole country found itself suddenly deprived of civil justice. Much confusion resulted and a vast amount of local business was delayed. The new administration, however, soon attached to it a large number of Alsatian lawyers. The Superior Court took its oath on February 3d. Nevertheless there was a lack of men for the important positions, and the func-

tionaries were overworked. The nominations of officials were slow, and the service suffered. The provisional government with its twenty secretaries, although capable, had too much to do. The courts of the region were supplied by French functionaries, some of whom did not know German, and by Alsatian judges who knew the German law and applied it in the French language. From this arrangement it seemed probable that harmony would result in the long run. The officials in Alsace that corresponded to the French justices of the peace had been suspended along with others and this gap had not been filled during the early part of the year. In all matters it was necessary to await the word from Paris for example in regard to questions of transport, indemnities, mails, railways, orders and deliveries of goods, etc. The post office which was admirably efficient before the war, but went to pieces during the war, was still practically inoperative. Letters took nine days to reach Switzerland. In the beginning of the year it was reported that the railways were going fairly well, but that the situation was still difficult. The French were obliged to keep the employees of the German railways, and these men knowing that they were bound to be discharged had no motive for efficiency. Various embarrassments resulted from placing Frenchmen who could not speak German in charge of the stations, and from other changes. The question of teachers was a difficult one. The Alsatian teachers had been formerly in German normal schools, and therefore were regarded with suspicion. The Germans had left nothing undone that could bestow upon them a German mentality and so combat the influence of the priests who remained French. It was said moreover that about 80 per cent did not understand French and did not know anything about French literature or history. All that they knew about France and her people had been derived from hostile sources in the German normal schools. The question was how to replace them until they were assimilated to the French civilization. Eventually they ought to be sent to France, but for the present it was necessary not only to retain them, but to keep along with them some German teachers. In the main the system worked fairly well, but was embarrassed by interference from Paris. For example, the Reichstag during the war voted the sum of 250,000,000 marks to supply the most pressing personal needs of those who had suffered damage from the war, and 50,000,000 of this sum was appropriated to Alsace. Thirty million had been expended in advance and there now remained on deposit 20,000,000 marks. These were found by the French, and the question arose what should be done about them. To expedite matters they applied the German law and distributed the fund for the relief of the inhabitants, but straightway came a dispatch from Paris saying: Apply the French law to damages, but there was no French law and it was necessary therefore to suspend the payments. The unfortunate persons fell back again into their poverty, and those who had loaned money to them on the promise of relief from the government withdrew their loans and even furniture which had been temporarily supplied. Long and complicated proceedings followed while the cases of destitution remained without relief. The above account, published by M. Charles Bonnefont in March, is given in some

detail because it was a fair example of the criticisms on the part of the Alsatians and Lorrainers throughout the year.

THE CURRENCY QUESTION. Great difficulty and much irritation with the French government resulted from the change in currency after the occupation. Under German rule the mark had of course been the monetary unit. Its value during the latter part of the war and after the defeat had sunk to an extremely low point in foreign markets. Alsace-Lorraine no longer was in the economic sphere of Germany, and obviously should be relieved of German currency, which had hardly any value in the French market and the markets of the Allies, which alone were opened to her. The French government accordingly took a step which appeared extraordinarily generous. A decree was issued on Nov. 26, 1918, depriving of legal tender quality all German currency, including bills of the Imperial Bank, the German states, etc. The inhabitants were assured that French money would be exchanged for German, and to show that the measure taken against the mark was simply political and not financial, the decree of November 26 stipulated that German bills should be exchanged at the rate of one franc, 25 centimes per mark. This delighted and surprised the population, for it took no account of the real value and relation of the mark to the franc, even before or during the war. The French treasury was buying the mark at a higher rate than it had sustained in the most prosperous times. Immediately German bank bills flowed in from all parts, and were exchanged at the rate of 100 to 125. This situation, however, did not last long. When it came to bank accounts, credits, coupons, etc., they supposed that the same rule would apply, but soon found out that it did not. When a depositor claimed from the bank 125 francs for the 100 marks that he had deposited, the banker logically replied that having received marks, he was under obligation only to return marks, and that obviously he could not make a payment at this rate until he himself had exchanged his own marks for francs at the same rate. It was then seen that the results of the application of this principle would be extremely complex, and that the policy had been ill-considered and rash. The decree had been issued without consulting bankers or merchants and without reference to actual conditions. There had been an undue confidence in the ability of Germany to pay, and this confidence was not shared by the Allies of France. Indeed the phrase, "Germany will pay," had become so frequent as to cause ridicule in France itself. The main point before the government was how to extricate itself from this difficulty without forfeiting the confidence of the Alsatians and Lorrainers. It was argued by them that they were entitled to a fair treatment in the circumstances. The government, however, was dilatory in the matter and its attitude was far from satisfactory. A long time was wasted in disputes among the persons concerned in the issuing of the decree, in regard to which of them was to blame, and the subject was discussed in the reports presented to the Chamber of Deputies in February and April, in the course of which it was said that blunders of a serious nature had been made. The Minister of Finance had submitted to the signature of the President of the Council a decree which was not legal.

The under Secretary of State to the President of the Council had let it pass, and the President of the Council had not been informed upon the matter, and signed a decree which he did not know to be illegal. Commissions were appointed, and finally the decree was recalled and a new law voted. Provision in regard to the exchange did not apply to credits, deposits, etc. For example, an Alsatian who at the time of the armistice had paid to his bank a hundred marks for from 60 to 70 francs, might collect 125 francs, but another who before the war had left his deposits in the bank when the rate was 122 or 123 francs per 100 marks, could now collect only from 40 to 50 francs. Complaining of these and other inconsistencies and injustices, the inhabitants and their representatives made frequent efforts to have the matter righted. M. Millerand, who had meanwhile been appointed Commissioner-General of Strassburg, pointed out the gravity of the situation, and the necessity of carrying out the arrangement promised by the decree of November. These efforts, however, had had no result. The public was naturally exasperated, and among all classes the French government was sharply criticized. The labor unions in the country were greatly embarrassed. They possessed funds which could not be applied to the relief of members out of employment, because the treasury of the union obviously could not pay five francs in place of four marks until after having made the exchange of its funds at that rate. The Minister of Finance on Apr. 9, 1919, recognized these difficulties and said that unless the decree signed by the Minister of War was in force, the regained provinces would suffer the greatest hardship. The same difficulty occurred among the agricultural societies, insurance companies, industrial establishments, commercial houses, etc. The situation of the Alsace-Lorraine Crédit Foncier was still more embarrassing. For 45 years Germans had done their best to Germanize the Alsatians. They had constructed many buildings and made many loans on mortgages. The securities of the Crédit Foncier were much in demand, because it was eminently a French institution, and securities of the company were widely held, even among the poor. The French government now required the payment of 12 francs, 50 centimes, for 10 marks, and the reimbursement for 625 francs of obligations which had cost 500 marks. This was a logical consequence of the decree, but it meant that the marks paid by the German debtors in carrying out their contracts should also be regained at the same rate, otherwise the company would fail. All the local banks that had succeeded in surviving the German occupation were in the same situation. It seemed an especial hardship, for since they had for so many years maintained the interests of France in the country, their return to France now would threaten the ruin of their stock holders. A meeting of stockholders of a large local bank at Strassburg had unanimously voted a resolution declaring that the capital and resources of their company, created in the course of years of labor, were jeopardized by the new legislation in regard to the mark, and expressed the wish that the government would keep the promise which its representatives had solemnly made of saving the financial establishments from the loss of their means of action, and of protecting stock holders

from loss of their capital and holdings. A suggestion from the Alsatian point of view of the right settlement was as follows: Every Alsatian or Lorrainer owing a debt in marks to which this rate of exchange was applied should find as offset a purchaser in the French treasury of his assets at the same rate. The treasury would thus find itself in possession of a considerable holding in marks. Thus having possession of several billions of marks, it could bring a strong economic pressure to bear upon Germany, and that was really desirable.

LORRAINE. In Lorraine there was the same degree of discontent with the French government as in Alsace, though conditions were not identical. Their loyalty to France was incontestable, but their disappointment was the greater on that account. For a long time a spirit of dissatisfaction had spread among the people, but the newspapers did not give expression to it for there was a general feeling that the grievances might be redressed in time, and that patience during the period of transition was the duty of all. But eventually the discontent became public. A revolutionary agitation began to show itself. Strikes succeeded one another rapidly and on unreasonable grounds. Leaders of Bolsheviks had worked their way into the unions and their programme appeared to be not only anti-French, but anti-social. There seemed to be no adequate protection afforded by the government. Latterly there had been some show of energy. The Governor-General, M. Millerand, was undeniably energetic and able. He visited Metz and investigated the grievances and as a result two German agents were suppressed. The disturbances in Lorraine were attributed in the press to German influence. All disorders in Alsace-Lorraine were plainly to Germany's interest. For a considerable time after the armistice German newspapers continued to be popular in Lorraine, and at Metz alone there were several of them. In fact their number was greater even than under the German rule. Toward the end of the year, however, one of the most important of these newspapers was suspended and its editor arrested. It was at that time pointed out that the Germans who remained in Lorraine were beginning to assume an aggressive attitude, were continuing to speak their own language, and to demand that the natives reply in the same, and were associating themselves with the worst revolutionists, holding meetings, and addressing people in German with a view to inciting them to revolt. For a short time after the armistice, during the enthusiasm of the French victory, the Germans kept in the background. They soon began to show their heads, however, and gradually summed up courage to praise openly the results of the German revolution. Among the conservative classes of Lorraine the question was raised whether the German spirit was to continue in their country under the guise of trade union tyranny. In general the peace-loving and orderly element complained that the effects of victory were countervailed, and that the French government was so lax that the country was a prey to disorder. See **TRADE UNIONS.**

ALUMINUM AND BAUKITE. The domestic production of bauxite, the raw material from which aluminum is obtained, was 569,000 long tons in 1918, as compared with 588,690 long tons for 1917 and 425,100 long tons for 1916.

The total value of the product was \$3,244,000 in 1918, \$3,119,058 in 1917 and \$2,296,400 in 1916. In 1918 Arkansas produced 523,000 tons of the total of a value of \$2,962,000 while the remaining 37,000 tons, valued at \$282,000, came from Georgia, Alabama and Tennessee. Imports of bauxite fell from 7691 long tons in 1917 to 3653 tons in 1918 and the value decreased from \$28,989 to \$14,791. Exports, including bauxite concentrates amounted to only 19,711 tons in 1918 valued at \$1,523,688 as against 21,791 tons in 1917 of a value of \$1,323,926. The United States led the world in the production of bauxite in 1917, the figure of 568,690 tons being greatly in excess of that of the United Kingdom, Italy or India. No statistics for France were available. The value of the primary aluminum produced in the United States in 1918 was \$41,159,000, a decrease from \$45,882,000 in 1917. The value of secondary aluminum produced in 1917 was \$16,711,800. Imports of crude and semi-crude aluminum in 1918 totaled 1,690,683 pounds valued at \$533,156 and manufactures of aluminum amounted to 20,882 pounds, giving a total value of \$554,038. Exports of aluminum included 24,135,234 pounds of crude and semi-crude and 1,890,073 pounds of manufactures the total value being \$10,869,388. See CHEMISTRY, INDUSTRIAL.

AMBER. See MINERALOGY.

AMERICAN ASSOCIATIONS AND SOCIETIES. For organizations whose official titles begin with the word American, see under the important descriptive word of the title.

AMHERST COLLEGE. Founded at Amherst, Mass., in 1821. Students in the fall of 1919 numbered 503, the largest enrollment since 1916. There were 52 members of the faculty, including two teachers from England, R. H. Tawney of Oxford in the department of Economics, and Ernest Barker in that of History. The library contains 120,000 volumes. Productive funds for the year amounted to \$3,800,000; the income was \$300,000. President, Alexander Meiklejohn, Ph.D., LL.D.

AMERICAN FARM BUREAU FEDERATION. See AGRICULTURAL EXTENSION WORK.

AMERICAN GRAND OPERA ASSOCIATION. See MUSIC, Opera.

ANALYTICAL CHEMISTRY. See CHEMISTRY, GENERAL PROGRESS OF.

ANATOLIA or ASIA MINOR. That part of Turkey which consists of a peninsula at the western extremity of Asia with the Black Sea on the north and east, and the Mediterranean on the south, having an area variously estimated at from 196,000 to 199,272 square miles and a population at from 9,000,000 to 10,186,900. with a density of 52 per square mile. The component parts or vilayets with their estimated area and population are as follows: Brussa, area 25,400 square miles, pop., 1,626,800; Smyrna (Aidin), area, 25,801, population, 2,500,000; Konia, area, 30,410, population, 1,069,000; Angora, area, 27,370, population, 932,800; Adana, area, 15,400, population, 422,400; Sivas, area, 23,970, population, 1,057,500; Trebizond, area, 16,671, population, 1,265,000; and Kastamuni, area, 19,570, population, 961,200; and there are also the two sanjaks of Ismid (area, 3130, population, 22,700), and Bigha (area, 2550, population, 129,500). See WAR OF THE NATIONS, and TURKEY.

ANDREĖEV, or ANDREYEV, LEONID NIKOLAEVITCH. Celebrated Russian writer of the new school, died September 12. He was born at Orel in 1871, and after studying law at the universities of Moscow and Saint Petersburg, and practising for a short time, he became a police court reporter on one of the Moscow newspapers. His writings had little success until Gorki discovered him, and his early life was so full of hardship that at one time he attempted suicide. His short stories, written in rapid succession, attracted attention by their singular quality, and after the publication of his first collection in 1901, he was regarded as a new star in Russian literature. This collection in a short time sold 250,000 copies. He continued to write short stories throughout his life, and never succeeded in achieving a real novel. He has been placed by readers outside of Russia in the same class with Maxime Gorki, whom, however, he did not equal or even approach in respect to form. He was eccentric, mystical, and apparently unable to create real characters, though possessed of unusual analytical power and a brilliant style. His works seem to be animated by a spirit of fatalism, and they abound in tragic circumstances. After the revolution, unlike Gorki, he was bitterly opposed to the Bolsheviks and just before his death had addressed an appeal to humanity against their savage conduct, saying that Russia was not in revolution, but in a state of chaos. His writings include the following: *The Wall* (1901), describing the vain efforts of a colony of lepers to break through the wall which surrounds them; *The Red Laughter* (1905), a narrative of the Russo-Japanese War; *The Burglar* (*Current Literature*, May, 1905); *His Excellency the Governor* (*Harper's Weekly*, Feb. 9 to March 2, 1907), the story of an official who betrays the people and is the victim of revolutionary vengeance; *To The Stars* (*Poet Lore*, 1907), a poetic drama; *Sava* (1906), the story of an anarchist; *Darkness* (1907); *King Hunger* (1908); *Lazarus* (*Current Literature*, May, 1907), a bold version of the Bible story; *The Life of Man* (*Oxford and Cambridge Review*, 1908), a mystery play; *The Seven Who Were Hanged* (1909), dealing with capital punishment; *Judas Iscariot and the Others* (1910); *A Dilemma* (1910); *Anathema* (1910), a tragedy in seven scenes; *Silence and Other Stories* (1910), tales of horror; *Life is so Beautiful to the Resurrected* (*Current Literature*, September, 1910); *The Ocean*, a tragic tale characterized by a Russian critic as a "hymn to chaos"; *Love of One's Neighbor* (*The Glebe*, January, 1914), a satire; and *The Sorrows of Belgium* (1914), which praises the self-sacrifice under the German invasion.

ANGELES, FELIPE. A Mexican general in revolt against the Carranza government, was executed at Chihuahua city on November 26th. (See MEXICO, paragraphs on History.) He was one of the most distinguished of Mexican generals under the Diaz and Madero régimes, and was known in the United States and elsewhere for his cultivation and enthusiasm for democratic ideals as well as for his ability as a military officer. He was born in the state of Hidalgo, June 30, 1869, of a mixed Creole and Indian family, the son of an officer who had served against Maximilian. He studied at two of the leading French artillery schools and he wrote a military text-book as the result of his work

and observations in France. He was also a graduate of the military school of Chapultepec in Mexico. He was closely attached to Madero who entrusted him with important operations against the rebels under Zapata, which he conducted with marked success. Under Huerta he was for a time kept in prison as he refused to support the new government and take a commission in the Huerta army, but though Huerta killed many of the supporters of Madero, he spared from motives of policy the life of Angeles, who was released on condition that he should go to France. On his return from France he joined the armies of Carranza and Villa, and when the two generals separated he stood by Villa whose chief of staff he became. He was one of Villa's most successful generals and was especially remarkable for his humane spirit and regard for the laws of war. He was highly accomplished and widely traveled. He always expressed admiration for the institutions of the United States.

ANGLICAN CHURCH. See ENGLAND, CHURCH OF.

ANGOLA (or PORTUGUESE WEST AFRICA). A Portuguese colony on the West African coast with a coast line of about 1000 miles, and bounded by French Congo, Belgian Congo, British South Africa, and the former German colony of Southwest Africa. Its boundaries were fixed by the conventions of 1886 and 1891. Estimated area, 484,800 to 490,000 square miles, and estimated population, 4,120,000; capital, Saint Paul de Loanda. Other important towns are Cabinda, Ambriz, Novo Redondo, Benguella, Port Alexander, and Mossamedes. The native population in 1914 was estimated at 2,124,361. The military forces were not large, varying from some 2700 men to 4731, the majority being natives. The trade is chiefly with Portugal and consists for the most part of textile products (the leading import), coffee, rubber, and dried fish. Railway open for traffic, 818 miles. In July, 1918, the Trans-African Railway was purchased by the government. The colony is connected by cable with the telegraph systems of East, West, and South Africa. Angola has been a Portuguese possession since 1575 with a brief interval from 1641 to 1648 when it was in the hands of the Dutch. It is under a governor-general whose seat is at Saint Paul de Loanda, and for administrative purposes it is divided into nine districts.

ANHALT. Before the war a duchy of the German empire, surrounded by the Prussian provinces of Brandenburg and Saxony with an area of 888 square miles and a population in 1910 of 311,128. Capital, Dessau, (56,605); other cities, Bernburg (33,724; Cöthen (23,416); and Zerbst (19,210). The population is mostly Protestant, the Catholics in 1910 numbering only 12,755 and the Jews 1383. The estimated income and expenditure, 1918-19 was £1,056,950, and the public debt on June 30, 1917, was £470,991. Before the war the executive power was vested in a duke, and the legislative in a Diet of 36 members of whom two were appointed by the duke, eight represented the land-owners who paid the highest taxes, two were the highest taxed members of the industrial or mercantile class, and fourteen were representatives of other inhabitants of towns and 10 of country districts. The duke governed through a minister of state. In 1918 the reigning duke was Eduard, son of

the late Duke Frederick of Anhalt, who succeeded his brother on April 21, 1918. During the revolution Anhalt declared itself a republic and led the way in voting for the Constituent Assembly in the new German Republic.

ANIMAL INDUSTRY. See LIVE STOCK and VETERINARY MEDICINE.

ANNAM. A French protectorate forming part of French Indo China (q.v.); was acquired by France under the treaty of 1884. Its area is about 52,100 square miles with a population in 1914 of 5,200,000, including 2117 Europeans. Capital, Hué (60,711); largest town Binh-Dinh (74,400). In the towns along the coast the population is Annamite, and in the hilly tracts it consists of Moï tribes. Agriculture is carried on chiefly in the central portion where irrigation has been introduced and the chief products are rice, corn, and other cereals, various nuts, spices, and tobacco, sugar, coffee, valuable timbers, and medicinal plants. Raw silk is also produced on a considerable scale and one-third of it is exported. There are mines of iron, copper, zinc, and gold worked by the natives. Coal and salt are also obtained. Internal affairs are administered by Annamite officers under the control of the French government. At the head of the government is the King, Khai-Dinh, who came to the throne in 1916 and who is assisted by a Council of Ministers.

ANTARCTIC. See POLAR RESEARCH.

ANTHROPOLOGY. While quantitatively the output of research work has been seriously hampered by abnormal post-bellum conditions, which have likewise interfered with the undertaking of novel enterprises, there are gratifying indications of the recognition accorded to anthropology by outside agencies. Thus, two anthropologists, Professor Dixon of Harvard and Dr. Farabee of the University Museum (Philadelphia), were summoned as experts to the Paris Peace Conference; and America's most eminent Egyptologist, Prof. J. N. Breasted, frankly seeks aid and comfort in anthropological methods of approach (*Journal of the American Oriental Society*, vol. 39, pp. 159-184). The growing demand for anthropological instruction is equally remarkable, especially in the Far West. Thus, the University of California reports the record-breaking number of 440 undergraduate students taking the introductory course in anthropology. It is also encouraging to find that even in war-stricken Belgium an *Association pour l'étude et l'enseignement des sciences anthropologiques* has been called into being at Liège, which has already founded a School of Anthropology (*Ecole libre d'Anthropologie*) and provides for courses in physical anthropology, criminology, ethnography, prehistoric archaeology, sociology, linguistics, and the history of religions. In Germany Dr. Heinrich Cunow, editor of *Vorwärts*, and known for his writings on the social organization of the Australians and the Incas, has been appointed professor extraordinarius of ethnography and sociology at the University of Berlin. At the University of Vienna Dr. Rudolf Pösch has been promoted to a full professorship of anthropology and ethnography.

PHYSICAL ANTHROPOLOGY AND ANCIENT MAN. Despite the difficulties under which all scientific publications have had to labor during the war, the *American Journal of Physical Anthropology*, edited by Dr. A. Hrdlicka, has continued to appear. It pays special attention to the reviewing

of new literature, but also issues original contributions. Among the latter the following essays may be cited: F. Boas, "The Hair Color of the Italians" (pp. 11-14); H. Boas, "Inheritance of Eye-Color in Man" (pp. 15-20); and Dr. B. Bean and W. Baker, "Some Racial Characteristics of the Spleen Weight in Man" (pp. 1-9). In the last-mentioned paper the authors conclude that the spleen of the negro is lighter than that of the white, the average for males being 115 and 140 grams respectively. This journal also publishes a noteworthy essay on the "Origins of the Portuguese" by A. A. Mendes Corrêa (pp. 117-145). According to this author, the Portuguese are distinctly short, having a stature of 164.5 cm., and represent the most dolichocephalic type of Europe, the average skull index being 74.5, with only 8 per cent of the population broad-headed. They belong predominantly to the Mediterranean sub-race, which is purest in the mountains, but Alpine and even Nordic strains occur. From copies of the *Archiv für Anthropologie* for 1918 and 1919 that have at last reached this country it appears that the somatological branch of anthropology has been vigorously cultivated in Germany during the last few years. Rudolf Pösch has described a series of Australian skulls, Margarete Schwoerer publishes a paper on the craniology of the Ceram Islanders, Karl Steiger has devoted special study to the tibia in a district of southern Bavaria, and Bavarian skulls of the Roman period have been measured and classified by Ludwig Pröbstl. O. Walkhoff (*Archiv*, 1919, pp. 12-43) resumes his researches on the phylogenetic development of the chin. M. Pfaunder has written a book on the growth of children (*Körpermassstudien an Kindern*). He takes issue with those who consider low stature as a pathological phenomenon and holds that the excessive growth of children from the wealthier strata marks a biologically inferior status, this hypertrophy being compensated by the arrested development of the bodily functions. An Italian anthropologist, Prof. Fabio Frassetto of Bologna, has produced a three-volume work, *Lezioni di Antropologia*, which supplements, though it hardly supersedes, Martin's *Lehrbuch* as a manual of physical anthropology. The French continue their intensive studies of prehistoric remains; among them may be cited the Abbé H. Breuil's "Les Peintures rupestres de la Péninsule ibérique" (*L'Anthropologie*, XXIX, 1-28). Some noteworthy comparative papers have appeared in the British *Journal of Anatomy*, such as N. Pan's "Observations on the Gastro-Intestinal Tract of the Hindus" (LIII, pp. 259-265) and J. S. B. Stopford's "The Variation in Distribution of the Cutaneous Nerves of the Hand and Digits" (LIII, pp. 14-25). Spanish scholars are taking an active interest in the antiquities of their country, as evidenced by E. Hernández-Pacheco's *La Caverna de la Peña de Candamo*, in which work there is a detailed account of Aurignacian and Magdalenian remains.

THEORETICAL ETHNOLOGY. In a work entitled *The Evolution of the Dragon* but devoted to a variety of other subjects as well, Prof. G. Elliot Smith amplifies the general conceptions of cultural growth set forth in previous publications. Independent development is flouted as an undemonstrated and reckless, if not demonstrably false, speculation, and in its place is reared an elaborate structure of theory, according to which

practically all of civilization originated in Egypt and was thence transmitted directly or second-hand. Thus, masonry, he argues, did not evolve from an instinctive selection of stone as a suitable building material through a discovery that might have occurred again and again in different places but from the unique desire of the ancient Egyptian to make adequate provision for the welfare of the deceased. In this manner he came to cut into the rock and later substituted stone for brick in the creation of chapels. The burial practices of embalming and correlated rituals are even credited with having furnished the basis of animism. This fundamental belief, according to Smith, is not a necessary phase of religious evolution but an artificial construct due to the Egyptian mummifier. In an arid climate where irrigation was indispensable for effective agricultural effort water naturally loomed as a vitalizing instrumentality. Hence it was natural to assume as a quasi-scientific proposition that a libation before the statue of Osiris could animate the effigy and enable the original to resume existence. This notion developed in various ways. Men came to believe that the dead could enter a block of stone, leaving it and returning to it at will. Thus animism sprang into being and was widely disseminated in dissociation from its original context.

While G. Elliot Smith's views have been vigorously challenged in England, some scholars are inclined to a moderate acceptance of his belief in the far-reaching effects of diffusion. Thus, in his presidential address before the Folk-Lore Society (*Folk-Lore*, XXX, 1919, pp. 10-34), Dr. A. C. Haddon briefly summarizes the theoretical views hitherto assumed in the investigation of folk-lore and largely accepts the position which in later years has become more especially identified with the names of Rivers and Elliot Smith. More particularly he applies the principle of dissemination to certain widespread tales concerning the origin of death and shows how the stories of the Perverted Message and of the Cast Skin can be conceived to have traveled over enormous stretches of territory by utilizing our knowledge of established ethnic relations. On the other hand, Haddon still believes that certain social usages, such as cousin marriage and ultimogeniture (Junior-right) may develop independently, and the same may apply to tales of the creation of man from clay.

Very interesting hints on the study of primitive art are embodied in H. K. Haebler's posthumous essay on "Types of Ceramic Art in the Valley of Mexico" (*Amer. Anth.* vol. 21, pp. 61-70). While a general investigation of the pottery in this region establishes the superposition of three distinct layers, that of the Aztec culture overlying the Toltec one, which in turn rests on the archaic horizon, more intensive research is possible for the Aztec sub-type from Culhuacan. In this local centre it appears that the decorative patterns were executed with great haste because the pottery was destined for markets. Accordingly this factory ware bears designs revealing much less regularity than is usual. Indeed, while the ideal pattern in the artist's mind is clear from comparison of specimens, the individual samples are merely approximations to the norm differing from one another exactly as the handwriting of different individuals. Thus, certain sherds may be confidently assigned to the workmanship of one pot-

ter, certain others to another. This fact opens a new vista for the thoroughgoing examination of archaeological specimens from this novel point of view.

In the domain of sociological theory R. H. Lowie has once more taken up arms against the classical view of the priority of maternal descent, his essay on "The Matrilineal Complex" (*Univ. of Cal. Pub.*, vol. 16, pp. 29-45) being a protest against E. S. Hartland's recent defense of that time-honored doctrine. Lowie resolves the complex into a series of elements not regularly associated with one another and accordingly denies that the presence of this or that "symptom" may be taken as a survival of a former matrilineal system. The same author has enunciated a theory of the origin of the clan (sib) under the heading of "Family and Sib" (*American Anthropologist*, vol. 21, pp. 28-40). Assuming with the majority of American investigators that the family is an older unit than the sib, Lowie endeavors to discover the mechanism by which the later grew out of the earlier condition. The sib, he contends, rests on a classification of kindred and any scheme purporting to explain its origin must explain the segregation of certain kindred from others. If the sib unites the kin of only one side, whether maternal or paternal, it is because either the mode of residence or the established division of economic or industrial labor with consequent proprietary titles naturally assembles either the patrilineal or the matrilineal relatives. Thus, where all the horticultural work is done by women and gardens are owned by them, a grandmother is naturally united into a group with her daughters and granddaughters, all of them jointly constituting the core of a sib, to which newborn infants are automatically referred as soon as the unit acquires a definite name.

A valuable summary of recent speculation on primitive religion in all its aspects is offered by A. A. Goldenweiser in a paper on "Magic and Religion" (*Psychological Bulletin*, XVI, pp. 82-90). An introduction to theories on this subject is also supplied by Frederick Schleiter's predominantly critical book on *Religion and Culture*, where special attention is devoted to the doctrine of convergent evolution. Much interesting material on a special phase of religious history is compiled in W. D. Wallis' *Messiahs: Christian and Pagan*, where an attempt is likewise made to strike the balance between the potency of individual initiative and that of the circumambient social environment.

The 1915-16 issue of *Anthropos* that has only recently arrived in this country contains a continuation of the symposium on Totemism undertaken under the auspices of the editor, Father Schmidt (pp. 234-265). There are three articles on this subject: N. W. Thomas, "Totemism in Southern Nigeria"; Fr. Graebner, "Totemismus als kulturgeschichtliches Problem"; and A. A. Goldenweiser, "The Method of Investigating Totemism." Graebner's essay is interesting as another illustration of his scheme of cultural stratification and also in its assertion of the priority of local patrilineal totemism.

Comparative musical studies continue to attract that limited group of students who combine ethnographical interests with a knowledge of the indispensable musical technique. C. R. Moss and A. L. Kroeber have analyzed the "Nabaloi Songs" gathered in the Philippines

(*Univ. Cal. Pub.*, vol. XV, pp. 187-206); and Dr. George Montandon publishes an elaborate monograph on instruments under the caption of "La Généalogie des instruments de musique et les Cycles de civilisation" (*Archives suisses d'Anthropologie generale*, III, no. 1, 1919).

The methods by which animals came to be domesticated by man form one of the most fascinating and difficult problems of ethnology. So far as it relates to the reindeer it received much illumination from B. Laufer's researches, which are in part confirmed and in part revised in Gudmund Hatt's "Notes on Reindeer Nomadism" (*Memoirs, Amer. Anthr. Ass.*, VI, no. 2, 1919). This scholar agrees with Laufer in holding that the notions of riding and of milking reindeer originated in the imitation of processes connected with horse and cattle-breeding. However, he regards these phenomena as relatively recent additions to the reindeer culture and connects the older idea of harnessing reindeer to sledges with the corresponding utilization of dogs because of the striking resemblance between the harnesses used on dogs and reindeer. According to Hatt, the first domestication of the reindeer was due to a hunting people thoroughly conversant with the habits of the species. He assumes that the primary motive in tending captured reindeer was to use them as decoys in luring members of wild herds. A symbiotic relationship would develop between the tamed animals and man; in return for their services he would protect them against beasts of prey, the smoke from his camp-fires warded off mosquitoes, and the strange appetite of reindeer for human urine bound them to the hunters' settlements. Hatt admits that reindeer nomadism is comparatively recent in the history of culture and expressly declines to put its origin into the European Stone Age. On the other hand, he does not accept as evidence of great recency the slight degree of domestication, which seems to him inseparable from the migratory nature of the species and the development of its domestication from reindeer hunting.

AMERICA. An extremely radical attempt at linguistic synthesis is essayed in P. Radin's "The Genetic Relationship of the North American Indian Languages" (*Univ. of Cal. Publications*, vol. XIV, pp. 489-502), where all the stocks of North America are reduced to a single family. This result has by no means been accepted by other students and is vigorously assailed by T. Michelson (*American Journal of Philology*, XL, 316-321). Far more conservative than Radin's synthesis is that of R. B. Dixon and A. L. Kroeber in their joint paper on "Linguistic Families of California" (*Univ. of Cal. Pub.*, vol. XVI, pp. 47-118). For several years these investigators have sought to reduce the 22 stocks assumed in Powell's classification, and the present paper offers a final summary of these efforts. The result is that Yuki remains as the one isolated tongue, the remainder of the distinctively Californian languages falling into either the Penutian or the Hokan category. The Penutian stock includes Wintun, Maidu, Yokuts, Miwok, and Costanoan; the Hokan stock, Karok, Chimariko, Shasta, Pomo, Yana, Esselen, Yuman, Chumash, Salinan, and Washo. Following Sapir, Dixon and Kroeber accept Yurok and Wiyot as related to the Algonkian languages so widely diffused east of the Rockies.

Folk-tales continue to be published on a sur-

prising scale. Under the editorship of T. Michelson the American Ethnological Society has issued vol. II of the vast mass of *Ojibwa Texts* collected by the lamented William Jones and in the 32nd Report of the Bureau of American Ethnology J. N. B. Hewitt presents *Seneca Fiction, Legends, and Myths*, garnered partly by himself and in part by the late Jeremiah Curtin. A substantial body of Plains Indian lore is offered by R. H. Lowie under the caption of *Myths and Traditions of the Crow Indians*, while P. E. Goddard has added to his San Carlos Apache material a set of *Myths and Tales from the White Mountain Apache*. French Canadian folk-tales and songs have been brought together through the enthusiasm of M. C. M. Barbeau in a special number of the *Journal of American Folk-Lore* (vol. 32, no. 123). Tho Stith Thomson students owe a long-needed investigation of *European Tales among the North American Indians*, an essay on the migration of folklore.

An interesting synthetic study of a type hitherto neglected is offered in Miss Leona Cope's "Calendars of the Indians north of Mexico" (*Univ. of Cal. Pub.*, vol. XVI, 119-176). She finds that three fundamental principles are in vogue, the astronomical, the descriptive, and the numerical. The method of numbering the months is restricted to the Northwest Coast and neighboring regions to the north and south. Both in the Northwest and Southwest astronomical conceptions appear, with the solstices occupying the pivotal place. In the remainder of the continent purely descriptive designations referring to manifestations of the animate and plant kingdom or other natural phenomena predominate, while no use is made of the solstices or of any intercalary device for bringing the lunar and solar year into accord.

A subject that has elicited an infinitude of discussion has received partial elucidation in Leslie Spier's paper on *The Trenton Argillite Culture*. At Trenton archaeologists have distinguished three strata—the surface of black humus about 6 inches in depth; the yellow sand from 1 to 6 feet deep; and the stratified gravels extending at least to the flood plains of the Delaware. The uppermost layer contains relics of historic Indians; to the yellow sand a ruder culture has been ascribed by previous investigators; while some have interpreted remnants in the lowest stratum as genuinely Palæolithic finds. Spier confines his attention to the intermediate zone. He confirms the older results of Abbott and Volk to the effect that the yellow sand harbors cultural remnants representing a simpler and older stage than that of the historic Indians of the region. The lack of pottery is especially noteworthy, as is the absence of drilled stones. Large stone blades and arrowheads, pitless hammerstones, rubbing stones and fire-fractured pebbles are the only specimens found. Half of the remains are of argillite, whence the name of the culture, which has so far remained unique, no definite affinities having been discovered elsewhere.

Research in the Southwest continues to be cultivated with assiduity. A. V. Kidder and S. J. Guernsey's *Archæological Explorations in Northeastern Arizona* ranks as possibly the most important contribution of the year. The authors establish a "Basket Maker" culture related to that of Grand Gulch, Utah, and presumably antedating that of the Cliff-dwelling peoples, though

it remains doubtful whether the Basket Makers represent the prototype of the later culture or an independent line of evolution possibly now extinct, possibly persisting in modern Shoshonean tribes, such as the Paiute and Ute. Of the relative simplicity of Basket Maker life there is no doubt. Pottery was either rare or wholly lacking, corn was cultivated in a single variety, beans were not grown at all, the turkey was not domesticated, and there was no loom cloth. The people probably lived in the open during part of the year, erecting temporary shelters, and used caves only in severe weather and without erecting substantial houses in them. Basketry was extremely abundant and of the coiled type but without interlocking stitches. The occurrence of the spear-thrower coupled with the absence of the bow is significant since that device has a peculiar range, embracing Mexico, Florida and Santa Barbara, Cal. Somatological research may lead to a definite identification of the Basket Makers, since the skulls are dolichocephalic and rather markedly scaphoid, the lack of deformation setting them off from the Cliff-dwellers. Trade relationship with California is suggested by the presence of abalone shell. On the whole Kidder and Guernsey incline to the theory that the Basket Makers represent the first step in the evolution of a full-fledged Pueblo civilization, the Slab-house culture being of an intermediate stage.

A simple Southwestern culture is also revealed by W. Hough's "Exploration of a Pit House Village at Luna, New Mexico" (*Proc. U. S. National Mus.*, vol. 55, pp. 409-431). Though presumably maize-growers, the Pit House people differ from the typical Pueblo Indians in lacking axes, hoes, digging-stones, large chipped objects, pipes and pottery figurines. There is a strange absence of burials, possibly suggesting that cremation or open-air exposure was practiced. The houses themselves were semi-subterranean, projecting about 3 feet above ground; the sides were presumably wattle and daub or earth; the ground plan was circular; and the roof was supported on eight poles. The Indians seem to have walked up the roof and descended through a hatchway by a notched ladder. A village would be constituted of a series of such circular mounds, with a sprinkling of rectangular open-air sheds and a marginal palisaded dance circle.

Another noteworthy monograph dealing with the archæology of this region is E. H. Morris's *The Aztec Ruin*. It is devoted to the principal member of a large group of prehistoric ruins in northwesternmost New Mexico, which Morris affiliates with the famous site of Pueblo Bonito, where a similar style of architecture occurs. A study of ceramics leads to the establishment of three distinct periods, and by synthesizing his results with those of Kidder and Nelson the author arrives at an interesting chronological theory. According to this, the basis of Pueblo culture is to be sought in the canyons north of the San Juan River and to have thence spread after a considerable lapse of time into the Rio Grande Valley since the earliest earthenware of that region is clearly related to the latest pottery of the Aztec area.

In the *Contributions from the Museum of the American Indian* (vol. V, no. 2) E. H. Davis publishes an account of "The Diegueño Ceremony of the Death Images," the first report based on

personal observation of this important South Californian ritual. In this ceremony an effigy of the dead is prepared and finally cremated after much chanting and dancing. The expense of the festival, which is enormous, devolves on the family of the deceased, who must compensate the director of the singing and dancing, the men who perform with the image, and the fire-tender. Nowadays they are also required to furnish coins to be thrown in handfuls among the spectators. Another Californian solemnity belonging to the central parts of the State is described in S. A. Barrett's "The Wintun Hesi Ceremony" (*Univ. Cal. Pub.*, vol. 14, pp. 437-488). The Hesi lasts four days and nights. Its main object is to insure plentiful harvests of wild fruits and seeds and to promote the general prosperity of the people. In the same volume (pp. 221-436) L. L. Loud publishes a substantial monograph on the "Ethnogeography and Archaeology of the Wiyot Territory." Excavation in this region demonstrates that the older inhabitants cremated corpses while at a later period this method gave way to burial in a straight position. In material culture the ancient occupants of the area belong with the recent natives of the Klamath River region. The peculiar implements called slave-kills even suggest relations farther north extending as far as Puget Sound.

In the East work has been preponderantly archaeological. One of the most famous of curiosities is redescribed and interpreted in C. C. Willoughby's "The Serpent Mound of Adams County, Ohio" (*American Anthropologist*, vol. 21, pp. 153-163). "Mountain Haunts of the Coastal Algonquian" (*ibid.*, pp. 139-152) are reported by Max Schrabisch. Under the auspices of the Museum of the American Indian G. G. Heye figures and describes "Certain Mounds in Heywood County, North Carolina" (*Contrib., Mus. Amer. Indian*, vol. V, no. 3), while an intensive "Exploration of Aboriginal Sites at Throgs Neck and Clasons Point, New York City" is recorded by A. Skinner (*ibid.*, no. 4). Skinner argues that at Clasons Point there is evidence of Iroquois influence, which is attested by the abundance of excellent bone and antler work; while at Throgs Neck an upper stratum of comparable type rests on a layer of archaic Algonkian specimens devoid of Iroquois pottery forms.

Speck has described *The Functions of Wampum among the Eastern Algonkian*. He finds that presumably the earliest use of wampum was for ornamentation, and this, though shared by the Iroquois, probably originated in Algonkian tribes. On the other hand, the more serious functions of the beads in association with death messages, peace and war negotiations, and as payment for homicide developed among the Iroquois and were thence transmitted to the Wabanaki. However, the utilization of wampum in proposals of marriage is a local Wabanaki product, probably stimulated by the ceremonial use of the substance copied from the Iroquois.

South American scholars have not neglected their opportunities to study aboriginal life. The veteran Argentinian investigator, Dr. Samuel A. Lafone Quevedo, stimulated by Rivers's kinship studies has issued a paper on "Los Términos de Parentesco en la Organización social Sud-Americana," dealing with the Guaira region (*Revista de la Universidad de Buenos Aires*, XXXVII, 5 et seq.) and sums up his views of South American native psychology in a general

paper on "Rasgos psicológicos de Indios Sud-americanos" (*Revista del Museo de la Plata*, XXIV, part 2, pp. 63-81). The origin of the Bola and the Lasso is discussed by Dr. M. Leguizamón (*Revista de la Universidad de Buenos Aires*, XII, 206 et seq.).

In Part I of a *Handbook of Aboriginal American Antiquities* (Bulletin 60, Bureau of American Ethnology), Prof. Wm. H. Holmes discusses the processes of stone-working employed by the North and South American aborigines with a profusion of explanatory illustrations and also sums up the most general results of his life-long researches. He re-affirms the view that the New World has not been settled at a period of remote antiquity. The geological evidence hitherto adduced does not warrant belief in a Pleistocene, let alone Tertiary occupancy of the continent, which was presumably not reached until after the final retreat of the glacial ice from middle North America. Archaeologically, relics of Paleolithic shape cannot be accepted as chronologically separable from those of Neolithic craftsmanship and are merely incomplete tools rejected owing to some imperfection. Man, then, must be assumed to have reached America from without and at the Neolithic cultural level, presumably by way of Bering Strait. Subsequent cultural influences from the Old World are conceivable but cannot be at present regarded as proved, and at all events they have not been far-reaching enough to prevent the natives of the Western Hemisphere from representing a homogeneous whole as set over against the rest of the globe.

OTHER CONTINENTS. Under the heading of *Sino-Iranian* B. Laufer presents an exhaustive treatise on the Iranian stratum in the civilization of China, more particularly as regards the transmission of cultivated plants. This process commenced in the latter part of the second century B.C., when alfalfa and the grape-vine were introduced, and there followed a borrowing of Iranian and Central Asiatic plants until the fourteenth century. Laufer's monograph is important for its methodological no less than for its concrete historical results. It proves that merely botanical considerations are inadequate for determining the history of a cultivated species. Thus, wild vines occur in China, but viticulture did not originate there; indeed, it developed as late as 640 A.D. under the influence of a Turkish tribe of Turkistan. Similarly, the walnut is indigenous to China, as well as to the Mediterranean region, but Iran was the home of the cultivated varieties, which spread thence to Greece, India, Central Asia, and China. Laufer further discusses the features of civilization for which the Iranians were indebted to the Chinese, such as silk, the peach and apricot, paper and paper money, so that his volume is really a contribution to the history and spread of culture generally.

"Some Aspects of Nayar Life" (*Journ. Royal Anth. Inst.*, XLVIII, pp. 254-293) are illuminated by K. M. Panikkar. The Nayar, whose territory stretches from Gokarnam to Cape Comorin along the Arabian Sea, differ from many other Indian peoples in having a village organization in which the rights of individual property are fully recognized. The family is organized matrilineally. Contrary to earlier information that ascribed a particular form of polyandry to this tribe, the Nayar do not practice this form

of marriage but merely grant certain social privileges to the husband's brothers. As to Rivers's theory of a close relationship between the Nayar and the Toda, Panikkar maintains that the connection is solely that of neighboring tribes.

Under the auspices of the Imperial University of Tokyo, R. Torii has published a valuable monograph on "Les Ainu des Iles Kouriles" (*Journal, College of Science*, XLII). Unlike their brethren in Yezo and Saghalin, the Ainu of the Kuril Islands have been almost wholly neglected and Torii was obliged to study a miserable remnant of 57 individuals rapidly approaching extinction. They show interesting features in common with the northeastern Siberians, such as semi-subterranean winter houses and the use of wooden masks, which represent cannibalistic spirits. The Bear festival so prominent among the Ainu of Japan is lacking in the north and accordingly appears to be of Gilyak origin. Of the industrial activities of the natives the former manufacture of pottery is noteworthy.

Tallgrén and other European scholars have advanced our knowledge of Siberian archaeology and history, and their most general results have been rendered accessible to English readers by Miss M. A. Czaplicka's book on *The Turks of Central Asia* and B. Laufer's critical comments (*American Anthropologist*, XXI, 78 et seq., 198 et seq.). It seems clear now that the people of the Bronze and Iron Ages of southern Siberia were of Turkic stock. The ancient home of this family must be sought in what is now southern Mongolia, where its members dwelt until the second century B.C. On the other hand, Turkistan was originally peopled by Iranians and other nations of Indo-European speech, who were only secondarily swamped by Turkic invaders. These undoubtedly were profoundly affected by Iranian cultural influences. It is important that in the Bronze Age burial mounds of South Siberia series of long skulls with an average index of 83.2 and 74.6 have been unearthed since all the recent occupants of this region are markedly brachycephalic, the majority ranging from 81 to 87 approximately. This suggests that the former inhabitants represented a racial type distinct from that of their successors.

In a paper on *Kinship in the Philippines* A. L. Kroeber reconstructs the ancient kinship nomenclature of the Filipino peoples. He finds that it is based primarily on the differentiation of generations and in general accords with the social scheme characteristic of the Islanders. Thus, the equality of the sexes is reflected in the paucity of sex-limited terms of relationship. Again the accentuation of consanguinity goes hand in hand with a tendency to merge lineal and collateral kindred. Linguistic factors are not to be ignored but they have only superficially modified the aboriginal systems. In a more ambitious essay on *The History of Philippine Civilization as reflected in Religious Nomenclature* the same author draws a distinction between the Igorot peoples of northern Luzon and all other Filipinos, the unique position of the former being partly corroborated by their racial diversity. It is remarkable, however, that the several Igorot tribes have undergone much diversification among themselves. Nevertheless, both Igorot and non-Igorot populations must be recognized as sharers in the same fundamentals of culture, the precise history of whose variations is one of extraordinary intricacy. Kroeber's results are most in-

teresting as regards the character and extent of Hindu influence. He does not incline to the view that natives of India themselves carried culture to the Islands but rather that the Filipinos absorbed the higher constituents of their civilization second-hand from Hinduized Malaysians. As regards religion, Hinduism was not transmitted as a unified system but merely in odd elements, which presumably entered the archipelago by various routes and were adopted more or less uniformly outside the Igorot region. Kroeber insists that the Filipino problem cannot be solved as such but only as part of the greater Malaysian puzzle, a conclusion he applies not merely to ritual and belief, but also to the spread of metallurgy, rice cultivation and other traits.

In the *Journal of the Polynesian Society* a number of worth-while articles on relatively little-known Oceanian groups are issued. Among the papers of the year may be cited S. H. Ray's "Polynesian Linguistics," including a sketch of the Santa Cruz dialect, and Rev. P. H. Audran's "Traditions and Notes on the Paumotu Islands." The first attempt at a grammar of the Sulka language of New Britain is made in *Anthropos* (1915-16, pp. 75-97) by Brother H. Müller. Valuable information on the Yarlalde and other Southeast Australian tribes is furnished in A. R. Brown's "Notes on the Social Organization of Australian Tribes" (*Journ. Royal Anth. Institute*, XLVIII, pp. 222-253), which follow the pattern of his earlier article on the Kariera.

A valuable account of the secret societies flourishing among the Kouyou of French Equatorial Africa is furnished by M. A. Poupon (*L'Anthropologie*, XXIX, 53-88, 297-335). There is a Panther organization presided over by the chief, with whom the animal species is considered related, from which women are barred; but the women have a corresponding society of their own, from which men are excluded with equal rigor. Of greater dignity than the rest is the "Ottote" fraternity, composed solely of affluent men since initiation involves a payment to the amount of two hundred francs. Membership, however, confers important judicial and political prerogatives, as well as instruction in the knowledge most highly prized by the natives. Of the social usages practiced by this people the rule imposing avoidance of a man's mother-in-law and the taboo preventing an adult brother and sister from being together are of comparative significance. A contribution to our knowledge of the magico-religious societies of the Ivory Coast is made by M. Prouteaux (*ibid.*, 37-52).

Though the pursuit of Africanist studies in this country has suffered a grievous loss through the death of Mr. Oric Bates, efforts are made to continue the plan of publication projected by him and a second volume of the *Harvard African Studies: Varra Africana* II has been issued. It embraces a large number of important papers, among them a detailed study of "The Kababish, a Sudan Arab Tribe" by Dr. and Mrs. C. G. Seligman and Prof. A. Van Gennep's "Recherches sur les Poteries peintes de l'Afrique du Nord française." There is also a worth-while account of "Certain Rites of Transition and the Conception of Nau among the Hottentots" by Mrs. A. W. Hoernle.

EXPEDITIONS, MEETINGS, PERSONALIA. Though still suffering from the effects of the war, field-work has in some measure been resumed during the past year. For the Bureau of American

Ethnology Dr. John R. Swanton practically completed his investigation of the social life of the Choctaw and Chickasaw; Mr. F. La Flesche continued work among the Osage; Mr. Gerard Fowke conducted excavations in Miller Cave, Missouri; and linguistic research in Oklahoma and the Southwest was undertaken by Mr. J. P. Harrington. A grant from the same institution enabled Prof. J. E. Pearce of the University of Texas to examine a site in the vicinity of Austin. Under the auspices of the U. S. National Museum Dr. W. Hough resumed his ethnological and archaeological studies in Arizona. The American Museum of Natural History financed a visit by Dr. Clark Wissler to the ruins at Aztec, N. Mex., and to the mound area of Ohio. A Columbia University traveling fellowship provided for Mr. Leslie Spier's continuation of work among the Yuman peoples of Arizona. The Museum of the American Indian, Heye Foundation, supported a number of trips by Mr. Alanson Skinner and others to the vicinity of New York, Pennsylvania, and Wisconsin, while Mr. F. W. Hodge again directed the excavations at Hawikuh, N. Mex. For the University of California Mr. E. W. Gifford resumed his researches on the social life of the aborigines. From England Mr. W. E. Armstrong has started for intensive field-work in southeastern New Guinea; Mr. A. M. Hocart has been appointed archaeological commissioner in Ceylon.

The annual meeting of the American Anthropological Association and American Folk-Lore Society took place in Cambridge, Dec. 29-31, 1919.

Unusually severe has been the toll of death since the beginning of 1918, some of the European losses only coming to the notice of Americans in the belated issues of journals that have only recently come to this country. France has lost Dr. Joseph Deniker, famous for his book on *Les races et les peuples de la Terre*; Dr. Léon Poutrin, the investigator of Pygmy races; Prof. Victor Commont, the noted archaeologist; Emile E. Guimet, the founder of the Guimet Museum; and Paul Sébillot, most distinguished of French folklorists. Austrian scientists mourn the death of Prof. Moritz Hoernes, the well-known archaeologist. In America Dr. Frank Baker, a pioneer student of physical anthropology, has passed away.

ANTIGUA. See JEEWARD ISLANDS.

ANTI-SALOON LEAGUE OF AMERICA.

A national federation of organizations whose object is the extermination of the beverage liquor traffic, founded in 1895 by the coalition of the Anti-Saloon leagues of five States. In 1919 it had 50 subsidiary State leagues and was working in coöperation with more than 40 other national temperance leagues. The League had a force of more than a thousand workers and officers. It has been very active in the enactment of national prohibition in this country, and is not slackening its campaign until it is sure that prohibition has come to stay. It is claimed that the "wet" interests are misrepresenting the various dry laws to the people in the hope of a repeal, and the League has taken up the task of explaining the provisions of the Legislature, and showing the people that the country is far better under national prohibition than it was before. Statistics have been brought forth showing a great decrease in crime since prohibition, and a general improvement of the condition of

the lower classes. The officers of the League emphatically deny, however, that they intend to launch any anti-tobacco campaign, and claim that such a report was circulated by its opponents to create public sentiment against the League. At a conference in Chicago on September 17th-18th, the officers of the League together with the officers of the State organizations, decided that a fund of fifty million dollars should be raised during the next five years. Twenty-five million of this was to be used on direct State, national, and world-wide work, while another 25 million was to be used in the Americanization of foreigners and in the world-wide prohibition fight in foreign countries, through the coöperation of the World League Against Alcoholism. It was the unanimous decision that the next step for the League was in the direction of education, especially with foreigners and foreign-born Americans. Much work was anticipated in foreign countries during the year 1920, there being already at the close of 1918 17 officials of the League abroad working with the temperance forces in various countries, and more expecting to be sent shortly. Prohibition of the manufacture and sale of intoxicating liquors had been adopted by the Dominion of Canada, Newfoundland, Greenland, Iceland, the Faroe Islands, Russia, Finland, and Rumania for the period of the war. Partial prohibition had been effected in 10 other countries and forces were working to make this complete.

The officers of the League for 1919 were Bishop Luther B. Wilson, president; Hon. S. E. Nicholson, secretary; Forest Copeland, treasurer; Rev. P. A. Baker, general superintendent; Ernest H. Cherrington, general manager of publishing interests. *The American Issue* is the official organ of the League, and there are 29 subsidiary and State organs. The publishing house and executive offices are in Westerville, Ohio, where three tons of literature are turned out daily except Sunday. The legislative committee has its headquarters in the Bliss Building, Washington, D. C.

ANTONIA, MARIA. See MUSIC, Artists, Instrumentalists.

APPENDICITIS. The intimate nature of this affection appears to be as obscure as ever; that is to say, there is no theory which is acceptable to all authorities. Until recently the belief has gained converts that the disease results in the main from the entrance into the blood of germs of low virulence which possess a selective affinity for the appendix as a place for localization and development; the appendix being one of a large number of organs selected by various strains of bacteria for this purpose. It can readily be shown by experiment on animals that special strains select their own breeding places in the body. Nevertheless this plausible view does not conform to the experience of individual pathologists. Thus Sandelin, a Finnish physician, as a result of a large experience in the study of diseased appendixes, regards the essential or determining cause of appendicitis as anatomical and mechanical. An infection is of course required before the disease can develop, but it will develop only in organs as a consequence of some congenital or acquired malformation, which favors stagnation in the organ as a result of partial or complete obstruction. The offending microorganisms are those which chance to be present in the organ and which have their virulence enhanced by retention in the cul-de-sac

which we call the appendix. Almost at the same time a well known French pathologist has come to conclusions not entirely inharmonious with the preceding. He has satisfied himself that acute appendicitis does not arise by extension from other organs but *de novo* in the appendix itself. Infection could not occur unless some causal factor is present to cause slight loss of substance in the lining of the canal. For years he has been developing a technic to demonstrate the presence in the organ of the ova of the various forms of intestinal worms and as the work progresses he is finding them in a constantly increasing per cent. The presence of the ova by causing slight microscopic wounds of the epithelium, makes it possible for the local bacteria to infect the organ.

AQUEDUCTS. In order to provide an additional daily supply of not less than 500,000,000 gallons for the city of New York in connection with the original Catskill Aqueduct project, an 18 mile tunnel in rock, and a dam 160 feet high, with both masonry and earth sections, were under construction in 1919 at an estimated cost of some \$22,000,000. This Schoharie development involves the construction of the Gilboa Dam, forming a diversion reservoir of 20,000,000,000 gallons capacity, from which the flow will be through the 18 mile Shandaken Tunnel into Esopus Creek, and thence along the original stream bed into the Ashokan Reservoir. The Gilboa dam is discussed elsewhere in the YEAR BOOK under DAMS. The Shandakan tunnel was designed for a maximum capacity of 600,000,000 gallons a day, to be operated intermittently and at varying rates, depending upon the conditions of stream flow and storage. The tunnel has a maximum internal height of 12 feet and internal breadth of 10 feet three inches. The construction was to require about 5.7 cubic yards of excavation per linear foot of tunnel. During the year 1919 the sinking of seven intermediate shafts, concrete lined, 14 feet diameter, was accomplished. The aggregate depth of these shafts is 3238 feet, with a maximum depth of a single shaft of 630 feet. The distance between shafts varies from a minimum of 1.3 miles to a maximum of 2.7 miles.

COLUMBUS, OHIO, PROJECT. On Nov. 4, 1919, the city of Columbus, Ohio, voted to authorize the issue of \$3,000,000 water bonds in order to increase the present storage capacity of the Scioto River so as to provide 55,000,000 gallons daily and to enlarge the purification and pumping works. The plan involved the raising the height of the Scioto River dam six feet, and the construction of a masonry river dam 67 feet high from the river bed to the spillway, located two miles north of Dublin, in order to provide 5,833,000,000 gallons storage. The cost of the raising of the old dam would be \$123,200, and the proposed Dublin dam would cost \$1,250,700 and the Dublin reservoir \$635,000. The various other improvements in connection with the water softening and filtration works, the pumping equipment and the raising of the intake dam, with the reinforcement of the distribution system, would bring the total expense to nearly \$3,000,000.

JERSEY CITY AQUEDUCT. In the aqueduct furnishing the water supply for Jersey City from the Boonton Reservoir, a distance of some 20-odd miles, both the Passaic and Hackensack Rivers are crossed by the conduit. During the year

1919 a 452-foot inverted siphon of six foot steel pipe encased in three inches of wire reinforced concrete was launched and lowered into position in 26 feet of water at the Passaic River crossing. The pipe used was of special design and was erected on the shore and moved to its position in the trench without cracking the concrete casing during the operation. In the original crossing of the Passaic and Hackensack Rivers, the pipe was erected on the shore and dragged into the water by means of a hoisting engine on the opposite bank. The pipe was made of six-foot riveted steel 11/16 inch in thickness, with pre-cast concrete rings, which were slipped over as the riveted connections were made, the clearance space between the rings and the steel pipe being grouted with Portland cement grout. The covering not only protected the pipe, but also gave sufficient weight to keep the pipe from floating when pumped out. In the construction undertaken in 1919 to duplicate the portions of the original concrete, another pipe of 72 inches inside diameter was laid at the river crossings on a line parallel to the original. Instead of using pre-cast concrete rings, this later pipe was covered with concrete by the use of a cement gun, and the entire section was built on shore and launched in one piece. This pipe was composed of ¾-inch steel plates riveted into sections at the shop and erected at the site, where it was covered with a heavy wire mesh and concreted so as to secure the three inch layer with lugs to support pre-cast concrete weights. This feature later was abandoned, and cast iron blocks were to be slung over the pipe at 16-foot intervals, each block weighing 2¼ tons, so that the total weight suspended at each point would be 4½ tons. The new section under construction consisted of a level portion in the bend of the river and goosenecks at each shore end. The bed of the river was excavated for the reception of the pipe, and a large trench was dug upon the shore for the shore section of the pipe line down to the water's edge. For the shore launching ways a narrow gauge track was laid in the bottom of the trench, upon which ran small steel cars at intervals of 20 feet, on which the steel pipe was blocked up and securely wedged as it was erected. For the portion crossing the river a double line of 30-inch gauge light railroad track was built on timber trestles with 12-foot clearance between the tracks, paralleling both the shore and the river trenches. Upon these tracks light railway cars were run at 25-foot intervals, and blocked up on these cars were beams upon which rested crabs to raise or lower the pipe as required. The pipe was duly erected and carried forward and then was lowered into its proper position, where it was sunk by the admission of water, and coffer dams were built at each end to connect it with the yard line. The Passaic crossing having been accomplished, a crossing of the Hackensack, which was upwards of 1000 feet in length, was being undertaken by the same contractors.

MONTREAL AQUEDUCT. The head gates and bridge structure for the Montreal Aqueduct enlargement were reaching completion in 1919. This structure made of reinforced concrete involved a bridge carrying the Montreal-Lachine road over the new aqueduct or canal, and carries three Stoney gates, which are mounted between four towers. The headgates admit water from

the St. Lawrence canal into the aqueduct canal, which will afford water supply and power, the canal at this point being about 185 feet in width. The three bridge piers are 65 feet on centres and the gates are 58½ feet long and 18 feet high, giving a clear waterway 57 feet wide and 17 feet high. The bridge carries two sidewalks and an archway, with a provision for a future double line of street railway tracks, and the operating mechanism of the gates is contained in four towers which are connected at their tops by a second or upper bridge, which affords an operating platform. The piers and the cutoff wall are carried to bed rock, from which point towers rise about 90 feet. Each gate weighs about 60 tons and is counter weighted, so that it may be operated by hand.

WINNIPEG AQUEDUCT. A novel and interesting method of back filling a tunnel through holes bored from the surface was carried on successfully in the tunnel of the new Winnipeg Aqueduct where it passes under the Red River. This tunnel is 70 feet below the high part of the ground and 40 feet below the river level, and is a 10 x 10 foot square excavation, in which is placed a 60 inch cast iron pipe carrying the water. The tunnel bore runs through solid limestone rock, the rock roof being about 17 feet in thickness with overlying sills of various natures. While the rock was fairly hard it was badly seamed in places, so that the contract required that after the cast iron lining for the water was in place, the remaining space in the tunnel bore was to be back filled in such manner as to secure an absolute filling of all irregularities and pockets. The use of compressed air in placing the concrete was forbidden, consequently holes were bored from the surface through the roof of the tunnel and lined with six-inch well casing from the surface to the rock. A light trestle was built across the river to carry the concrete across, and the concrete was poured through the pipes into the tunnel proper, the boring being carried on in sections cut off by bulkheads made of concrete.

ARABIA. A large peninsula of southwestern Asia lying to the south of Syria, Mesopotamia, and the Persian Gulf. Its area is estimated at 1,200,000 square miles or, excluding the Syrian desert and the Sinaitic Peninsula about 1,000,000 square miles; and its population is variously estimated, the highest figure being 7,500,000. As was noted in the previous YEAR Book the Arabians shook off the yoke of the Turks in the third year of the war, and in November, 1916, Hussein, the Grand-Sherif of Mecca, was crowned King of the Hejaz (or Hedjaz). Aided by British armies the Arab troops made steady progress in 1917 and during the spring of 1918. Before the termination of the war they had thrown out of action some 40,000 Turkish soldiers. In 1919 the political status of the divisions comprised within the geographical boundaries of Arabia was indeterminate. They included the following: The kingdom of Hejaz; the central Arabian emirate of Nejd and Hasa; the emirate of Jebel Shammar; the principality of Asir; the principality of Yemen, the British protectorate of Aden; the sultanate of Oman; and the sultanate of Kuwait. A large part of the country consists of desert and barren plain and the inhabitants are for the most part nomadic Bedouin tribes where the land is habitable. In the sand belt of the

north and throughout the great southern desert the land does not support human life though at certain seasons it affords grazing grounds; but in central Arabia there are oases of great fertility and along the coast there are fertile districts which are inhabited by settled communities.

HEJAZ. The Kingdom of Hejaz has an area estimated at 96,500 square miles with a population estimated at 300,000, and is the chief state of Arabia, having the two principal cities, Mecca with a population of 80,000, and Medina, with a population of 40,000. It was included within the vilayet of Hejaz in the former Turkish empire and was the chief centre of Turkish influence. Taking advantage of the Hejaz railway the Turks maintained garrisons in the ports and the chief towns of the interior. The vilayet paid an annual subsidy to the Ottoman government, but there was always a spirit of independence in the region and a hatred of the Turkish administration. Even under the Turkish régime the sherif or emir of Mecca as the legitimate keeper of the holy places exercised a great influence throughout the Moslem world. The settlement of political status was one of the questions before the Peace Conference in 1919 and occasioned afterwards some friction between France and England on account of the former's belief that English diplomacy favored the expansion of Arab influence into Asia Minor to the detriment of French interests in Syria. (See WAR OF THE NATIONS, paragraph on *Syrian Question*.) The King of the Hejaz after 1916 was Hussein ibn Ali, whose son Faisal represented the country at the Peace Conference. Early in January, 1919, the King captured Medina and his representative made an official entry into the city on January 13th.

OTHER DIVISIONS. The emirate of Nejd and Hasa comprised the two chief central Arabian principalities and exercised authority over the oases in the neighborhood of Riyadh, the capital. It sprang from the old Wahabite empire founded in 1745. The head of the state in 1919 was Abd el-Aziz, who drove the Turks from Hasa in 1913.

The emirate of Jabel Shammar lies to the north of Nejd from which it was split off about 1850. The capital is the Bedouin city of Hail, and the emir in 1918 was Abd el-Aziz, er-Reshid.

The principality of Asir lies on the western coast between Yemen and Hejaz with its capital at Sabryah, and its ruler in 1919 was Mohammed ibn Ali, el-Idrisi.

The principality of Yemen with its centre at Sana was under a family of Imams, who traced their descent to the prophet's daughter, Fatima. The Imam in 1919 was Yahya Mohammed Hamid ed-Din. For brief mention of the remaining divisions, namely, Aden, Oman, and Koweit, see those respective titles.

RAILWAYS. During the year 1919 the completion of a narrow-gauge railway, approximately 30 miles in length, from Aden, the seaport of Arabia, to Lahej, capital of the Abdali tribe in southwest Arabia was announced. This was originally a military railway and the first eight miles were built in 1915 to bring up supplies for the British forces operating against the Turks in that region. Its utility and commercial possibilities were seen, so that it was completed after the armistice, all work being done by the Royal Engineers. After the completion

of the line to Lahej, its further extension to the Yemen plateau, 200 miles north of Aden, where the world's supply of Mocha coffee is grown was a logical development which was under serious discussion.

ARBITRATION, INTERNATIONAL. See INTERNATIONAL PEACE AND ARBITRATION.

ARBITRATION AND CONCILIATION, INDUSTRIAL. The signing of the armistice was the signal for the breaking out of unprecedented industrial disputes and labor troubles in this country. During the war, such disputes were met and solved by the National War Labor Board (q.v.) or through other government agencies. After the signing of the armistice, these offices were closed one by one, until the solution of industrial disputes was on its original pre-war basis. Labor troubles increased in importance until a series of strikes in major industries (see STRIKES AND LOCKOUTS), necessitated the taking of some action.

The First Industrial Conference called by President Wilson held its first session in Washington on October 6th. The programme, so far as there could be one expressed, was to consider "the fundamental means of bettering the whole relationship of labor and capital," including the discussion of the public's interests in strikes and lock-outs, the question of the closed and open shop, and labor's right of collective bargaining. Three main groups were represented, the employers, the employees, and the public. Among those present were: For the public, Bernard M. Baruch, John D. Rockefeller, Jr., Judge Elbert H. Gary, Dr. Charles W. Eliot, John Spargo, Lillian Wald, and Ida M. Tarbell; for employers, representatives of the Chamber of Commerce, farmers' organizations, and the Investment Bankers' Association of America, and the National Industrial Conference; for employees, representatives of the American Federation of Labor, including Samuel Gompers, Frank Morrison, and Matthew Woll, and representatives of the railroad brotherhoods.

The conference was opened by Secretary Wilson, and Franklin K. Lane, Secretary of the Interior, was chosen as permanent chairman. It was decided that no member of a group might present a subject to the conference, without the consent of his group. Voting was determined by groups, thus making all votes either unanimous or a two-to-one result. A general Committee of Fifteen was selected to pass upon all suggestions before they were submitted to the floor. A number of proposals were made for temporary industrial truces, and offering plans of solution. It soon became apparent that the conference was not in harmony. An absolute deadlock was reached on the subject of collective bargaining. No satisfactory compromise could be reached. Finally, on October 22nd, Mr. Gompers offered a resolution recognizing the right of wage-earners to organize, to bargain collectively, and to be represented by representatives of their own choosing. The public group indorsed the resolution, the labor group was in favor of it, but the employer group voted against it by a small majority. Immediately, the labor group withdrew, and no further action was taken by the conference. Although nothing tangible was a result of this conference, the leaders expressed their opinion that the publicity which it gave to the problem of arbitration and conciliation was most valuable.

A second Industrial Conference was called by President Wilson after the failure of the original conference. The new body was much smaller and more compact, representing the public, only. This conference was convened on December 1st, and presented a tentative report on December 28th. This report advanced a plan for consideration, study, and constructive criticism by all interested individuals or organizations. The conference was then to convene again on Jan. 20, 1920, for the consideration of this criticism.

This second conference refrained from making any statement as to the causes of industrial unrest, but merely offered a tentative plan for preventing or retarding strikes and industrial conflicts by proposing Federal machinery for adjustment of differences between employers and employees. A firm stand was taken against the affiliation of policemen, firemen, or public safety government employees with any organization which authorizes the use of the strike as a weapon. The plan as worked out by the conference, provides for the establishment of a National Industrial Tribunal and Regional Boards of Inquiry and Adjustment. The National Industrial Tribunal was to consist of nine members to be appointed by the President and confirmed by the Senate, with headquarters in Washington, and would be solely an appellate tribunal, considering only disputes referred to it by the Regional Boards. The United States would be divided into regional districts similar to those of the Federal Reserve division, and there would be a Regional Board of Inquiry and Adjustment set up in each district. There would be an appointed Regional chairman. There are also regional panels of employers and employees, classified by industries. In case of dispute each side selects one representative, and the chairman selects two from each panel, making a board of seven members.

The report of the conference was signed by Wm. B. Wilson, chairman; Herbert Hoover, vice-chairman; Martin H. Glynn, Thomas W. Gregory, Richard Hooker, Stanley King, Samuel W. McCall, Henry M. Robinson, Julius Rosenwald, Oscar S. Straus, Henry C. Stuart, F. W. Taussig, William O. Thompson, Henry J. Waters, George W. Wickersham, and Owen D. Young.

CANADA. In April, 1919, a royal commission of eight members, representing the public, employers, and employees, was appointed to investigate and report as to the best means of establishing and maintaining the proper relations between the employers and the hand workers in Canada. This Commission, after an intensive investigation, offered the following recommendations: recognition of the right of workers to organize, recognition of unions, living wage, collective bargaining, extension of education, establishment of joint plant and industrial councils, and the holding of a conference of a more representative nature. Such an Industrial Conference was held September 15 to 20, and made a number of recommendations, but split on the subject of hours of work, and recognition of unions. However, there was an increase in mutual understanding, and the leaders of both sides felt that the conference was successful.

GREAT BRITAIN. Great Britain has been the leading nation in experimenting with different methods of bringing about satisfactory settlement of trade disputes. The government has organized a system of Trade Boards, consisting

of an equal number of employers and workers, and a few appointed members. These Boards have power to fix minimum rates and have general jurisdiction. There has been a most rapid spread of the system outlined in the Whitley Report, a commission appointed for this purpose, which establishes councils within each particular industry, to bring about further co-operation. This scheme consists in the formation of three different bodies,—in the first place, of National Councils, secondly, of District Councils, and thirdly, of Works Committees. By August 1, Joint Industrial Councils were formed in 43 major industries. This plan was applied to Government Civil Service on June 13th.

The method of procedure of the Whitley Councils is determined by the representatives of the organizations of employers and workers in each particular industry, who draft a constitution, stating the form, function, and objects of their council. In the constitution of some councils, it is provided that no strike, lockout or government arbitration shall be allowed to take place until the dispute has been considered by the council.

Although this plan had been so recently adopted that no statistics were available, it had already handled a number of difficult cases with satisfaction. The *Monthly Labor Review* stated that the small experience so far gained seemed to show that a better relationship between the employers and the workers was already resulting.

GERMANY. Before the revolution, the employers in Germany refused to recognize the trade unions as the legitimate representatives of labor, but pressure forced them to reverse their policy. As a result of negotiations in Berlin, 21 of the largest German employers' associations, and the seven trade unions and salaried employees federations, entered into joint agreement of principles to govern future industrial relations. The agreement covers: recognition of unions, denouncement of "yellow" trade unions, reinstatement of soldiers and sailors, joint administration of employment offices, collective bargaining, with establishment of arbitration boards, and the eight-hour day.

The agreement bears the signatures of the largest employers' associations, the Free, Hirsch-Duncker, and Christian Labor Unions, several salaried employees' organizations, and the personal signatures of a number of leading manufacturers and labor leaders.

NORWAY. On April 4th, a law enacted for the period of the war, and recognizing the principle of compulsory arbitration was reenacted to continue until Apr. 1, 1920. Under the law, an award by the Court of Arbitration has the binding effect of a judicial decision. Pending reference to arbitration, there may be no change unless agreed to by both parties. It is illegal to strike in order to determine the application or intent of the award. For infraction of reward, fines are assessed ranging from five crowns (\$1.34) to 25,000 crowns (\$6700).

The Court of Arbitration consists of a chairman and four members. The chairman and two members are appointed by the Crown. The National Federation of Trade Unions and the Norway Employers Association each appoint one other member. The usual court processes are observed by the court, witnesses being summoned and documents called for in the customary man-

ner. If requested by either party, the proceedings may be held behind closed doors.

ARCH. JOSEPH. British labor leader, died at Barford about the middle of February. He was born on Nov. 10, 1826, the son of a farm laborer, and was brought up as an ordinary peasant in Warwickshire, having but little education. He early became a man of influence among his fellow laborers for his intelligent efforts to benefit their conditions, and in the 1870's his reputation had spread throughout the country as an able champion of the cause of labor. The Warwickshire Agricultural Laborers' Union was founded in 1872 and he took part in the founding of the National Agricultural Laborers' Union to improve the general condition of the agricultural laborers throughout the kingdom. This became a great power and he was its real leader. From this time on he exerted a powerful influence in politics and had to be reckoned with at elections. He was a member of Parliament in 1885-86, 1892 and 1895-1900 he was elected to Parliament. He was not a Socialist and his demands had to do merely with the improvement of his class.

ARCHÆOLOGY. In 1919 systematic archaeological investigation had not yet been resumed, and what there was to report was merely the result of accidental discovery. It is interesting, however, to note that during the winter of 1919-20 an expedition from the University of Chicago, under the direction of Professor Breasted, was to spend much time in Egypt, and in the spring was to visit Beirut, Aleppo and then, after passing down the Tigris, to ascend the Euphrates and finally to arrive at Aleppo again. The purpose is to discover the possibilities for later archaeological investigation. In this connection it is worth noticing that airplane work during the campaign against the Turks has demonstrated that photographs taken from the air disclose buried ruins much the same as a submerged submarine is revealed under the surface of the water by aerial photographs. If this proves to be the case then the haphazard digging that has been indulged in at times can be given up.

Another indication of the resumption of archaeological investigation is the reopening of the American school in Jerusalem. That there is ample opportunity for exploration in this land is shown by the chance uncovering, by a Turkish shell, of a Mosaic at Ain Duk, near Jericho. The work belongs to the fourth or fifth century B.C., and mentions the name of Binyamin the Pharnas, son of Yoseh, who has apparently been a benefactor of the synagogue to which the Mosaic belongs. Besides this it goes on to urge others to give liberally.

In Crete, with the village of Malia, near Candia, the remains of an ancient palace have been uncovered. It belongs to the Minoan period. The bases of the columns show inscriptions and as well are decorated with ornaments of gold. Not far away were found tombs containing skeletons. There are indications that the finds mark the site of a town.

At Aquileia, which lies 22 miles northwest of Trieste, archæologists in the Italian army of occupation of Istria have found reliefs and Mosaics which apparently date from the early years of the first century of our era. These discoveries, taken in connection with other finds made during the war, show the district is the site of one of the oldest Roman settlements.

INDUSTRIAL LEADERS IN THE WASHINGTON CONFERENCE CALLED BY PRESIDENT WILSON

From left to right: G. H. Oyster, Harry A. Wheeler, T. C. Atkeson, Thomas L. Chadbourne, William G. Lee, Edwin Farnum Green, Bernard Baruch, John D. Rockefeller, Jr., Mathew Woll, W. D. Mahon

In northern Europe, in the island of Guernsey, a rudely sculptured human figure has been found cut on the under surface of one of the capstones of the central chamber of the dolman of Déhus, at Paradis in the Vole Parish. The work belongs to the neolithic age. In Scotland, on the estate of Mr. Balfour at East Lothian, a rich find of Roman silver vessels has been made. The objects were found on the hilltop of Trapram Laut about 20 miles east of Edinburgh, and had been crushed apparently with the intention of melting them down. The presence of Christian symbols and illustrations, together with Teutonic workmanship, has led to the suggestion that these vessels were brought by Frisian pirates, or robbers, to Scotland from some monastery which they had plundered on the continent. The discovery of a coin of the Emperor Valens dates the find in the fourth century.

ARCHITECTURE. The year 1919 did not see so extensive a resumption of building as had been anticipated by persons who were not familiar with conditions. During the early part of the year both labor and materials were almost as unavailable as during the war, when the necessary restrictions of conservation and concentration on essential industries brought virtually all building to a standstill. Even at the close of the year building conditions were found to be far from normal, for while materials and labor were both reasonably available, the cost of both was a deterring or prohibitive factor in many projects. While there is not, then, an extensive list of important buildings to present in this review, there are certain architectural notes of special interest to chronicle.

One of the most interesting of these is mention of the appointment by the American Institute of Architects of a "Post-War Committee," the purpose of which was to inquire into the building situation, and into the immediate prospects of the architectural profession. It is recorded that one of the findings of this committee stated that there was a bright future, a greater desire than ever before on the part of a large number of people for buildings of good architectural character, and that the standard of living among the working classes was constantly increasing.

Among other interesting acts of the American Institute of Architects was the proposal for an Inter-Professional Conference, to discuss the founding of a League of Professions (tentative title). Of direct interest to the profession of architecture was a resolution of the Post-War Committee to the effect that the American Institute of Architects would adopt a policy of non-interference with the architect's business methods, leaving any necessary regulation of this to state and local bodies.

The American Institute of Architects as a body showed consistent and constructive interest in the matter of housing problems throughout the period of the war. Other important proposals made by the institute at this time were for a Government Department of Public Works and a Government Bureau of Fine Arts.

A mission from the office des Batiments, of France, visiting this country for the purpose of studying American building methods and materials, suggested to the institute a proposal for a Franco-American Architectural Affiliation.

In addition to the investigations of housing

problems carried on by the American Institute of Architecture, many architectural firms and individuals devoted their entire time to planning housing developments, and the government authorized the U. S. Housing Corporation to exercise as much supervision as possible over all housing developments throughout the country. The sudden and unprecedented expansion of many war industries called for much quick and intelligent work on the part of our architects to meet the resulting housing problems.

Owing to the suspension of all private non-essential building projects during the war, and to the abnormally high prices of labor and material, the close of 1919 saw an almost unrelieved shortage of houses and apartments. In New York alone it has been estimated that the close of 1919 would see a shortage of 35,000 apartments.

During the war the attendance at all the architectural schools was greatly depleted, and many draftsmen from architectural offices throughout the country were also in the army. As a part of the A. E. F. University of Beaune, Côte d' Or, France, a Department of Architecture was organized, and Mr. Lloyd Warren headed another at Bellevue. Thirteen hundred men in all were given instruction in art or architecture, and there were 1700 applicants when the schools were closed. Apart from its interest as an added achievement of the A. E. F. staff, the architectural studies pursued by our men in France offer a valuable suggestion to the architectural schools at home. An important part of the work took the form of "Field Trips," in which the men went out to study actual buildings. There is too much work on paper and not enough familiarity with actual buildings in our architectural schools, and it is indeed a poor locality which would fail to afford some material worthy of study in "Field Trips."

MEMORIAL BUILDINGS. Perhaps the most important immediate architectural by-product of the war is the War Memorial, which is now engaging the interest and attention of many architects and many communities. The *Architectural Record* (issue of September, 1919), published, in addition to an article on the subject, a thorough and extensive bibliography on the subject of War Memorials, compiled by Mr. Frank Weitenkampf, of the New York Public Library.

If we recall the great number of distressingly un-architectural memorials which followed the Civil War, it is to be hoped that due time and deliberation be given to the design of permanent memorials. It is reported that the French, fully aware of the danger of precipitancy, have passed a law forbidding the erection of any War Memorials for a period of 10 years.

One of the most important of the temporary memorials was the triumphal arch on Fifth Ave., at Madison Square, in the design of which the firm of Carrère & Hastings played a considerable part.

There are, broadly speaking, two types of Memorial Buildings:—the "purely monumental, which shall commemorate idealistically in terms of art the qualities of character and mind called forth by the great war, and the more utilitarian memorial in which the idea of service is pre-eminently taking the form of buildings for special uses, or for the uses of social service or civic nature."

It has been found that most of the suggestions for memorials come under one or the other of these two.

Early in January, 1919, the American Federation of Arts issued a circular letter of advice and suggestion directed to all or any who might be contemplating the erection of War Memorials. A second circular was subsequently issued, announcing the formation of a general committee, to act in an advisory capacity to individuals or committees projecting any kind of War Memorials. Personal contact was effected by Regional Sub-Committees, working under instructions from the General Committee. These circulars define the character of memorials, and go on to suggest various types of memorials other than conventional monuments, as follows: community and neighborhood houses, village greens, stained glass windows, medals and tablets.

Another pamphlet upon this same subject was prepared and issued by the Municipal Art Society of New York City. Numerous illustrations show existing memorials, and the points brought out should prove most helpful to any layman or lay committee interested in the erection of a War Memorial.

Not only the design of the memorial, but the selection of site concerns the architect and the public, and Mr. H. A. Caparn addressed the American Society of Landscape Architecture to the effect that every effort should be made to discourage the location or encroachment of Memorial Buildings in public parks.

Among the New York suggestions for a project to commemorate the deeds of the A. E. F. was that of a broad Memorial Plaza in front of the Grand Central Terminal.

According to the *Home Sector* (the magazine of the demobilized army), 12 states have announced plans for memorial buildings, of which most will be located near the several State Houses.

The following list gives not only the states which plan the memorials, but an idea also of the forms the several buildings are to assume.

Alabama—A building of Alabama marble will be erected near the State capitol at Montgomery at a cost of not less than \$500,000. It will be used as a State historical building and museum of the records and trophies of the European war.

Delaware—An auditorium and armory will be erected by the State to cost \$500,000.

Illinois—Work has been started on the foundation of the Illinois memorial building, which is to adjoin the State House at Springfield. The State will build a museum also.

Iowa—The State Legislature has voted to erect a Temple of Justice on the capitol grounds at Des Moines as a memorial to soldiers, sailors and marines, the building to cost \$1,000,000.

Minnesota—A majority report by the Memorial Commission of Minnesota favors a memorial on the State university grounds at Minneapolis.

Mississippi—A drive to raise \$500,000 for a memorial building is now under way.

New Jersey—A \$250,000 memorial building, in the form of an auditorium, is to be erected on the State House grounds at Trenton. The building will have a niche for each of the 21 counties of the State, and each niche will contain trophies and data.

North Carolina.—Governor Bickett has named nine members of a memorial commission which

will have charge of the erection of a building at Raleigh.

North Dakota—A \$200,000 memorial building will be erected on the State capitol grounds at Bismarck.

South Carolina—A \$500,000 memorial building in honor of the State's white soldiers will be erected at Columbia on the grounds of the State University, the State furnishing \$100,000 toward the fund. The State is also furnishing \$100,000 toward the erection at Orangeburg of a memorial building for colored soldiers.

South Dakota—The people of the State are subscribing \$583,000 for the erection of a memorial building on the capitol grounds at Pierre.

Tennessee—The Legislature has appropriated \$1,200,000 for the erection of a memorial building in the form of a large auditorium.

The Memorial preference in the West and Middle West seems to be tending toward beautiful city plans. In the case of monuments it is to be hoped that some check upon ill-considered design and too-speedy erection will be possible. England has its "Selection Committee of the War Memorial Exhibition," and France proposes an enforced 10-year wait before any War Memorials be built.

Two typically American buildings are found, also, to be thought of as possible War Memorials: the "Neighborhood Club" and the Municipal Auditorium. An example of the Municipal Auditorium is seen at Springfield, Mass., where it has been for some years a distinct civic asset and a source of legitimate civic pride. A similar building has been completed within the year (though not as a memorial), at Savannah, Ga. (Henrik Wallin, architect.)

The central Y. W. C. A. in Minneapolis, Minn., has erected a large new building (Long & Lamoreuse, architects). It is interestingly handled in a modified Gothic style, with mansard roof, not unlike much work of the French Renaissance. Its mass and general architectural qualities make it a distinctly successful building.

In California the architects are remarkably progressive, and building has been a little more brisk than in the East. Schools, hospitals, institutional buildings, armories and the like are being designed in an essentially modern manner, based on the indigenous mission style. Among a large group of public and semi-public buildings, designed by George B. McDougall, the State Architect, working under the California State Bureau of Architecture, the buildings for the State Normal School seem particularly good. It may be that State direction of public building projects, if intelligently administered, and kept free of politics, produces good results.

Schools in general seem to be following the admirable type successfully developed by W. B. Ittner, of St. Louis, Mo. (and discussed at more length in *THE INTERNATIONAL YEAR BOOK* of 1916). Two typical recent school buildings: the High School, Butler, Pa. (W. G. Sickles, architect), and the Colfax school, Pittsburgh, Pa. (Edward Stotz, architect), evidence this now seemingly prevalent adherence to type.

In a free rendering of Italian style are the Oberlin College Administration Building (Cass Gilbert, architect), an interesting building with Byzantine detail, and Hilgard Hall, University of California (John Goler Howard, architect). This building is strikingly detailed in a free Classic Renaissance, with unusually well-studied

sgraffito decorations in frieze, pilasters, jambs and soffits.

The new dormitories for Wellesley College—(Coolidge & Carlson, architects), are important additions to the constantly growing quota of good scholastic architecture in this country.

While this summary does not intend to constitute a comprehensive list of important or meritorious buildings projected or completed during the past year, it will endeavor to mention some of the more conspicuous ones. It has not been a prolific year in building.

Among libraries and museums, Chicago shows, perhaps, the most important in the great Field Museum of Natural History (Graham, Anderson, Probst, and White). It is a vast structure, with the conventional pediments, colonnades and end pavilions.

The Waltham Public Library, Waltham, Mass. (J. D. Leland and C. G. Loring, associated architects), is an admirable rendering of the Georgian style, modified and adapted for modern use—a fine general type which might well be followed by the architects of small public buildings in general throughout the East.

At Plainfield, N. J., this Georgian feeling, with a marked blending of the Italian, is the motive for the Municipal Building (Lawrence F. Peck and Wm. L. Bottomley, associated, architects). For the relatively small public building in a suburban or rural community, no other style so effectively combined dignity and general suitability.

Another official building, the postoffice and courthouse, New Haven, Conn. (James Gamble Rogers, architect), is a far more conventional affair, with classic pediment and colonnaded portico, the whole admirably set off by its location at one side of a park.

In the field of church architecture, two important churches in New York City have been completed by Bertram G. Goodhue (formerly of the firm of Cram, Goodhue, & Ferguson). One of these is the Church of St. Vincent Ferrer, the other a new building for St. Bartholomew's Church, in which Mr. Goodhue incorporated the famous portion of the Romanesque entrance façade by Stanford White, removed from the old building.

The Romanesque style is seen again in the Finney Memorial Chapel at Oberlin College (Cass Gilbert, architect). The design of small churches is constantly improving, as is evidenced by the rugged Gothic feeling in the Washington Memorial Chapel at Valley Forge, Pa. (Zant-zinger, Borie, & Medary, architects), and in the delightfully picturesque quality of "The Church in the Garden," at Forest Hills Gardens, L. I. (Grosvenor Atterbury, architect).

Commercial buildings represent a division of architecture in which building has been comparatively brisk, and, in many cases, carried on during the war. This war-time commercial architecture was mostly confined to the factory buildings of those plants which were engaged in industries essential to the war, whether entirely new enterprises or necessary enlargements of existing ones. Such buildings were favored by the federal priority orders on materials, and by reason of the importance and profit of their work, able to pay abnormal prices for labor. Few of these war-time factories, and post-war factories made any pretensions to architectural character, and the writer has noted, among other

factory buildings, but few of relatively imaginative design. Conspicuous among these are the manufacturing building for A. B. Dick Co., Chicago, Ill. (S. N. Crowen, architect), and the Burroughs Adding Machine plant, and the Lozier Motor Co., both in Detroit, Mich. (Albert Kahn, architect). The same architect is also the designer of a distinctly architectural storage warehouse for the Detroit *News*, a building of the utmost severity, but well-handled masses.

An unusually beautiful office building is that of the Walter Baker Co., Ltd., Dorchester, Mass. (George F. Shepard, architect). The style is a beautifully and skillfully modified Georgian.

By far the most important office building, not yet completed, is the new Cunard Building, at Broadway, Morris and Greenwich avenues, New York City (Benjamin Wistar Morris and Carrere & Hastings, architects). This building will be 21 stories high, and will cost approximately \$10,000,000.

Another large office building is the National Association building.

The most important bank building of the year past, and not now completed, is the Federal Reserve Bank (York & Sawyer, architects), a vast Italian Renaissance edifice, with all the refinements characteristic of the bank buildings designed by this firm.

Within a period of six months, during the past year, it is stated that 189 new banks were granted charters, and 24 others authorized to increase their capital—a condition which forecasts considerable activity in this type of building this year.

Among notable banks of the past year are: The Boatmen's Bank Building, St. Louis, Mo. (Eames & Young, architects); The Beneficial Savings Fund Building, Philadelphia, Pa. (Horace Trumbauer, architect), and the Trenton Banking Co., Trenton, N. J. (Dennison & Hiron, architects). In the last named are apparent many of the refinements now coming to be an accepted part of the modern bank building—well-studied detail, fine bronze grills and doors, and a ladies' banking room, with Heppelwhite furniture and other decorative accessories of the period, as finely carried out as in a smart hotel.

The most interesting club recently completed is the Cosmopolitan Club, New York City (Edward C. Dean, architect), an unusually picturesque building in both plan and detail. The plan comprises a flagged courtyard, with a cloistered walk, and the entire treatment is one of distinct charm.

Two of the most conspicuous buildings of the past year are the two gigantic New York hotels, the Commodore and the Pennsylvania. The Commodore (Warren & Wetmore, architects), is divided by two light courts into three great towers. The architectural styles of this complex building are too varied and unrelated to admit of discussion in this article. The Pennsylvania (McKim, Mead, & White, architects), faces the great Pennsylvania Railroad terminal, and is a far more dignified building than the Commodore, being carried out in a monumental rendering of the Italian Renaissance style.

Two other considerable hotels, the Hotel Cleveland, Cleveland, Ohio (Graham, Anderson, Probst, & White, architects), and the Hotel Fort Des Moines, Des Moines, Ia. (Proudfoot, Bird, & Rawson, architects), both indicate to what a widespread extent the treatment of the

modern hotel has been influenced by the great New York hotels designed by Warren & Wetmore, of New York.

The most notable railroad station of the past year is the Union Passenger Station at Richmond, Va. (John Russell Pope, architect). It is an essentially dignified building, with a central colonnade feature and a flat dome, much in the manner of the Columbia University Library in New York City.

Mention should be made of several very charmingly designed small country railroad stations by Frank J. Forster, an able country-house architect. If country-house architects were more often engaged to design country railroad stations there would be a happier conformity with the houses nearby, as in the case of Forest Hills Gardens, L. I., where Grosvenor Atterbury, the architect of most of the houses, also designed the station.

In the division of Residential Architecture (see page 47, *THE INTERNATIONAL YEAR BOOK*, 1916), the labor and materials situation has greatly restricted the output for the past three years.

Many houses, of course, have been built—for the most part, houses of the large and expensive class. The cessation of building small houses has resulted in an acute shortage, further aggravated by the corresponding cessation of apartment house building, the latter, as an investment, usually being built on an economy basis.

There is also a type of apartment house in which economy is not an essential factor, a type largely confined to Park Avenue, in New York City, in a section where sumptuous apartment houses are the rule. Building of these expensive apartments again shows considerable activity, which will also begin to be apparent in the construction of the more common type, to relieve the present housing situation.

Indicative, too, of the general resumption of large building projects, which promise interesting material for review in the coming year, mention should be made of the \$20,000,000 group of hotels now commenced at Atlantic City, N. J. The principal hotel included in this project will be another Ritz Carlton hotel, part of the famous group under that name, and will be a building of 15 stories, Georgian in design, with a red brick exterior, and trim in white limestone and terra cotta. This building alone will cost \$4,500,000, and in conjunction with the nearby Hotel Ambassador, with arcades, shops, California bungalows, and gardens, will form part of one of the most extensive hotel developments in this country.

EUROPEAN ARCHITECTURE. From Europe we have yet to receive complete and authoritative advices upon the architectural situation as a whole, though interesting items of news come through from time to time.

In midsummer, 1919, the housing situation was still acute, notwithstanding the wide interest taken in housing developments. Garden cities have long been a part of English domestic policies, but with the cost of building (due to shortage of labor and materials), more than 100 per cent in excess of pre-war cost, building has not been brisk. As an indication of the wide popular interest of the English in this question of housing we find the *Daily Express* promoting a "Workers' Home Competition" for de-

signs and housing plans, with a first prize of £100.

English architects, meanwhile, have taken up many interesting questions relative to the progress of their profession. Among these is the plan for helping draftsmen who have been demobilized. There is also a movement toward organizing the British building industries along more practical and up to date lines.

In both England and Canada there has been, and is extensive government financing of homesteads for returned wounded soldiers. Owing to the shortage of both labor and materials in England there has been considerable controversy over the question of utilizing ready-made wooden houses, to be brought over from Canada and the United States. The promoters in favor are manufacturers of this type of house, both here and in Canada, while former habits and traditions combine to form an active opposition in England.

In a paper on "Reconstruction in the Profession" (English), one architect stresses the importance of educating the public to a better appreciation of architecture, and of the problems and difficulties encountered by the architect of to-day.

The salaried draftsmen (assistants) of the English architect, are, like so many other groups in these unsettled times, disinclined to return to pre-war working conditions. Their pay has been increased by 50 per cent, and they have launched, provisionally, an "Architectural Assistants' Professional Union." It should not be supposed from this, however, that there is any lack of harmony as between the architects and draftsmen, for the Architectural Association of England expresses a desire to help the demobilized draftsman and student who "laid down his T-square for a rifle," and has appointed an "Architectural Demobilization Committee," with the idea of providing all possible aid.

English architectural journals of the early part of the year past seemed in agreement that the much needed and hoped for boom in building would not take place for at least 12 months—from which we are to infer that 1919 has seen the architectural profession in England struggling to "find itself," and devoting considerable thought and effort to the task of effecting various constructive compromises with the new era of new and unaccustomed conditions and demands.

France is rebuilding rapidly. Many of the ruined cities have floated considerable bond issues in this country, and private enterprise and generosity, both here and in France, has given extensive aid.

Long before the cessation of hostilities on Nov. 11, 1918, the French government had put architects at work preparing plans for the immediate reconstruction of the devastated towns and villages. For this purpose calls were sent out for the loan or donation of all sketches, photographs or paintings of the original buildings, so that the architects might re-design as nearly as possible in the picturesque manner of the old buildings. By way of aiding the whole work of reconstruction the Ministry of Liberated Regions prepared a bulletin designed to act as a guide to all who might express philanthropic desires to help the reconstruction work.

French reconstruction work is divided into two classes: (1) The most urgent work (some-

© Underwood & Underwood

HOTEL COMMODORE
Near Grand Central Station, New York City

times only for temporary use), and largely performed by 200,000 German prisoners, and (2) the permanent work, which will, of course, proceed far more slowly.

Corresponding with the Architectural Demobilization Committee of the Architectural Association of England, the French established a clearing house for architects and draftsmen, in order to assure them positions as soon as possible. There is, of course, a vast amount of architectural work involved in even a partial restoration of the portions of France which were laid waste by the invading armies.

At Montevideo, Uruguay, there will be held (March 1, 1920), the first Pan-American congress of architects ever called together.

ARCTIC. See POLAR RESEARCH.

ARGENTINA. A republic in southern part of South America on the eastern coast. Capital, Buenos Aires.

POPULATION. There are 14 provinces, 10 territories and one federal district with a total area estimated variously, the commonly accepted one being 1,153,119 square miles. The population according to the census of 1914 was 7,885,237 as compared with 4,405,000 in 1895, and the density per square mile was 6.83. The total population on Jan. 1, 1918, was given at 8,284,266. It was distributed among the provinces and other divisions as follows:

Buenos Aires	1,615,223
<i>Provinces</i>	
Buenos Aires (La Plata)	2,190,876
Santa Fé	947,804
Córdoba	766,875
Entre Ríos (Parana)	444,991
Corrientes	357,026
San Luis	124,387
Santiago del Estero	285,681
Tucumán	354,545
Mendoza	298,225
San Juan	127,775
La Rioja	83,146
Catamarca	106,500
Salta	147,537
Jujuy	77,990
<i>Territories</i>	
Misiones (Posadas)	57,544
Formosa	20,399
Chaco (Resistencia)	48,599
Pampa Central (General Acha)	111,887
Neuquén (Chos Malal)	30,474
Rio Negro (Viedma)	44,968
Chubut (Rawson)	25,838
Santa Cruz (Gallegos)	10,882
Tierra del Fuego (Ushuaia)	2,527
Los Andes (San Antonio de Los Cobres)	2,572
Total	8,284,266

On Jan. 1, 1919 the population was estimated at 8,411,000. The capital and largest city is Buenos Aires whose population on June 1, 1914, was 1,575,814; and on Sept. 1, 1918, was estimated at 1,637,155. The second city is Rosario with a population estimated in 1918 of 235,000. Other large cities with recent estimates of population are: Córdoba, 135,000; La Plata, 119,000; Avellaneda, 105,000; Tucumán, 100,000; Santa Fé, 60,000; Mendoza, 62,000; Bahía Blanca, 75,000; Parana, 36,000; Salta, 33,000. From 1857 to 1917 the number of immigrants by sea was over 4,762,067 of whom 2,296,834 were Italians, 1,527,115 Spaniards, 226,481 French, 136,646 Russians, 121,513 Turks and Syrians, 81,290 Austrians, 62,496 Germans, 57,243 Britains, and 33,499 Swiss. In the year

1917 the immigrants numbered 51,665 and the emigrants 83,996. From 1914 down to the end of 1918 there was each year a considerable excess of emigration over immigration, the total immigration during that period was 272,568 and the total emigration, 482,431, or a loss of 209,753.

EDUCATION. Public elementary education is free, and subsidized by provincial and general governments. It is secular and nominally compulsory between the ages of six and 14. In 1917 the primary schools numbered 8453 public, with 1,041,131 pupils and 31,238 teachers; primary private, 1002 with 77,080 pupils and 3483 teachers. Secondary education is controlled by the general government which maintains 37 national colleges with between 11,000 and 12,000 pupils and 1246 teachers; there are also 33 private institutions of the same grade with about 3000 students and 398 teachers. Besides these there are 78 normal schools (13,431 pupils); 41 schools for special instruction (11,559 pupils); and five universities of which three are national, namely, those at Buenos Aires (10,230 students); La Plata (2910 students); and Córdoba (840 students); and two provincial, namely, Santa Fé and Tucumán. The above figures are for 1917. There are national observatories at Córdoba and La Plata, and museums at Buenos Aires and La Plata. The budget for education in 1918 was 29,199,608 paper dollars for primary education, 5,468,744 for secondary; 5,039,756 for technical and commercial education; 9,689,660 for normal schools; 6,811,780 for university education; total, including miscellaneous items, 57,626,228. Educational statistics for the year 1918 were as follows: Secondary, normal and special schools included 36 national colleges, 1 lyceum for girls, 77 normal schools, 7 commercial schools, 4 industrial schools, 3 schools of arts and crafts, 1 grammar school, 1 teachers' institute, 1 school of modern languages, etc., giving a total of 152 with an enrollment of 67,631 and with 5169 teachers. There are also 51 private schools with a registration of 5110.

PRODUCTION. The chief sources of wealth are agriculture and stock-raising. The area for agricultural and pastoral use has been placed at 253,195,000 acres and it has been estimated that about 10,000,000 acres of the cultivable portion require irrigation. The following table shows the acreage of the leading crops and the production in tons for 1917-18, and 1918-19:

	<i>Acreage</i>		<i>Produce (Tons)</i>	
	1917-18	1918-19	1917-18	1918-19
Wheat ..	17,864,412	17,175,000	5,973,000	5,015,000
Oats	3,200,002	3,015,000	1,100,000	840,000
Flax	233,606	8,456,625	568,000	705,000
Maize	4,335,000

A message of the president to congress asking that a stock census be taken showed that the livestock on hand in the Argentine Republic was less than in 1914, owing to increased exports of meat-producing animals, which in 1918 rose to 2,977,000 head of cattle and 2,145,000 head of sheep.

COMMERCE. The following account of foreign commerce during the year 1918 is given by the *Bulletin* of the Pan American Union on the basis of official figures: Cash value of foreign com-

merce, 1,307,392,000 pesos gold, distributed as follows: Imports, 480,896,000, and exports, 826,496,000; balance in favor of Argentina, 345,600,000 pesos gold. The figures vary widely from those of previous years. The exports of 1918 exceeded those of any former year, both in bulk and value, surpassing the highest value previously recorded by 244,000,000 pesos gold, since, in 1915 the value of the total export was 582,179,000 pesos gold. However, the quantity of articles imported in 1918 was less than any year of the past 15, representing a sum equal or slightly greater, in proportion to the population, than that recorded 15 or 20 years before and something over one-third that of the year of greatest importations. Indeed, the commercial balance in favor of the Republic was the highest yet attained, exceeding any previous record by 68,900,000, as in 1915, hitherto the highest, the balance totaled only 276,600,000 pesos gold.

The value, in gold pesos, of the import and export trade of Argentina with each country during 1918 (the Argentine gold peso is valued at \$0.9648) was as follows:

Countries	Imports from (Pesos)	Exports to (Pesos)
United Kingdom	125,000,000	305,800,000
United States	169,500,000	165,100,000
France	26,000,000	113,000,000
Brazil	49,400,000	33,800,000
Spain	41,800,000	23,800,000
Italy	20,000,000	40,200,000
Uruguay	4,500,000	15,000,000
Japan	15,200,000	2,800,000
Chile	8,300,000	8,600,000
Paraguay	7,300,000	5,200,000
Sweden	8,300,000	4,400,000
South Africa	1,900,000	4,900,000
Mexico	5,350,000	50,000
Norway	900,000	4,200,000
Peru	4,000,000	300,000
Cuba	3,200,000	300,000
Switzerland	3,200,000	20,000
Other countries and "or- ders"	11,750,000	74,430,000
Total	500,600,000	801,400,000

There was a large increase in the exports to the United Kingdom during last year, compared with 1917, due largely to shipments of wheat under the wheat convention, etc. The export of grain products in tons for 1917 was as follows:

Wheat, 935,828; flour, 112,465; linseed, 141,308; corn, 893,932; oats, 271,713. In 1918 they were as follows: Wheat, 2,943,313 tons; flour, 97,241 tons; linseed, 391,708 tons; corn, 622,427 tons; oats, 517,038 tons. During the last 20 years the agricultural and stock production of the republic has greatly increased. In the five years from 1899 to 1903 the exports of agricultural and stock products amounted to 878,000,000 Argentine gold pesos, as compared with 1,493,000,000 gold pesos in 1904-1908, 2,074,000,000 gold pesos in 1909-1913, and 2,766,000,000 gold pesos in 1914-1918. The exports during the first five years referred to aggregated 387,000,000 gold pesos of agricultural products and 491,000,000 gold pesos of stock products. These exports during the second five-year period were 884,000,000 gold pesos of agricultural products and 609,000,000 gold pesos of stock products; during the third period they were 1,147,000,000 gold pesos of agricultural products and 927,000,000 gold pesos of stock products; and during the fourth five-year period they rose to 1,160,000,000 gold pesos of agricultural products and 1,606,000,000 gold pesos of stock products. Argentina is one of the largest exporting countries of meat products in the world. In 1917 the exports in tons were as follows: Frozen meats, 410,455; chilled meats, 38,995; preserved meats, 142,153; other meats, 7613; total, 559,216. The total for the first six months of 1918 was 339,463. In recent years there has been a great increase in the exportation of cheese products. From being an importing country in cheese Argentina in 1917 exported 2,728,393 kilos and imported only 312,690 kilos; and during the first three months of 1918 the change was even more marked, namely, exports of cheese, 1,633,362 and imports, 8007. The butter exports rose from 3,784,396 in 1913, to 9,830,154 in 1917, and in 1918 from the ports of Buenos Aires and La Plata alone, 12,159,823.

FINANCE. The unit of currency is the peso or dollar (gold) with a value of five francs or 96.475 cts., but the money in circulation is chiefly paper pesos which have a value fixed by the conversion law of 1899 at 44 per cent of the gold peso or 42.449 cts. in American money. The totals of the budget for 1918 are as follows:

Revenue	Dollars Paper	Expenditure	Dollars Paper
Ordinary:—		Ordinary:—	
Import duties	150,050,000	Congress	4,598,156
Alcohol	8,000,000	Ministry of Interior	46,764,814
Tobacco	30,700,600	Ministry of Foreign Affairs and Worship	4,258,759
Licenses	4,800,000	Ministry of Treasury	19,549,262
Stamped paper	20,000,000	Ministry of Public Debt	126,445,894
Posts and Telegraphs	16,500,000	Ministry of Justice and Education	70,531,174
Service of debt from various provinces	3,752,564	Ministry of Army	29,119,337
Perfumery and patent medicines	2,903,875	Ministry of Navy	22,779,675
Land tax	6,500,000	Ministry of Agriculture	9,206,520
Port dues	14,800,000	Ministry of Public Works	10,426,015
Export tax	66,700,000	Pensions, etc.	16,821,473
Alcoholic beverages	8,000,000	Public works	19,395,000
Tax on horse races	2,000,000		
Sanitary works	5,997,893		
Beer tax	8,600,000		
Tax on matches	3,400,000		
Tax on insurance	1,000,000		
Tax on wine	1,500,000		
Sale of fiscal land	1,500,000		
Miscellaneous	10,712,123		
Total ordinary	362,416,455	Total ordinary	379,896,079
Special revenue for subsidies, charities, etc., derived from the national lottery	10,799,986	Subsidies	11,093,401
Perfumes tax fund	196,125		
Grand total	873,412,806	Grand total	390,989,480

The revised figures for the expense budget of 1918 were as follows: Total, 391,035,571 pesos, currency, made up as follows: Congress, 4,598,156; department of interior, 46,764,812; foreign relations, 4,304,850; treasury, 19,549,262; public debt, 126,445,894; justice, 12,904,946; public instruction, 57,626,228; war, 29,119,338; navy, 22,779,676; agriculture, 9,208,520; public works, 10,426,015; pensions, 16,821,473; public instruction, 19,395,000; subsidies, 11,093,401. The gold store of Argentina during the war was increased about 50 per cent. According to the estimates of the conversion office the amount in 1913 was 294,934,755 pesos, whereas in 1918 it was 436,000,000 pesos.

COMMUNICATIONS. In 1917 the vessels entered at all Argentine ports numbered 44,345 with a tonnage of 16,428,586 and those cleared 44,088 with a tonnage of 16,446,837. The rail-ways open to traffic on Jan. 1, 1918 had a mileage of 21,858 of which 3798 (18 per cent) belonged to the state. The post offices at the beginning of 1918 numbered 3461 and the telegraph lines in 1915 had a mileage of 43,153 of which the national telegraph lines had 23,978.

ARMY AND NAVY. Service is compulsory in the national militia for all citizens from their twentieth to their forty-fifth year, who must pass the first 10 years in the active army or first line, then 10 years in the National Guard and finally five years in the Territorial Guard. The country is divided into five military districts, each of which supplies a division of the first line and also a reserved division. The active strength of each division was placed at 20,000 men. The reserve numbered about 250,000. The navy included the 2 large dreadnoughts *Moreno* and *Rivadavia* of 27,940 tons each; 4 armored cruisers, of 6840 tons each; 2 pre-dreadnoughts of 2336 each; and 2 protected cruisers, of 3500 and 4500 respectively; besides that, several small gunboats and torpedo gunboats, 7 destroyers, 8 torpedo boats and various training-miscellaneous craft. The personnel varied from 5000 to 6000 men. The army budget for 1918 was £2,562,502 and the navy budget £2,004,611.

GOVERNMENT. The form of government is that of a federal republic. Executive power is vested in a president for six years by electors from the 14 provinces and he is ineligible for reelection. He is responsible with his ministry for the executive acts. It is required that both president and vice-president shall be Argentines by birth and Roman Catholics in religion. The cabinet or ministry consists of eight members, namely: Secretaries of interior, foreign affairs, war, marine, finance, justice and public instruction, agriculture, and public works. Legislative authority is vested in a Congress of two houses, the Senate and the House of Deputies, the former having 30 members, that is, two from each province and the federal districts, elected for nine years, and the latter having 120 members, elected by the people. According to the constitution, there should be one deputy for every 33,000 inhabitants. The term of the deputies is four years, but one-half of the House must retire every two years and one-third of the Senate is renewed every three years. The president at the beginning of 1919 was Señor Hipolito Irogoyen, who was inaugurated Oct. 12, 1916, and the vice-president was Dr. Pelagio Luna.

HISTORY. At the beginning of the year a strike at the port of Buenos Aires of a serious nature was declared (January 7th), and it was reported that during the week before the iron-work strikers had established a reign of terror, entrenching themselves and attacking the workmen and the police. The employers were organized solidly against it and determined to crush it out. On the other hand the strikers were firm and the struggle threatened to be desperate. On January 11th it was announced that General Dellepiane had assumed a military dictatorship in the city. Throughout the day there were collisions between the strikers and the police, and it was reported that 72 persons were killed, 87 seriously wounded, and 800 slightly wounded. The strike now spread throughout the country. On January 12th it was reported that the general strike had ended, though there were still riotous movements in the streets. There was repeated talk of Bolshevik influence in these disorders, and on January 13th Pedro Wald, the so-called President of the Federal Republic of Argentine Soviets, was arrested along with other ring leaders. The strike had spread to Montevideo, but precautionary measures were taken against it and serious trouble was averted. The Department of Labor reported that during the first half of the year 1919 there were 259 strikes involving 262,319 workmen. Early in the year it was reported that German propaganda was active in the country, and that it was directed toward establishing friendly relations between Argentina and Germany. The Germans appeared to fear the possibility that their property would be taxed in connection with the indemnity demands. There was no proof that the local concerns in Argentina had any connection with the head office in Germany, but it was suspected that measures had been taken to disguise this connection.

ARIZONA. POPULATION. The population in 1910 was 204,354, and on July 1, 1919, it was estimated to be 280,280.

AGRICULTURE. The following table is compiled from a report of the Federal Department of Agriculture.

Crop	Year	Acreage	Produc. Bu.	Value
Corn	1919	39,000	1,287,000	\$2,574,000
	1918	34,000	952,000	1,999,000
Oats	1919	13,000	533,000	533,000
	1918	11,000	440,000	528,000
Barley	1919	29,000	1,102,000	1,543,000
	1918	30,000	1,020,000	1,326,000
Wheat	1919	43,000	1,204,000	2,709,000
	1918	38,000	988,000	2,371,000
Hay	1919	169,000	a 676,000	13,520,000
	1918	150,000	a 480,000	11,520,000
Cotton	1919	116,000	b 75,000	19,125,000
	1918	95,000	b 56,000	13,345,000

a Tons. b Bales.

TRANSPORTATION. In the year 1919 four companies constructed a total of 32.4 miles of new first track.

EDUCATION. The school population in the State between 6 and 21 years, is 77,777; the enrollment in the public schools in 1919 was as follows: in the grammar schools, 63,470; in the high schools, 4503. The daily attendance for the grammar schools was 38,139, while that of the high schools was 3220. There were 309 teachers in the high schools, 195 in the university and normal schools, and 1702 teachers in the public schools. The average salary per

month of teachers was as follows: for the grammar schools, male, \$135.13, female, \$98.95; for high schools, male, \$162.71, female, \$123.10. The total expense for educational purposes was \$2,973,339; of this \$2,364,931 was for the lower schools, and \$608,408 for the high schools.

FINANCE. According to the report of the Treasurer for the year ending June 30, 1919, the total receipts were \$7,089,715, and the disbursements amounted to \$5,760,454. The balance at the beginning of the year was \$1,832,576, and at the end of the year it was \$1,329,260. The bonded State indebtedness on Dec. 22, 1919, was \$869,972; the total bonded indebtedness of the State including the county and city indebtedness was on July 30, 1919, \$2,996,275.

STATE OFFICERS. Governor, Thomas E. Campbell; Secretary of State, Mit Simms; Auditor, Jesse L. Boyce; Treasurer, Harry S. Ross; Attorney-General, Wiley E. Jones; Superintendent of Public Instruction, C. O. Case; Legislative Reference Librarian, Con. P. Cronin.

JUDICIARY. Supreme Court: D. L. Cunningham, Chief Justice; Henry D. Ross, and A. C. Baker, Associate Justices; Clerk, C. F. Leonard. See **CHILD LABOR**; **MINERAL PRODUCTION**.

ARIZONA, UNIVERSITY OF. A co-educational State institution, at Tucson, Ariz. The enrollment for the summer session of 1919 was 78, while for the fall it was 968, of which 331 were women and 637 men. The faculty numbers 90. Productive funds of the University amount to \$10,500, while the income for the year was \$700,000. The library contains 32,000 volumes. During the year a women's dormitory and the Steward Observatory were constructed. One hundred and sixty students are being trained in the University under the provisions of the Federal Board for Vocational Education. The institution includes Colleges of Letters, Arts and Sciences, Mines and Engineering, and Agriculture. The University was founded in 1885. President, Rufus Bernhard von Kleinsmid, M.S., Ph.D.

ARKANSAS. POPULATION. The population of the State in 1910 was 1,574,449, and on July 1, 1919, it was estimated to be 1,819,587, a gain of 26,000 during the year.

AGRICULTURE. The following table is prepared from an estimate of the Federal Department of Agriculture.

Crop	Year	Acreage	Produc.	Bu.	Value
Corn	1919	2,707,000	48,726,000		\$79,911,000
	1918	2,700,000	35,100,000		63,180,000
	1919	420,000	9,240,000		8,131,000
Oats	1918	390,000	9,945,000		8,752,000
	1919	340,000	3,230,000		6,525,000
Wheat	1918	254,000	8,048,000		6,309,000
	1919	158,000	6,162,000		14,789,000
Rice	1918	170,000	6,443,000		11,597,000
	1919	550,000	a 770,000		15,785,000
Hay	1918	467,000	a 607,000		11,836,000
	1919	2,563,000	b 830,000		151,060,000
Cotton	1918	2,991,000	b 987,000		137,240,000
	1919	41,000	3,321,000		6,808,000
Potatoes	1918	48,000	2,400,000		4,416,000
	1919	46,000	4,600,000		5,290,000
Sweet potatoes	1918	38,000	3,420,000		4,720,000

a Tons. b Bales.

TRANSPORTATION. In 1919 there was constructed only 2 miles of first track.

POLITICS AND GOVERNMENT. In October five white men, including one United States soldier, and a much larger number of negroes, were killed in a series of tragic incidents in Phillips

County. The trouble started when two white officers, who were on their way to Elaine in a motor car to arrest a white man wanted on a "bootlegging" charge, were fired upon at a negro church at Hoop Spur, one of the officers being killed and the other wounded. The church is said to have been full of armed negroes, members of a local organization called the "Farmers' Progressive and Household Union of America," which is said to have been formed for the purpose of enforcing demands that were to be made on the planters by their negro tenants or "share croppers." The Hoop Spur incident was followed by a collision between armed whites and negroes. Order was restored on the arrival of Governor Brough and 500 United States troops from Camp Pike, under command of Colonel Jenks. Considerable quantities of arms and ammunition were found in the hands of negroes. Eighty-six negroes were convicted in the Circuit Court at Helena of various offenses. The cases of 12 who were sentenced to death have been appealed to the Supreme Court, Governor Brough having granted stays of execution. In January, 1920, Robert L. Hill, the negro who was alleged to be the head of the "Farmers' Progressive and Household Union of America," was arrested at Topeka, Kan. He has been indicted in Phillips County on charges of having been accessory before the fact to the crimes of murder and night riding.

LEGISLATION. The year 1919 was unique in the State's legislative history because there were three sessions of the Legislature and a fourth session was called before the year was out. The largest amount of legislation enacted at the regular session, January 13th to March 13th, consisted of acts to create districts to build highways. The regular session ratified the prohibition amendment. The Legislature met in extra session July 28th-30th and by almost unanimous vote ratified the federal suffrage amendment. A second extra session, which met September 22d and adjourned October 1st, enacted a large amount of highway legislation curative of legislation that had been enacted at the regular session. Nearly all this legislation was on December 2d invalidated by the Supreme Court on the ground that the provision of the constitution requiring publication of intention to apply for special acts had not been complied with. Governor Brough then called a third extra session to meet Jan. 26, 1920.

Prior to the meeting of the 1919 Legislature, approximately 1405 miles of highway had been authorized under the general law and under special acts, the cost to be covered by bond issues totaling approximately \$14,000,000. The legislation enacted in 1919 authorized approximately 7195 miles of highways, the cost to be covered by bond issues totaling approximately \$86,340,000. Acts involving part of this road building programme remain to be validated by the special session that has been called for January, 1920. Road bonds are issued, not by the State, but by road districts, most of which are created by special acts of the Legislature. The State contributes to road building out of its revenue derived from the motor vehicle license tax, which during the year of 1919 amounted to \$475,000 and is rapidly increasing each year, and this fund is supplemented by federal aid, as in other States. See **COTTON**; **MINIMUM WAGE**.

ARKANSAS, UNIVERSITY OF. A co-educational, land-grant State institution, at Fayette-

ville, Ark. There are colleges of arts and sciences, education, medicine (at Little Rock), engineering, and agriculture (experiment station). The enrollment for the summer of 1919 was 500 and in the fall, 720; the faculty numbers 90. The institution was founded in 1871. President, John Clinton Farrell.

ARMENIA. Before the war according to statistics issued under the authority of the Armenian patriarch the Armenians were in a minority in five Ottoman vilayets, namely, Erzeroum, Tiflis, Kharput, Diarbekr, and Sivas, but were in a slight majority in the vilayet of Van where they numbered 185,000 out of the 350,000 inhabitants. In all six vilayets they formed only an average of 38.9 per cent of the population. In Cilicia they numbered 407,000 and in the central part of Trebizond they were placed at about 20,000, and in the eastern part 5000. The massacres and deportations during the war had greatly reduced their numbers, but exact figures were not available. According to the secret report of the president of a German Mission to Armenia during the war, published in 1919, the deportation of the Armenians had been organized systematically, region by region, from March to October, 1915. Nominally the population was to be removed to Mesopotamia, but, as a matter of fact, this was simply a pretext for destroying it. This book by a German authority devoted some 150 pages to an account of the atrocities and in many respects confirmed the Bryce report. According to the conclusions of the latter, the Armenian population before the atrocities of 1915 was between 1,600,000 and 2,000,000. Of these it was estimated that from 1,000,000 to 1,200,000 had been deported and that about half of these had perished. Figures published early in 1919 indicated that those who had escaped deportation numbered about 600,000; that those who had been deported but had survived, numbered 600,000; and that the rest had been massacred or had died of disease or hardships. The German authority above-mentioned quoted Turkish figures showing the number of Armenians killed at 300,000. The total number of killed was estimated at greatly above that and corresponded to the figures of the Bryce report. The American committee for Armenian relief reported in 1916 that the number of deaths was between 600,000 and 850,000. The Armenian delegation at Paris in March, 1919, declared that before the war the Armenians of Turkey numbered a little more than 2,000,000, and that during the war over a million Armenians had perished. Summing up the results of these various estimates, it would seem probable that the present number of survivors did not exceed the 1,200,000 mentioned in the Bryce report. The Armenian delegation estimated the number of Armenians in the former territory of Russia to the south of the Caucasus at about 1,800,000, of whom 1,300,000 were found in Russia proper; also that the Armenians scattered in different parts of the world numbered about 823,000. Thus the estimate of the total number in the world comes to about 4,000,000, of which less than 3,000,000 are grouped in the Armenian regions of Asiatic Turkey and Russia. See WAR OF THE NATIONS.

ARTILLERY. See MILITARY PROGRESS; NAVAL PROGRESS, etc.

ASHBROOK, ROBERT THOMAS FLOWER. Eighth Viscount Ashbrook, died March 9th. He

was born April 1, 1836. He was the inventor of an automatic hand loom, which has been extensively employed.

ASIA. See CHINA; JAPAN; EXPLORATION; and other subdivisions.

ASIA MINOR. See ANATOLIA; and TURKEY.

ASPHALT. The quantity of asphalt and allied substances produced in the United States in 1918 was 1,237,853 short tons, valued at \$18,540,032. This was a decrease in output of 190,473 short tons, or about 13 per cent. The value increased \$2,627,604, or 16.5 per cent, compared with the production in 1917, which was 1,428,326 short tons, valued at \$15,912,428.

The demand for imported native asphalt is still large, but the relative abundance and adaptability of petroleum asphalt has reduced considerably the production of native bitumens and bituminous rock from domestic quarries. Nevertheless, the increased price of domestic native bitumens more than offset the decline in output.

Crude native asphalt and allied substances imported for consumption in the United States in 1918 totaled 115,663 short tons, valued at \$814,752. There was a decrease in quantity of 72,702 short tons, or about 39 per cent, and a decline in value of \$305,105, or 27 per cent, compared with 1917. The resumption of normal conditions was expected to restore the importations of asphalt to pre-war proportions.

Petroleum asphalt (including road oil and flux) produced in 1918 from oil of domestic origin totaled 527,575 short tons, valued at \$7,435,204, a decrease in output of 174,234 short tons, or about 25 per cent, and in value of \$299,487, or only about 4 per cent, compared with 1917. The amount manufactured in this country from Mexican petroleum increased about 1 per cent in quantity and nearly 39 per cent in value.

Extensive projects for improvement of urban highways were taken as indicating a successful outlook for the domestic asphalt industry.

ASTOR, WILLIAM WALDORF. American multi-millionaire, great-grandson of John Jacob Astor, died in London, October 18th. He was a British subject at the time of his death, and had been in 1916 created a baron and raised to the peerage under the title Viscount of Hever Castle. He was born in New York City, March 31, 1848, and studied law for the purpose of qualifying himself to manage the Astor estate. For a short time he was interested in politics and was elected to the New York Assembly in 1877, and to the New York Senate in 1879, and ran for Governor against Roswell P. Flower, but was defeated, (1881). He was afterwards appointed minister to Rome. While holding this office (1882-85) he pursued the studies of art and literature which had always attracted him. In 1886 he published the novel *Valentino* and in 1889 *Sforza*. The fortune left by his father has been estimated at \$200,000,000, largely invested in real estate. The Astor holdings in New York covered a very wide area and dated back to the time when the original Astor purchased real estate on what was then the King's Highway, afterwards Broadway. Mr. Astor built three great hotels in the city, namely, the Netherlands, the Waldorf, and the Astor. In 1890 he went to England, settled there, and in 1899 became a British subject. From that time on his interests were exclusively British and he was a member of the most conservative element. His ex-

patriation, as it was called in the press, gave rise to wide discussion and speculation as to its cause. Much was said about his desire to escape publicity and the discussion of his private affairs in the American press. According to other accounts he left America as the result of some family quarrel. The fact that he became a British subject occasioned an amount of comment in the American press far out of proportion to its significance, and this was generally marked by a spirit either of astonishment or contempt at the course he had taken. He was not a member of the Anglo-American circle in England, but only of the more exclusive conservative English society. For some years he exerted a certain influence as proprietor of the *Pall Mall Gazette*, which he turned into a Liberal from a Conservative organ, with the result that its entire staff resigned and founded the *Westminster Gazette*. He was also proprietor of the *Pall Mall Magazine*, more or less literary in its purpose and not aiming at commercial success. To this he contributed largely himself. Various rumors were afloat during the war as to the duties on his estate. These duties were 20 per cent in England on fortunes over \$1,000,000. In some quarters it was said that his income tax during the war on both his American and English revenues exceeded the amount of the income itself. His elevation to the peerage in 1916 was supposed to be in recognition of his generous contributions to the war fund. In England he built a magnificent office for the management of his estates next to the Law Temple in London and he bought the magnificent Cliveden estate at Taplow, Bucks, which he gave to his son Waldorf Astor. He married in 1878 Mary Dahl Paul, daughter of James W. Paul of Philadelphia. His eldest son Maj. Waldorf Astor who succeeded to the viscountcy was a Conservative in politics and a member of Parliament. The younger son, John Jacob Astor, was a captain in the Life Guards. Mr. Astor's property in New York City was estimated at a value of about \$60,000,000. Two months before his death deeds of trust were filed turning over to a trusteeship all his property to be held for his sons, and it was understood that this step was taken to escape the inheritance tax of 5 per cent on bequests of over \$1,000,000. The extent of his New York property appears from a list based on the 1911 assessments, according to which it extended all over the city from points in the southern extremity to upper Broadway, and ranging far toward the east and west sides. Its total assessed value at that time was \$50,290,000. In 1915 he deeded to his younger son the most valuable of the down-town holdings. The step taken for the trusteeship in 1919 marked the final stage in the policy, apparently pursued constantly after 1911, of quietly disposing of the property during his lifetime.

His eldest son, who succeeded to the title, took immediate steps to relinquish it in order to retain his seat in the House of Commons, but in this he was unsuccessful. On his becoming a peer, his seat in the lower House was vacant, and his wife, formerly Miss Nancy Langhorne of Virginia, immediately stood for Plymouth on the Unionist ticket as his successor in a spirited election contest, which was widely noticed in the British and American press. She won by a considerable plurality over her Labor and Liberal opponents (November 15th). She was the sec-

ond woman to be elected to Parliament, the first being Countess Markievicz who was elected on the Sinn Fein ticket, but did not take her seat. Lady Astor's audacities and ready sallies in the course of the campaign were much quoted in the press.

ASTRONOMY. A new international organization of astronomers was effected in July, 1919, in connection with the meeting, at Brussels, of the International Research Council. The new body is known as the International Astronomical Union, and will comprise representatives from corresponding national astronomical unions in the several countries. Meetings of the central body will ordinarily be held every three years. The next conference is to meet in Rome in 1922. M. Baillaud, director of the observatory of Paris, was elected president of the Union and Prof. A. Fowler, of the Imperial College of Science, South Kensington, secretary. Upwards of 30 committees have been appointed to supervise international undertakings in special branches of astronomy. The international exchange of astronomical telegrams is to be conducted hereafter through the Royal Observatory of Belgium, at Uccle, instead of through Kiel. Harvard College Observatory remains the centralizing agency for such telegrams in America. An international abstracting journal of astronomy has been started at the Paris Observatory, replacing the *Bulletin Astronomique* of that institution. It is called the *Revue Générale des Travaux Astronomiques*, and will appear monthly.

STRUCTURE OF THE UNIVERSE. Fresh light has been thrown upon the structure and extent of the stellar universe, especially through the remarkable researches of the Mount Wilson Observatory (which institution, it may be noted, has now dropped the designation "Solar" from its title, thus signaling the enlarged programme of its activities). The current annual report of this observatory says: "The continuation of a comprehensive investigation of globular star-clusters has resulted in an important addition, comprising novel and radical features, to existing theories of cosmogony. The absolute distances of all known globular clusters have been derived, directly or indirectly, from a remarkable relation which gives the absolute magnitude of a typical Cepheid variable star when its period of light variation is known. The clusters are thus found to range in distance from 6500 to nearly 70,000 parsecs, and to be secondary organizations in comparison with the Galaxy, which appears vastly greater in extent than hitherto supposed. Less complete evidence also supports the view that the spiral nebulae, instead of being 'island universes,' are part and parcel of a single, all-embracing sidereal system. The average brightness of the faint temporary stars discovered in spiral nebulae, of which 14 have now been found, may serve as a valuable means of measuring the distances and dimensions of these objects. The general investigation also indicates that a large, open, flattened star-cluster exists in the neighborhood of the sun, with its centre some 50 parsecs to the north of the central plane of the Galaxy. This immediately suggests the hypothesis that the phenomenon of star streaming results in part from the apparent motion of this cluster through a general field of stars widely scattered through space."

Dr. and Mrs. Harlow Shapley, of the Mount Wilson staff, who have made a special study of

the globular clusters, have recently brought to light the interesting fact that these objects are not generally spherical, but oblately spheroidal. The same investigators have also recently made several additions to the list of known globular clusters, bringing the total number up to 86. Their survey of these clusters leads to the probable result that every faint, little condensed cluster in galactic latitude higher than 15° or 20° is really globular, while the similar faint clusters along the galactic equator are, without exception, open groups, with no condensed background of faint stars appearing on photographic plates of long exposure. Thus the evidence grows continually stronger that open and globular clusters occupy regions of space that are mutually exclusive.

At the beginning of the year Prof. E. E. Barnard, writing in the *Astrophysical Journal*, returned to the subject of the curious dark markings in the sky concerning which he has published earlier papers, and gave a catalogue of 182 of these markings. He believes that some dark places seen in celestial photographs are actual vacancies, but that others are unquestionably due to intervening opaque masses. Whether these masses are gaseous or non-gaseous remains problematical. Some of the dark nebulae (if we may thus describe them) in the Milky Way are not necessarily devoid of light, for they may appear black merely by contrast with their bright background. There are numerous examples, however, which are not in the Milky Way, and which are perhaps totally devoid of light. It would seem that such bodies would be lost in the blackness of space, but they actually appear as black objects against space itself. This fact leads Professor Barnard to believe that interstellar space is pervaded with a feeble illumination. Two regions of the sky visible in the northern hemisphere are specially rich in these dark markings: viz., the region immediately north of Theta Ophiuchi, and the region of the great star-cloud in Scutum, near the cluster M 11.

The celestial illumination above mentioned must not be confused with another phenomenon to which Professor Barnard has recently called attention (*Proc. Amer. Phil. Soc.*, no. 3, 1919); viz, self-luminous night haze, which varies greatly in appearance from time to time and is apparently a phenomenon of the earth's atmosphere.

OTHER SIDEREAL PROBLEMS. Gyllenberg, of the University of Lund, Sweden, has published a notable discussion of the variable stars of long period, of which Mira Ceti is the most familiar example. An abstract of this publication is given by Professor Russell in the *Scientific American*, March 29, 1919. About 750 of these stars are now known, and their average period of variation is about 300 days, while their fluctuations in brightness generally amount to three magnitudes or more. A few are more than a thousand times brighter at maximum than at minimum. The general conclusion reached by Mr. Gyllenberg is that these stars must be classed among the "giants," since at maximum they average about 150 times the brightness of the sun. At minimum they probably sink to the sun's brightness, or, in a few cases, below it; but they are certainly not stars which are at the point of extinction, and flaring up at intervals "like a candle flickering in its socket."

J. H. Jeans, of Cambridge, continues his brilliant mathematical contributions to the subject of cosmogony, one result of which has been to rehabilitate to a large extent the Nebular Hypothesis of Laplace. He states in a recent paper that "Laplace's fundamental ideas, when developed mathematically to their logical conclusions, show a striking capacity for interpreting many if not most of the formations observed in the sky. The only formation which Laplace's hypothesis now seems definitely unable to explain is, paradoxically enough, just that particular one which it was specially created to explain, namely the solar system."

The new spectroscopic method of determining stellar parallaxes, developed by Adams at Mount Wilson Observatory, has now been applied to between 1500 and 1600 stars, including nearly all stars with trigonometric parallaxes and an extensive list of those with very large and very small proper motions. Hardly a single serious contradiction has been found between the spectroscopic and the trigonometric results. (*Proc. Nat. Acad. Sci.*, July, 1919.)

Professor Lindemann, in the *Monthly Notices*, R. A. S., March, 1919, deals at length with the application of the photo-electric cell to celestial photometry. The process is not new, having been extensively used in Germany since it was proposed, a decade ago, by Elster and Geitel, and also to some extent in the United States, but Professor Lindemann's paper furnishes a detailed account of the apparatus and points out a wide range of problems that may be investigated by this simple and sensitive method.

THE SOLAR ECLIPSE OF MAY 29 AND THE RELATIVITY THEORY. By far the most interesting topic of discussion in astronomical circles during the year, and one which attracted world-wide popular attention, related to the observations made during the total solar eclipse of May 29, 1919, for the purpose of testing the Relativity Hypothesis of Albert Einstein. This eclipse, the path of which crossed South America, the South Atlantic Ocean and Africa, was successfully observed by several expeditions, and furnished data of importance in regard to the effects of eclipses on radiotelegraphic signals and on terrestrial magnetism, but the most momentous results were those obtained by two British expeditions, which concentrated their efforts upon the task of securing series of photographs of the stars in the immediate vicinity of the sun in order to determine whether their light was deflected in the manner called for by the hypothesis above mentioned. One party, under Professor Eddington, was stationed at Principe, West Africa, and the other, under Dr. Crommelin, at Sobral, Brazil. At both places good photographs were obtained. The conditions for this test were especially favorable, as the sun was in a region of the sky that is rich in bright stars, and the duration of totality was longer than usual. The measurements of the plates, which were communicated at a joint meeting of the Royal Society and the Royal Astronomical Society on November 6th, showed beyond question that those stars whose images fell near the eclipsed sun were apparently shifted away from the sun's centre (as compared with stars farther from the sun, serving as standards of reference), and the amount of the shift in each case agreed closely with that predicted by the Einstein hypothesis.

The Hypothesis—or, as it now deserves to be

called, the Theory—of Relativity pertains to the domain of mathematical physics and has been prominent in advanced physical literature for more than a decade. It involves a fundamental departure, in principle, from the Newtonian theory of gravitation, but, as Einstein himself has stated, in practical application the two agree so closely that it has been difficult to find cases in which the actual differences could be subjected to observation. These cases fall within the field of astronomy, and are as follows:

1. The distortion of the oval orbits of planets around the sun. (Confirmed in the case of Mercury. The theory explains a hitherto unaccountable displacement in the perihelion of this planet.)

2. The deviation of light-rays in a gravitational field. (Presumably confirmed by the eclipse photographs just mentioned.)

3. The shifting of spectral lines toward the red end of the spectrum in the case of light coming to us from stars of appreciable mass. (Not yet confirmed, though the shift required by the theory is of such magnitude that it ought to be easily detected by the refined spectroscopic methods now in common use at observatories. The fact that this shift has not been found is the chief outstanding obstacle to the complete acceptance of the theory.)

SUN AND PLANETS. The last sun-spot maximum occurred about August, 1917. Although the descending curve of spottedness has been generally steep since that time, the year 1919 was one of considerable solar activity. Two remarkable prominences were photographed at Mount Wilson; one, on May 29th, rose to the enormous altitude of 760,000 kilometers (472,000 miles) above the sun's surface; the other, on July 15th, attained an altitude of 720,000 kilometers (447,000 miles). Curious irregularities in the movements of these prominences have been studied with the aid of photographs taken at intervals of a few minutes. (*Popular Astronomy*, December, 1919.)

C. G. Abbot (*Proc. Nat. Acad. Sci.*, September, 1919), in an account of the simultaneous observations of solar radiation made during 1918 at Mount Wilson and at Calama, Chile, states that the results furnish strong evidence that the short-period variations noted in the radiation received at the earth are in the sun itself. The radiation observations at Calama are now telegraphed regularly to the Argentine meteorological service, for application in weather forecasting.

The 11th report of the Mars Section of the British Astronomical Association, dealing with the apparition of 1913-14, was published in April, 1919. The most interesting feature of this apparition was the exceptionally slow diminution of the north polar snow cap, and the coincidence of this fact with the great minimum of solar activity. The shrinkage of the snow cap lagged behind the normal much more than at any time since 1864, as if solar heat were lower in 1913 than during any of the 10 previous apparitions of Mars in which the planet was observed partly or wholly in the same heliocentric longitudes.

In 1915 the late Prof. Percival Lowell calculated, from perturbations in the orbit of Uranus, that a trans-Neptunian planet exists with an orbit about 12,000,000,000 miles in diameter. In consequence of further investigations, by W. H. Pickering, which also take account of

perturbations of Neptune, it was predicted that the hypothetical planet would be in opposition at the end of December, 1919, and Harvard College Observatory invited astronomers to aid in a search for it.

COMETS. Five comets were discovered during the year, four of which proved to be periodic comets previously known: viz, Kopff's, found by Gonnessiat in August; Brorsen's, by Metcalf in August; Finlay's, by Sasaki in October; and Schaumasse's, by its original discoverer in October. A new comet was discovered, independently, by Metcalf and Borely in August.

CALENDAR AND TIME. The perennial question of reforming the calendar assumed unusual prominence early in 1919, owing to discussions of the subject in the French Academy of Sciences and the opportunity supposed to be afforded by the Peace Conference for both improving and unifying the calendars in use in different countries. Proposals were put forth by Bigourdan, Deslandres, Flammarion, Ch. Nordmann, and others, but nothing definite seems to have been accomplished.

The long-mooted proposal to change the beginning of the astronomical day from noon to midnight, thus bringing astronomical time into conformity with civil time, has been accepted by the British Admiralty, which announces that the change will be inaugurated in the British Nautical Almanac for 1925. It is supposed that the other countries which issue nautical almanacs will make the same change at the same time.

NECROLOGY. Prof. Edward C. Pickering, director of Harvard College Observatory for 42 years and president of the American Astronomical Society for 13 years, died Feb. 3, 1919. Among the other eminent astronomers who died during the year were Prof. A. Riccò, director of the Observatory of Catania, and Prof. C. L. Doolittle, professor emeritus of astronomy at the University of Pennsylvania.

ATHLETICS, TRACK and FIELD. The triumph of the United States in the Inter-Allied meet held in Pershing Stadium, France, during June and July was the feature of the year 1919 in track and field athletics. The points scored by the Americans totalled 92. France finished second with 12, followed by New Zealand with 6, Australia with 5, Canada with 4, and Greece with 1. The winners of some of the principal contests were:

100-meter dash, Charles W. Paddock, U. S., 10 $\frac{1}{4}$ seconds; 200-meter dash, Paddock, 22 seconds, unofficial; 400-meter run, Earl Eby, U. S., 50 seconds; 800-meter run, Daniel L. Mason, New Zealand, 1 minute 55 $\frac{1}{2}$ seconds; 1500-meter run, Clyde Stout, U. S., 4 minutes 51 $\frac{1}{2}$ seconds; modified marathon, Jean Vermeulen, France, 55 minutes 11 seconds; 110-meter high hurdles, Robert Simpson, U. S., 15 $\frac{1}{2}$ seconds; 200-meter hurdles, Simpson, 24 $\frac{1}{2}$ seconds; running high jump, Clinton Larsen, U. S., 6 feet 1 inch; running broad jump, Sol Butler, U. S., 24 feet 9 $\frac{1}{2}$ inches; standing broad jump, William Taylor, U. S., 9.37 feet; hop, step, and jump, Herbert Prem, U. S., 48 feet; pole vault, F. W. Floyd, U. S.; pentathlon, Robert le Gendre, U. S.; javelin throw, George Bronder, U. S.; discus throw, Charles Higgins, U. S.; shot put, Edgar Caughey, U. S., 44.08 feet.

Relay Races—800-meter, U. S. first, Canada second, Australia third, 1 minute 30 $\frac{1}{2}$ seconds, (U. S. team Charles Paddock, Marshall Had-

dock, E. A. Torkelson, Edward A. Teschner); 1600-meter, U. S. first, Australia second, France third, 3 minutes 20½ seconds, (U. S. team Earl Ehy, Edward A. Teschner, J. Meehan, Edward Campbell); medley race, U. S. first, Australia second, France third, 7 minutes 43 seconds, (U. S. team Carl F. Haas, William C. Grey, F. F. Campbell, Edward A. Teschner).

Fencing—Individual foils, winner, Nadio Nadi, Italy; épée, winner, Henri Laurant, France; saber team, winner, Italy; foils team, winner, France; épée team, winner, France.

Shooting—rifle shooting, team, U. S. first, Canada second; rifle shooting, individual, Stanley Smith, U. S. first, Lester U. Hansen, U. S. second, Richard I. Ditus, U. S., third; pistol shooting, team, U. S. first, France second, Italy third; pistol shooting, individual, Michael Kelly, U. S. first, D. R. Raymond, U. S., second, Paul Bird, U. S., third.

Swimming—110-meter, free style, Norman Ross, U. S. first, L. T. Solomon, Australia, second, I. Stedman, Australia, third; 100-meter back stroke, Norman Ross, first, H. M. Gardner, U. S., second, Daniel Lehu, third; 400-meter, free style, Norman Ross, first, W. Longworth, Australia, second, I. Stedman, Australia, third; 800-meter, free style, Norman Ross, first, W. Longworth, second, Luigi Bacigalupe, Italy, third; 800-meter relay, free style, Australia first, U. S. second, Italy third.

Boxing (winners of finals)—bantamweight, Digger Evans, Australia; featherweight, De Ponthieu, France; lightweight, McNeil, U. S.; welterweight, J. Attwood, Canada; middleweight, Edward Eagen, U. S.; heavyweight, Robert Martin, U. S.

Wrestling (winners of finals)—catch as catch can, Slinger, U. S., bantamweight; Jahault, Italy, featherweight; Farley, U. S., welterweight; Metropolis, U. S., lightweight; Prem, U. S., middleweight; Parcaut, U. S., light heavyweight; Salvatore, France, heavyweight. Greco-Roman, Wiseman, U. S., bantamweight; Dierk, Belgium, featherweight; Beranek, Czechoslovakia, lightweight; Halick, Czechoslovakia, welterweight; Vanantwerpen, Belgium, middleweight; Koprive, Serbia, light heavyweight; Berhard, France, heavyweight.

France carried off the honors in the golf competitions held in connection with the Inter-Allied meet, winning both the team and the individual contests. In tennis, the singles final was won by Gobert of France, while in the doubles match Wood and Lycett of Australia triumphed over Washburn and Mathey of the United States.

Joie W. Ray of the Illinois Athletic Club and Frank K. Foss of the Chicago Athletic Association were the two American athletes to distinguish themselves by their brilliant performances on track and field during 1919. Ray's star achievement of the year was his running 1000 yards in the national indoor championships held at Brooklyn in the record breaking time of 2 minutes 13½ seconds. Foss set a new pole vault mark of 13 feet 3¾ inches. This leap erased the old world figures for the event, 13 feet 2¼ inches, made by Marc S. Wright some years back.

The national Amateur Athletic Union senior outdoor championships were held at Philadelphia on September 13th, the team honors going to the New York Athletic Club with a total of 46 points. The Chicago A. A. was second with 40

points, and the Illinois A. C. third with 26 points.

Other clubs to score were: Boston A. A., 21; Multnomah A. A., 11; Loughlin Lyceum, 11; Spokane A. C., 7; Millrose A. A., 5; Paulist A. C., 5; Pittsburgh A. A., 5; Mohawk A. C., 4; Cross Country Club of Baltimore, 3; Meadowbrook Club, 3; Notre Dame University, 3; University of Chicago, 3; Olympic Club of San Francisco, 2; Salem-Crescent A. C., 2; U. S. Marine Corps, 2; St. Christopher Club, 1; Baltimore A. A., 1.

The individual winners in the senior outdoor meet were: 100-yard dash, William B. Hayes, Boston A. A., 10½ seconds; 220-yard dash, Henry Williams, Spokane A. C., 21¼ seconds; 440-yard run, Frank Shea, Pittsburgh A. A., 51½ seconds; 880-yard run, Joie Ray, Illinois A. C., 1 minute 56 seconds; 1-mile run, Joie Ray, Illinois A. C., 4 minutes 14¾ seconds (new record); 3-mile walk, William Plant, Morningside A. C., 22 minutes 3½ seconds; 120-yard high hurdles, Robert Simpson, Illinois A. C., 15½ seconds; 220-yard low hurdles, Robert Simpson, Illinois A. C., 24¾ seconds; 440-yard low hurdles, Floyd Smart, Chicago A. A., 55¾ seconds; 5-mile run, Charles Pores, Millrose A. A., 26 minutes 2 seconds; running high jump, John Murphy, Multnomah A. A., 6 feet 3¾ inches (new record); throwing 16-pound hammer, Patrick Ryan, Loughlin Lyceum, 175 feet 5¾ inches; running broad jump, Floyd Smart, Chicago A. A., 22 feet 7¼ inches; putting 16-pound shot, Patrick McDonald, New York A. C., 45 feet 8 inches; pole vault, Frank Foss, Chicago A. A., 12 feet 9 inches; running hop, step, and jump, Sherman Landers, Chicago A. A., 47 feet 8¾ inches; throwing 56-pound weight, Patrick McDonald, New York A. C., 37 feet 6 inches; throwing the discus, Arlie Mucks, Chicago A. A., 143 feet 9¾ inches.

The national senior indoor championships were contested at the 13th regiment armory, Brooklyn, N. Y., on March 8th. The team winner was the Boston A. A., with 13 points. The St. Louis A. A. and the Marietta, Ohio, Y. M. C. A. were tied for second honors with 10 points each. Six teams were deadlocked for third place with 5 points each. They were Glencoe A. C., Illinois A. C., University of Chicago, New Hampshire State College, Cornell University, and Princeton University. Other point winners were: University of Pennsylvania, 4; Pastime A. C., 4; Chicago A. A., 3; Loughlin Lyceum, 3; Lafayette College, 3; Bronx Church House, 2; Clark House A. A., 2; Paulist A. C., 2; Meadowbrook Club, 2; Columbia University, 2; Stevens Institute of Technology, 2; Morningside A. C., 1; Brooklyn A. A., 1; Knights of St. Antony, 1; unattached, 32.

The individual winners were: 60-yard dash, Loren Murchison, St. Louis A. A., 6¾ seconds; 300-yard run, Loren Murchison, St. Louis A. A., 32¾ seconds; 600-yard run, Jack Sellers, unattached, 1 minute 15¾ seconds; 2-mile run, Gordon Nightingale, New Hampshire State College, 9 minutes 28¾ seconds; 1000-yard run, Joie Ray, Illinois A. C., 2 minutes 16¾ seconds; 2-mile walk, Edward Renz, unattached, 14 minutes 33¾ seconds; running high jump, Walter Whalen, Boston A. A., 5 feet 11 inches; standing broad jump, Lieut. William Taylor, Marietta, Ohio, Y. M. C. A., 10 feet 5¾ inches; 1½-mile relay, Boston A. A.

The national junior outdoor championships were held at Franklin Field, Philadelphia, on September 12th, the New York A. C. athletes rolling up the largest number of points, 34. The Boston A. A. was second with 20 points, and the Multnomah A. A. third with 20. The teams of Princeton University and the Pastime A. C. tied for first honors in the junior indoor meet which was held at Brooklyn on February 15th, with 10 points each.

The 43d annual outdoor track and field championships of the Intercollegiate Association of Amateur Athletes of America were held at the Harvard Stadium, Cambridge, Mass., on May 30th and 31st. The point honors were captured by Cornell University with a total of 39½ points. The University of Pennsylvania finished second with 29 points, and the University of Michigan third with 25½ points. Other point winners were: Harvard University, 23; Dartmouth College, 14; Yale University, 13½; Princeton University, 12; Bowdoin College, 9; Rutgers College, 5½; Massachusetts Institute of Technology, 5; University of Maine, 5; Lafayette College, 4; Columbia University, 3; Syracuse, 3.

The individual victors were:

100-yard dash, W. Creed Hammond, Pennsylvania, 10 seconds; 220-yard dash, W. Creed Hammond, 21¾ seconds; 440-yard run, K. A. Mayer, Cornell, 49¾ seconds; 880-yard run, K. A. Mayer, 1 minute 56¾ seconds; 1-mile run, Denis F. O'Connell, Harvard, 4 minutes 23¾ seconds; 2-mile run, Ivan C. Dresser, Cornell, 9 minutes 22¾ seconds (new intercollegiate record); 120-yard high hurdles, Walker Smith, Cornell, 15½ seconds; 220-yard low hurdles, Walker Smith, 24¾ seconds; running high jump, R. W. Landon, Yale, 6 feet 2 inches; running broad jump, Carl E. Johnson, Michigan, 23 feet 10½ inches; pole vault, E. E. Myers, Dartmouth, 12 feet 6 inches; putting 16-pound shot, W. H. Allen, Maine, 44 feet 6¼ inches; throwing 16-pound hammer, L. H. Weld, Dartmouth, 143 feet 2¼ inches.

Frederick W. Rubien, secretary-treasurer of the Amateur Athletic Union, made the following All-America selections for the year 1919:

All-America Athletic Team—100-yard dash, Charles W. Paddock, University of Southern California; 220-yard dash, Henry Williams, Spokane A. C.; 440-yard run, Frank J. Shea, Pittsburgh A. A.; 880-yard run, Homer Baker, Glencoe A. C.; 1-mile run, Joie W. Ray, Illinois A. C.; 2-mile run, Ivan C. Dresser, Cornell University; 5-mile run, Charles Pores, Millrose A. A.; 10-mile run, Fred Fallor, Dorchester A. A.; 120-yard hurdles, Fred W. Kelly, New York A. C.; 220-yard hurdles, Robert C. Simpson, Illinois A. C.; walking, William Plant, Morningside A. C.; running high jump, John Murphy, Multnomah A. A.; running broad jump, Sol Butler, Dubuque College; running hop, step, and jump, Sherman G. Landers, Chicago A. A.; putting 16-pound shot, P. J. McDonald, New York A. C.; throwing 56-pound weight, M. J. McGrath, New York A. C.; throwing the discus, A. W. Mucks, Chicago A. A.; throwing 16-pound hammer, P. J. Ryan, Loughlin Lyceum; throwing the javelin, George A. Bronder, New York A. C.; pentathlon, Robert le Gendre, Georgetown University; all-around, S. Harrison Thompson, Princeton University; marathon, Carl Linder, Hurja Club, Boston, Mass.

All-America College Team—100-yard dash, Charles W. Paddock, University of Southern

California; 220-yard dash, W. Creed Hampton, University of Pennsylvania; 440-yard run, E. C. Curtis, University of Chicago; 880-yard run, K. A. Mayer, Cornell University; 1-mile run, Denis F. O'Connell, Harvard University; 2-mile run, Ivan C. Dresser, Cornell University; cross country, John Simmons, Syracuse University; 120-yard hurdles, Walker Smith, Cornell University; 220-yard hurdles, Carl Johnson, University of Michigan; running high jump, R. W. Landon, Yale University; running broad jump, Sol Butler, Dubuque College; pole vault, E. E. Myers, Dartmouth College; putting 16-pound shot, W. H. Allen, University of Maine; throwing 16-pound hammer, L. H. Weld, Dartmouth College; throwing the discus, E. Gilfillan, University of Notre Dame; throwing the javelin, R. M. Angier, University of Chicago; pentathlon, Robert le Gendre, Georgetown University.

All America Scholastic Team—100-yard dash, E. A. Torkelson, Phillips Exeter Academy; 220-yard dash, J. R. Patterson, Port Jervis H. S.; 440-yard run, W. I. L. Adams, Hill School; 880-yard run, M. Richman, South Side H. S., Newark, N. J.; 1-mile run, J. Connolly, Woburn H. S.; 2-mile run, G. Douglass, Central H. S., Newark, N. J.; cross country, J. Helme, Lafayette H. S., Buffalo, N. Y.; 120-yard hurdles, A. Young, Haverford H. S.; 220-yard hurdles, M. Graham, Bethlehem prep.; running high jump, Harold Muller, Oakland Technical H. S.; running broad jump, Carl Beck, Harrisburg Technical H. S.; pole vault, A. Hulman, Worcester Academy; putting 12-pound shot, A. Foster, Bethlehem Prep; throwing 12-pound hammer, Ralph G. Hills, Hill School; throwing the discus, F. F. Rutans, Hill School; throwing the javelin, Arthur Tuck, Oregon School.

After a lapse of five years due to the war the Amateur Athletic Association of Great Britain resumed its championships at Stamford Bridge, London, on July 5th. Much to the disappointment of a large crowd of spectators no American athletes were able to compete; but practically every part of the British Empire was represented. A notable performance was the running of the 100-yard dash by W. A. Hill of the Surrey A. C. in 10 seconds flat.

In the Scandinavian track and field championships contested at Stockholm, the Swedes were victorious with a total score of 39 points. Norway was second with 23 points, while Denmark finished last with 22 points. See CROSS COUNTRY RUNNING AND MARATHONS.

ATOMIC STRUCTURE. See CHEMISTRY, GENERAL PROGRESS OF.

AUSTRALIA, COMMONWEALTH OF. A self governing dominion of the British Empire consisting of the six original States of New South Wales, Queensland, Victoria, South Australia, Western Australia, and Tasmania, and of two territories, the Northern Territory, and the Federal Territory. It lies between the Indian and Pacific Oceans and consists of the island continent of Australia and the adjacent small islands. The temporary seat of government is Melbourne, Victoria, but the permanent seat will be Canberra, the district of Yass-Canberra having been acquired from the State of New South Wales in 1910 (area about 940 square miles) and constituting the Federal Territory.

AREA AND POPULATION. The following table shows the estimated area in square miles and the population according to the census of April 3,

1911, and the estimates of June 30, 1918, by States and Territories:

States and Territories	Area Sq. Miles	Population	
		Census April 3, 1911	Estimated June 30, 1918
New South Wales...	309,432	1,646,784	1,897,084
Victoria	87,884	1,815,551	1,416,982
Queensland	670,500	605,818	705,588
South Australia	380,070	408,558	439,275
West Australia	975,920	282,114	311,121
Tasmania	26,215	191,211	202,842
Northern Territory...	523,620	8,310	5,269
Federal Territory...	940	1,714	2,404
Commonwealth ...	2,974,581	4,455,005	4,980,565

The above figures do not include the aborigines whose number has been variously estimated at from 75,000 to 100,000. The estimated population of the capital cities, with suburbs, Jan. 1, 1916, were: Sydney, New South Wales, 763,000; Melbourne, Victoria, 684,000; Brisbane, Queensland, 161,938; Adelaide, South Australia, 209,450; Perth, Western Australia, 106,792; Hobart, Tasmania, 39,838.

The marriages, births and deaths for 1917 as given by the *Statesman's Year Book* for 1919 were as follows:

States and Territories	Marriages	Surplus of		
		Births	Deaths	Births
States—				
New South Wales	13,246	52,448	17,941	34,507
Victoria	9,505	33,033	14,555	18,478
Queensland	4,868	19,787	6,555	13,232
South Australia...	3,252	11,326	4,365	6,961
Western Australia	1,621	7,882	2,769	5,113
Tasmania	1,138	5,376	1,768	3,608
Territories—				
Northern Territory	34	69	63	6
Federal Capital Territory	2	44	13	31
Total	33,666	129,965	48,029	81,936

In 1917 there were 65,089 arrivals and 87,039 departures, but among them was included the expeditionary forces, of whom there were 28,449 arrivals and 46,488 departures.

RELIGION AND EDUCATION. According to the census of 1911 there were: Christians, 4,274,414; non-Christians, 36,785; indefinite, 14,673; of no religion, 10,016; persons unwilling to state their religious beliefs, 83,003; unspecified, 36,114. The chief denomination was the Church of England with 1,710,443, and the rest in their order of numerical importance were: Roman Catholic, Presbyterian, Methodist, Baptist, Congregational, Lutheran, and Church of Christ. In 1917 New South Wales had 3412 government schools, 8228 teachers, and 282,757 pupils enrolled; 659 private schools with 3707 teachers and 75,326 pupils. Victoria had 2202 state schools with 6275 teachers, and 254,033 pupils; 495 registered schools with 1970 teachers, and 56,193 pupils. Queensland had 1545 government schools with 4075 teachers, and 88,259 pupils in average attendance; private schools, 156, with 841 teachers and an average attendance of 16,880. South Australia had 885 government schools with 7095 pupils; 169 private schools with 12,011 pupils. Western Australia had 646 government schools with 47,654 pupils; private schools, 123, with 11,484 pupils. Tasmania had, in 1916, 485 public elementary schools with 35,827 pupils. Besides government schools given

in the above figures there are high technical and other secondary schools in all the States and each of the capital cities of the States is the seat of a university; Sidney, 1917, teaching staff 175, students, 1736; Melbourne, 1332 students; Brisbane, teaching staff 29, students 227; Adelaide (1913), students 720; Perth (1913), students 182; Hobart (1916), students 98.

PRODUCTION. The following table taken from the *Statesman's Year Book* for 1919, shows area in crops and their yield in 1916-17:

Crops	Total Acreage	Total Yield Bushels	Yield per Acre Bushels
Wheat	11,532,828	152,420,189	13.22
Oats	844,130	14,018,009	16.61
Barley	230,253	4,080,492	17.72
Maize	360,072	8,527,136	23.68
Tons			
Hay	2,671,862	3,507,589	1.31
Potatoes ...	149,895	357,002	2.88
Sugar-cane .	178,190	1,723,072	21.24†
Beet Sugar..	1,840	15,159*	11.81
Grapes			
Vineyards ..	65,394	98,374	1.87‡
Gallons			
Wine	5,126,268	208.45§
Orchards and fruit gardens	257,687	£3,474,704	£13 9s. 8d.

* Beets worked. The sugar manufactured was 1,948 tons, and molasses 480 tons.

† Tons per acre of productive crops.

‡ Including 35,480 tons for wine from 25,201 acres of productive vines.

§ Gallons per acre of productive vines.

In 1916-17 the total area under crops was 16,806,380 acres, and the total value of the agricultural production was £60,206,764. The acreage of wheat for 1917-18 was placed at 9,678,000 with a yield of 114,886,000; oats at 580,000 with a yield of 9,850,000 bushels. The sugar crop for 1916-17 was placed at 335,000 tons and the estimated yield for 1917-18 at 315,000 tons. Later tobacco-growing has become important. The amount consumed per annum has been estimated at 15,000,000 lbs. of which according to expert opinion in 1919 at least 75 per cent would be locally produced in the near future.

ECONOMIC CONDITIONS. No definite figures were available for the production of industries and agriculture in 1919. However, some points in regard to general conditions were set forth by Mr. Mark Sheldon, Commissioner for Australia in the United States. According to him the country was enjoying the greatest prosperity in its history. This was due chiefly to the attitude of labor which was harmonious and considerate of the welfare of the country, also to the natural resources of Australia, and to the fact that it consisted of an English-speaking community. As to the labor movement, it had been orderly, and the results were good. The arbitration system had worked well, especially in the settlement of small disputes which would have culminated in strikes. The disorderly element characteristic of other countries had to a large degree been suppressed. For example, a law had been passed against the Industrial Workers of the World, which organization was declared illegal, and the result of it had been practically its suppression. The cost of staples was lower than in other countries, and the high cost of living was not burdensome. One great need of the country

was man power. It could make room to advantage for over 10,000,000, that is to say, over twice the present population. At the present time there was a severe shortage of transport, and the wheat crops of three seasons were still in storage for lack of shipping. The country was now undertaking measures for the expansion of trade. The new expanding industry was that of wine production, Australian wines having recently reached almost the same level as the wines of Spain and France. He declared that the country was behind Mr. Hughes, the Prime Minister, and heartily approved of all that he had done at the Paris Conference. It was estimated that about 90 per cent of the people supported him as the true representative of the country.

GRAZING. Australia is one of the chief sheep-raising countries of the world, but the number of sheep has declined in recent years. The revised figures for the close of the year 1916 give the number of sheep for the Commonwealth at 76,669,000, New South Wales having the greatest number. At the same date horses numbered 2,437,000; cattle, 10,459,000; and pigs, 1,006,763. Wool production in 1916-17 was placed at 547,702,295 pounds, valued at £35,964,000 as compared with 550,604,675 pounds in 1915-16, and 711,134,203 pounds in 1913-14. The exports of wool in 1916-17 were placed at about 396,000,000 pounds. See AGRICULTURE; DAIRYING.

MINING. The mineral production in the Commonwealth was valued in 1917 at £25,600,000 including gold, £6,180,000; coal, £5,600,000; copper, £4,860,000; silver and lead, £5,510,000; tin, £1,050,000. Australia is one of the chief gold-producing countries of the world and down to the end of 1917 had produced gold to the value of £584,100,000. The gold production reached its highest point in 1903 when it stood at £16,294,086, but since that time has steadily decreased. The leading States in gold production are: New South Wales, Victoria, and Western Australia. Total value of mineral production in Australia down to the end of 1917 was £928,100,000.

COMMERCE. In the first year of the war there was a great decline in both imports and exports, but there was a recovery to some extent in 1915-16. The trade including specie and bullion is shown in the following table which distinguishes total imports, domestic exports (that is, exports of Australian produce), and total exports. Figures for 1914 are for the first six months only; in that year the trade year was changed from the calendar year to the year ending June 30.

Years	Imports £	Exports		
		Australian Produce £	Other Produce £	Total £
1913	79,749,653	75,138,147	3,433,622	78,571,769
1914	89,777,497	86,265,764	1,664,828	87,930,087
1914-15	84,481,837	58,122,573	2,470,008	60,592,576
1915-16	77,521,142	71,792,525	2,985,796	74,778,321
1916-17	76,228,679	95,089,973	2,915,509	97,955,482
1917-18	60,368,144	72,059,207	2,979,975	75,039,182

The imports and exports of specie and bullion in 1916-17 were £272,264 and £12,015,605.

Leading imports in 1916 and 1917 and in 1917-18 (provisional) were in thousands of pounds sterling as follows: Metal manufac-

tures, £8266 and £7206; cotton and linen piece goods, £6302 and £6518; apparel, £3768 and £3302 (exclusive of hats and caps, £322 and £255; and boots and shoes, £449 and £239); drugs, chemicals, and fertilizers, 3130 and £3358; woollens, £3235 and £1895; machines and machinery, £2814 and £2095; oils in bulk, £2915 and £2686; silk pieces, £2505 and £2115; boxes and sacks, £2677 and £2659; paper, £3335 and £2107; tea, £1748 and £1551; timber, £1477 and £1427; spirits, £1745 and £1252; tobacco, £1115 and £548.

Leading exports in 1916-17 and 1917-18 (provisional) in thousands of pounds sterling were: Wool, £28,953 and £24,587; wheat, £13,375 and £5990; copper matte, ingots, bars and ore, £4317 and £3115; lead, pig and matte, £4150 and £3212; skins and hides, £2274 and £2856; beef, £4947 and £3699; flour, £3463 and £4420; zinc and concentrates, 1085 and £351; leather, £1159 and £779; butter, £5339 and £4904; mutton and lamb, £1541 and £453; rabbits and hares, £913 and £985; tin ingots, £571 and £1065; tin ore £232 and £28; coal, £416 and £256; tinned meat £997 and £2363; tallow, £1152 and £909. Trade with some other important countries in thousands of pounds sterling for 1916-17 was as follows:

To	Exports 1916-17
United Kingdom ..	£57,843,684
Canada ..	6,392,579
New Zealand ..	2,996,313
India ..	2,852,582
Ceylon ..	167,828
South African Union..	1,388,479
Java ..	730,911
Belgium ..	4,079,761
France ..	6,783,038
Germany ..	8,726,788
U. S. America ..	1,465,899
Japan ..	4,453,187
Russia ..	
Italy ..	

In the following table are given the figures of the direct foreign trade of Australia, imports to and exports from the several states for the year 1916-17.

States Imports	1916-17
New South Wales ..	\$159,387,931
Victoria ..	123,973,304
Queensland ..	30,479,886
South Australia ..	29,775,476
Western Australia ..	21,345,043
Tasmania ..	4,377,470
Northern Territory ..	402,824
Total ..	\$370,966,866

States Exports ¹	1916-17
New South Wales ..	\$244,740,295
Victoria ..	92,610,205
Queensland ..	70,769,967
South Australia ..	41,580,283
Western Australia ..	22,607,656
Tasmania ..	4,377,470
Northern Territory ..	64,477
Total, Australian produce ..	\$462,512,029
Reexports ..	14,188,824
Total exports ..	\$476,700,853

Australia's overseas trade for the fiscal year ending March 31, 1919, was greater in volume than in any year since the Commonwealth was established. It amounted to £211,439,667 (\$1,028,970,000), or more than £40 (\$194) per capita

for every man, woman, and child in Australia. In 1918, exports aggregated £112,648,347 (\$548,203,181), and the imports £98,791,320 (\$480,767,959), and the balance in favor of Australia was £13,857,027 (\$67,435,222). Australian exports, including gold, for the year ending June 30, 1919, were valued at \$547,959,852. Imports during this same period reached a value of \$480,767,956. The balance of trade in favor of the Commonwealth of Australia was therefore \$67,191,896. The exports and imports for this period were distributed among the different States as follows:

States	Exports	Imports
Victoria	\$185,561,968	\$188,680,580
New South Wales	245,281,808	213,481,837
Queensland	60,575,019	29,572,557
South Australia	56,048,794	30,836,840
West Australia	45,956,894	15,283,515
Tasmania	4,535,869	2,962,627
Total	\$547,959,852	\$480,767,956

FINANCE. Commonwealth revenue and expenditure are given as follows for the fiscal years ending June 30:

Revenue:	1915-16	1916-17	1917-18
Customs ...	£13,621,471	£12,869,931	£9,487,538
Excise ...	3,323,470	3,236,510	3,737,757
Land tax ...	2,040,176	2,121,847	2,123,778
Probate and success. duties	625,990	1,062,013	943,232
Income tax.	3,933,471	5,622,026	7,385,543
Post, Telegraph and Telep...	5,055,183	5,488,765	5,755,722
All other...	2,028,182	4,184,081	7,369,398
Total revenue.	£30,627,943	£34,035,173	£36,802,968
Loans	60,424,689
Total receipts.	£91,052,632
Expenditure:			
Old age pen- sions ..	£2,859,766
Maternity al- lowances ..	659,715
Defense and fleet	46,107,439	66,279,091	70,665,205
P O Dept.	5,983,780	5,883,811	5,677,415
All other	3,302,740	*9,123,398	*8,433,163
Total expend.	£58,913,440	£81,286,300	£84,775,783
Contribution to States	6,346,995	6,270,419	6,340,374
Total disburse- ments	£65,260,435	£87,556,719	£91,116,157

*Including old age pensions and maternity allowances.

For 1918-19 the estimated revenue was £40,670,500, and the estimated expenditure £45,344,595 as reported for June 30, 1918. To meet the deficit it was proposed to increase the income tax by 30 per cent and the land tax by 20 per cent, and also to increase the taxes on liquors and amusements. Tariffs were raised to preserve enterprises begun in war-time. The total Commonwealth debt was £284,022,072 including the war loan from the British government of £49,082,059. The total of Australian war loans down to October, 1918, was £187,705,805. Total Australian war expenditure for five years ending June 30, 1919, was estimated at £284,641,608, of which the greater part, £238,809,847, was charged against loans. The public debt of the several States on June 30, 1917, was £372,517,623.

The following synopsis of the financial condition of the Commonwealth, supplied by the United States Bureau of Domestic and Foreign

Commerce, is based on the report of the acting treasurer of Australia:

The public debt of the Commonwealth of Australia at June 30, 1919, amounted to \$1,585,425,723, made up of the following items (American currency):

War loans raised in the Commonwealth..	\$944,521,767
Deduct repurchases and securities sur- rendered in payment of succession duties	21,480,706
Outstanding debt in Australia	928,041,061
Borrowed from British Government	231,158,750
Increase in foregoing amount owing to conversion operations by Brit- ish Government	7,699,070
Total war loans	1,161,898,881
Accrued deferred pay, Australian Imper- ial Forces to June 30, 1919	26,765,750
Indebtedness to Government of United Kingdom for maintenance, transport, and equipment of Australian Imperial Forces to June 30, 1919	180,736,948
Other public debt:	
Loans raised in London for the States for public works	81,513,875
Loans for Commonwealth, Works, land, loan redemption, etc:	
From notes fund	36,378,946
From sinking fund	1,455,132
From trust fund	21,759,922
Balance of Northern Territory loans taken over from State	11,840,720
Balance of Port Augusta to Oodna- datta railway loans taken over from State	8,560,188
Value of properties transferred from States	54,517,545
Total public debt of Commonwealth on June 30, 1919	\$1,585,425,723

In addition, the public debt of the States amounted to \$1,945,335,050, the annual interest charge being on this amount \$76,188,434. Certain debts are included in both Commonwealth and State debts, and when these are deducted the total of Commonwealth and State public debts amounted to no less than \$3,444,379,859, and the total annual interest bill to \$145,768,004.

The debts of the individual States are given below:

State	Redeemable in London	Redeemable in Australia
New South Wales	\$514,138,761	\$228,404,647
Victoria	211,889,659	175,962,541
Queensland	247,520,201	61,904,050
South Australia	118,944,058	99,019,984
Western Australia	148,003,686	57,868,734
Tasmania	47,498,256	25,915,849

The acting treasurer, referring to this debt in the course of his budget speech, said that in considering it it must be remembered that there were valuable revenue-producing assets which had been constructed out of loan moneys. The principal of these were the State railways, water-works, and other public works, which produced in 1917-18 a net income of \$48,425,877. This amount was available for the payment of interest. The States had sinking funds of \$55,707,345, and Commonwealth sinking funds amounted to \$10,240,099, the total being \$65,947,444. The public debt of Australia was being added to from time to time by State borrowing, and would be increased by about \$194,660,000, to be raised by the Commonwealth in 1919-20 for war and repatriation purposes. On the other hand, the Commonwealth borrowings this year would clear off the deferred pay of \$26,765,750 and would enable \$19,466,000 of debt to the Brit-

ish Government to be discharged. The net Commonwealth increase of debt would therefore be about \$148,428,250. In considering the debt to be added in this financial year it was important to remember that the increase would be set off largely by interest earning on reproductive assets. In the case of the States this set-off would represent practically the whole addition to the debt.

PENSIONS. Under the old age and invalid pensions acts, the rates were to be determined at the discretion of the commissioner but the amounts were not to exceed £32 10s a year, or the pensioner's whole income was not to exceed £58 10s a year. Qualifications are: Attainment of 65 years of age and residence in Australian territory for 20 years for old age pensions; and five years residence for invalid pensions. Under the maternity law of Oct. 9, 1912, a bonus paying a maximum of 5 pounds, was allowed for every child of white parents born in Australia. Disbursements for old age and invalid pensions in 1917-18 were £3,793,037. The maternity allowance for 1917-18 was £634,430. Old age pensioners in the Commonwealth on June 30, 1918, numbered 95,387; invalid, 29,112; total, 125,299. War pensioners, 104,602.

COMMUNICATIONS. The table below shows the length and the cost of construction and equipment of Commonwealth and State lines up to June 30, 1917:

State or Federal	Miles open	Cost of const. and equip. £	Gross receipts £	Working expenses £
N. S. Wales	4,437	72,006,621	8,380,084	5,915,360
Victoria . . .	4,123	55,652,275	5,952,719	4,285,456

Total . . .	21,642	214,279,982	28,042,658	17,092,246

GOVERNMENT. The Commonwealth of Australia is a federal state constituting a dominion of the British empire and consisting of six colonies or original States, namely: New South Wales, Victoria, Queensland, South Australia, Western Australia, and Tasmania, and of the Northern Territory which was transferred by South Australia to the Commonwealth on Jan. 1, 1911, and the Federal Territory which on the same date was transferred by New South Wales. Legislative power resides in a federal Parliament consisting of a Senate and a House of Representatives. The Senate consists of six senators from each of the original States, elected for six years; and the House of Representatives consists of twice as many representatives as there are senators, the representation by States being in proportion to population. On the basis of the census of 1911 the Representatives were as follows: New South Wales, 27; Victoria, 21; Queensland, 10; South Australia, 7; Western Australia, 5; Tasmania, 5. The executive power is vested in the King acting through a Governor-General appointed by him, who is assisted by an executive council of responsible ministers. The latter must be members of the federal Parliament. The Governor-General at the beginning of 1918 was Sir Ronald Craufurd Munro-Fer-

guson, G. C. M. G. The coalition War Ministry as reconstituted on March, 1918, was as follows: Prime Minister and Attorney-General, W. M. Hughes; Minister for the Navy, Sir J. Cook; Public Works and Railways, L. E. Groom; Home and Territories, P. McM. Glynn; Postmaster-General, W. Webster; Minister of Defence, G. F. Pearce; Minister of Customs, M. Greene; Treasurer, W. A. Watt; Vice-President of the Executive Council, E. J. Russell; Minister for Repatriation, E. D. Millen; Honorary Ministers, A. Poynton, Mr. Wise, Mr. Orchard.

High Commissioner for Australia in London, Andrew Fisher (appointed Oct. 26, 1915).

There is a Parliament for each of the States, elected in the same manner by universal adult suffrage and having jurisdiction over all matters not transferred by the constitution to the federal Parliament. The executive power in each State is vested in the Governor who is appointed by the Crown and is assisted by a responsible ministry.

HISTORY

INTERNAL DISORDERS. On April 3rd riots were reported at Brisbane, Queensland, in which Russian Bolsheviks were said to have attacked soldiers and police. At this time a secret society was reported to be active in the country for the purpose of spreading Bolshevik views. In the summer of 1919 a series of strikes nearly tied up the industry of the country. It was reported that the Industrial Court was overwhelmed with cases, and to facilitate settlements the government created a new body known as the Government Workers' Tribunal.

PROPOSED REVISION OF THE CONSTITUTION. The question of constitutional revision arose in connection with the discussion of reconstruction. The Commonwealth government had exercised wide powers in war-time and the people were accustomed to the concentration of authority in its hands. On the financial side such concentrations appealed to them as offering the means of effecting economies. Extensive taxing powers had been exercised by the central government, thus drawing on the States' sources of revenue. The quota of 25 shillings per head of population to the States expired in 1920, and the Commonwealth treasurer proposed a scheme for the gradual reduction of the grant. The State governments, finding their revenues menaced, were concerned with plans of readjustment. The central fiscal policy occasioned grievances in several of the States. In Western Australia there were meetings in favor of secession on account of the discrimination against her and in favor of other States; and Tasmania complained that she had been deprived of her shipping. Quarantine regulations following the influenza interrupted inter-State traffic. This raised the question of the States' authority in the matter, in view of the provision in the Constitution for freedom of trade and intercourse among the States. Decisions of the High Court left the question open, and there was a tendency to favor the retention of extensive powers by the central government. Unification of power and a simplification of the constitution was favored in certain quarters, especially among members of the Labor party. On the other hand it was opposed by those who objected to a lessening of popular control and to the extinction of the States' authority.

LABOR UNION DIFFERENCES. The Workers' Industrial Union, commonly known as the "One Big Union," was weakened by internal dissensions and ill supported by the other unions, while from the Australian Workers' Union it encountered a determined hostility. About May 15th the latter published a manifesto rejecting its principles, condemning it as an imitation of the American I. W. W., and calling upon its own members to "devote their time and energy to advocating the principles of industrial unionism on sane lines suitable to Australian circumstances and conditions." The Victoria Railways Union and one or two other large organizations joined it but as a rule the labor bodies were distrustful or hostile, and it was denounced by leaders of the Labor party in Queensland, New South Wales, and Tasmania.

THE ELECTIONS. Returns on December 14th showed the Liberal and Nationalist Labor parties in possession of 35 seats in the House of Representatives and the Farmers' party of 11, all three being supporters of the government, while the Labor and other anti-government groups had secured only 29. William M. Hughes, the Premier and leader of the Nationalists and Liberals, was reelected to the House. See EXPLORATION: INDUSTRIAL WORKERS OF THE WORLD.

AUSTRIA-HUNGARY, formerly the Austro-Hungarian Dual Monarchy, but since November, 1918, only a geographical term, the component parts of the former empire having become divided and independent as indicated below. Previous to these changes the country consisted politically of the Austrian Empire, the Hungarian Monarchy, and the territory of Bosnia and the Herzegovina annexed to Austria Oct 5, 1908. See below under *Government*.

AREA AND POPULATION. Recent figures for the separate states within the limits of the former Austro-Hungarian Monarchy are not available, and the following statistics are based on the census of 1910. The total area of the Dual Monarchy was 261,259 square miles, divided as follows: Austria, 115,882 square miles; Hungary, 125,609 square miles; and Bosnia and the Herzegovina, 19,768 square miles. The total population according to the census of Dec. 31, 1910, was 51,604,464, of which 28,818,928 was in Austria, and 20,886,487 in Hungary; and 1,898,044 in Bosnia and the Herzegovina. The following more recent estimate for Austria is taken from the *Statesman's Year Book* of 1919:

	Area in sq. miles	Population
German-Austria—		
Inner Austria	32,772	6,622,198
German Bohemia	5,049	2,051,103
German Moravia and Silesia...	2,806	647,245
Total	40,127	9,320,546
Bohemia and Moravia (Czech)...	18,705	6,632,484
Polish speaking territory	10,870	3,378,516
Ukrainian speaking territory ..	20,882	5,876,576
Rumanian speaking territory ..	1,979	336,922
Illyria (Southern Slavs)	13,884	2,339,142
Italian speaking territory	2,566	888,773
Trieste	34	190,013
Total ..	107,997	27,962,972

No later figures for emigration and immigration were available than those contained in the last and preceding YEAR BOOKS for the period before the war. About 44 per cent of the total population of the former monarchy was German-

speaking and Magyar-speaking, the rest consisting of diverse races, though for the most part of common Slavic stock. No later figures were available for distribution by language than those given in the last YEAR BOOK, which were based on the census of 1910, but they are repeated here for convenience. They show the population by language in 1910, with the exception of the military in Bosnia and the Herzegovina.

	Austria		Hungary Proper

* Including foreigners, of whom about 300,000 Magyars.

The countries within the limits of the former empire are overwhelmingly Catholic. In the new state religious liberty is one of the fundamental laws. In the territories of the former kingdom of Austria there were seven archbishoprics in the Roman Catholic church and 23 bishoprics. There were also one Greek Ruthenian, and one Armenian archbishopric, and two Greek Ruthenian bishoprics; one Greek Orthodox archbishopric, and two bishoprics. The Protestant church had six superintendents of the Augsburg confession, three of the Helvetic, and one of the mixed. The following statistics date from the census of 1910 and are repeated from the preceding YEAR BOOK. They show the number of Roman Catholic, Greek and Armenian Catholics, Evangelicals, adherents of the Eastern or Orthodox church, Jews, and Moslems (exclusive of the military in Bosnia and the Herzegovina).

	Austria	Hungary	Bos.-Herz.	Monarchy
R. Cath.	22,530,169	10,888,138	434,061	33,852,368

Total ..	28,571,934	20,886,487	1,898,044	51,356,465.

The principal towns in Austria according to the estimates of June 30, 1914, in thousands, are

given in the following table taken from the *Statesman's Year Book* of 1919.

Vienna	2,149.8	Kolomea	45.7
Prague and envi- rons	541.5	Laiibach	43.4
Trieste	246.5	Aussig	40.0
Lemberg	212.0	Drohobycz	40.0
Krakau	171.0	Mährisch Ostrau	39.1
Graz	156.5	Tarnów	38.7
Brünn	131.8	Salzburg	37.3
Czernowitz	94.0	Reichenberg	37.1
Pilsen	84.8	Tarnopol	35.2
Linz	70.9	Stanislaw	34.4
Pola	59.3	Wiener Neustadt	34.2
Innsbruck	57.3	Prossnitz	34.1
Przemysl	57.0	Stryj	33.4
Budweis	46.3	Grz	32.6
		Troppau	32.3
		Trient	31.5

The population of the chief towns in Hungary is shown in the following table taken from the *Statesman's Year Book* of 1919.

Budapest	880,371	Kassa	44,211
Szeged	118,328	Békéscsaba	42,599
Szabadka	94,610	Brassó	41,056
Debrecen	92,729	Nyiregyháza	38,198
Zágráb (Zagreb, Agram)	79,038	Székesfehérvár	36,625
Pozsony	78,223	Kiskunfélegyháza	34,924
Temesvár	72,555	Makó	34,918
Kecskemét	66,884	Szatmár-Németi	34,892
Nagy-Váradi	64,169	Cegléd	33,942
Arad	63,166	Sopron	33,932
Hódmező-Vásárhely	62,445	Mjvidék	33,590
Kolozsvár	60,808	Nagyszeben	33,489
Ujpest	55,197	Szentes	31,593
Miskolcz	51,459	Eszék (Osiek)	31,388
Pécs	49,822	Erzsébetfalva	30,970
Fiume	49,806	Szombathely	30,947
Győr	44,300	Zombor	30,593
		Kispest	30,212

EDUCATION. In both Austria and Hungary elementary instruction is free. School attendance is compulsory in Austria as a general rule between the ages of 6 and 14 and in Hungary between the ages of 6 and 12. In 1912 in Austria there were 23,247 elementary schools with 107,374 teachers and 4,471,393 pupils; children of school age numbered 4,977,724. Secondary education in Austria is provided in the gymnasias and realschulen, of which in 1915-16 the former numbered 376 with 84,907 pupils, and the latter 148 with 44,220 pupils. The gymnasias for girls numbered 40 with 4818 pupils. In 146 of the gymnasias German was the language of instruction; in 73 Bohemian; in 107 Polish; and in 16 Ruthenian. There were 75 lyceums for girls with 10,528 pupils. The seven government technical high schools of Austria with the number of teachers in 1913-14, and the number of students in 1913-14, and in 1915-16 are shown in the following table:

	Teachers		Students	
	1913-14	1913-14	1915-16	
Vienna	183	3,177	639	
Prague { Bohemian	86	900	146	
German	151	2,817	848	
Lemberg	98	1,791	167	
Brünn { German	102	924	115	
Bohemian	73	569	138	
Graz	54	814	80	
Vienna agr. high school	86	1,135	186	
Total	833	12,127	2,314	

There are eight universities in Austria. The number of teachers and students in 1916-17 are shown in the table below:

Universities	Teachers	Students
Vienna, German	638	3,940
Prague { German	174	724
Bohemian	249	2,302
Graz, German	168	858
Cracow, Polish	195	1,854
Lemberg, Polish	186	1,228
Innsbruck, German	115	671
Czernowitz, German	67

Besides these, plans were made for a new university at Salzburg.

In Hungary in 1912 there were 2885 infants' schools with 252,756 infants; the pupils in the elementary schools numbered 2,475,777. Of the school children, 1,083,959 were Magyar. In 1912-13 there were 197 gymnasias with 3877 teachers and 65,554 pupils; 49 realschulen children, with 776 teachers and 11,351 pupils. There were five universities maintained by the state, each with the four faculties of theology, law, medicine, and philosophy, with the exception of the university of Zagrab (Agram) which had no faculty of medicine. The latest figures available for the universities are as follows: Budapest, 429 teachers and 7808 students; Kolozsvár, 156 teachers and 2343 students; Zagrab (Agram), 101 teachers and 1047 students. For the other two universities, namely, those of Pressburg and Debrecen, no figures are available.

FINANCE. In Austria the budget estimates for the fiscal year 1917-18 were given in detail in the preceding YEAR BOOK. The totals are as follows in thousands of crowns. Expenditures, 22,169,662; revenue, 4,194,082. For 1918-19 they were as follows: Expenditures, 24,321,140; revenue, 4,854,789. The provisional government of the republic empowered the minister of finance on Nov. 28, 1918, to supply the deficit in the 1918-19 budget by means of credit operations. The special debt of Austria, Feb. 13, 1918, was 54,081,765,681 crowns, of which 29,274,603,300 crowns were the war debt. The entire interest charged on the total debt was 2,195,106,214. A special debt commission was appointed by the provisional government on Nov. 20, 1918, for the control of the public debt. The war loans of Austria were eight in number and as follows in millions of crowns. November, 1914, 2201; May, 1915, 2688; October, 1915, 4203; May, 1916, 4520; December, 1916, 4467; May, 1917, 5189; November, 1917, 6044; July, 1918, 5763. Total, 35,075.

In Hungary the budget estimates for 1917 18 in thousands of crowns were: Expenditures, 3,442,678; revenue, 4,468,903. The debt of Hungary on Dec. 31, 1916, was placed at 16,170,000,700. Hungary's eight war loans in millions of crowns were as follows: November, 1914, 1175; May, 1915, 1132; October, 1915, 1970; May, 1916, 2000; December, 1916, 2300; May, 1917, 2500; November, 1917, 3600; July, 1918, 3860. Total, 18,537.

ARMY. Figures for the Austro-Hungarian army before the war will be found in the preceding issues of the YEAR BOOK. Exact figures for 1919 were not available, but the following items dating from 1918 and from the period succeeding the armistice give some indications. In the summer of 1918 the regiments of Czechs, Poles, and Ruthenians were ordered to be abolished. The men were to be distributed among other corps in such a manner that the Magyars and Germans would greatly outnumber the members of these nationalities, whose loyalty was doubtful. It

was estimated in June that 40 divisions were engaged in Italy. By July 6th, after the Italian victory, the total casualties were placed at 100,000. In September, 1918, 61 divisions were reported on the Italian front, 15 in Ukraine, 8 in France, and 4 in Albania; and during the October offensive in Italy 63 divisions were reported to

3 battleships, 3 light cruisers, 9 destroyers, 12 torpedo boats, 1 mine-layer, and 6 Danube monitors should be given up to the Allies. The following table showing the chief vessels of Austria-Hungary at the time of the fall of the monarchy is taken from the *Statesman's Year Book* of 1919.

First of class laid down	Name	Displace- ment Tons	Water-line armor, inches	Armor on guns	Principal armament	Torpedo tubes	Indicated horse power	Nominal speed

be engaged. The failure of these operations resulted in loss as prisoners of about 700,000 of all ranks together with 6816 guns, and vast quantities of stores. Upon the signature of the armistice, Nov. 11, 1918, the army was dissolved, and the troops formed parts of the national forces of the new states that arose on the ruins of the empire. In Hungary, after the armistice, a new army of volunteers was organized, the men engaging to serve at least six months, and on March 22, 1919, thirty-six battalions were reported as organized and equipped, and the total forces under arms at that time were placed at 54,000. The casualties during the war were estimated at 4,500,000, including about 1,000,000 killed.

NAVY. The fleet of the Austro-Hungarian Empire during the war was rendered inactive by the blockade of the French, British, and Italian force, but there was some sporadic activity, as for example, the coöperation of cruisers with the army in occupying Montenegro, and some more or less successful submarine operations. Austrian war vessels attempted to check the Italians and Serbs when the former landed in Albania, and when the latter withdrew their army. An extensive operation planned in June, 1918, for the attack upon the Allied fleet from Cattaro as a base came to nothing. Mutinies were reported at Pola, and when negotiations for the armistice were pending, it was said that the government was on the point of handing over the whole fleet at Pola to the new Jugo-Slav state. The distribution of the fleet rested with the Peace Conference. The last serious casualty occurred during the overtures for the armistice when an Italian mine sank the *Viribus Unitis* in Pola harbor. The armistice conditions provided that

GOVERNMENT. The disruption of the old Austro-Hungarian Monarchy began in October, 1918. The independence of Czecho-Slovakia was proclaimed on October 20th, and on October 21st the National Assembly of the Germans in Austria declared their independence, as a German-Austrian state. On October 23rd, Austrian Ukraine proclaimed its independence. On Oct. 30, 1918, the southern Slav states proclaimed their independence at a national council of Slovenes, Croats, and Serbs; and on October 31st, Hungary proclaimed her independence. Within the limits of the former empire therefore, five new states had declared their independence before the close of the year 1919, namely: German Austria, Hungary, Austrian Ukraine, Czecho-Slovakia, and Jugo-Slavia. For the last two, see their respective titles. The ministries are given for Austria and for Hungary for the first part of the year in the two succeeding paragraphs. Further details will be found under *History*.

AUSTRIA. As noted above the National Assembly of the Germans proclaimed the independence of German Austria on October 21st. This was followed on Nov. 12, 1918, by the proclamation of the German-Austrian Republic. Its government was in the hands of a National Assembly which appointed a provisional cabinet and arranged for an election to a National Constitutional Assembly. This election was held on February 16th on the basis of universal suffrage, and the new Assembly, consisting of only one Chamber, was composed as follows: Social Democrats, 70; Christian Socialists, 64; Liberals, 23; others, 5. The ministry appointed by the Constituent Assembly on March 15, 1919, was as follows: State Chancellor and Minister of the Interior, Dr. Karl Renner (Social Demo-

crat); Vice-Chancellor, Dr. Ender (non-party); Minister of Commerce, Dr. Wilhelm Ellenbogen (Social Democrat); Minister of Social Insurance, Ferdinand Hanusch (Social Democrat); Minister for Military Affairs, Dr. Julius Deutsch (Social Democrat); Minister for Socialization, Dr. Otto Bauer (Social Democrat); Minister of Agriculture, Joseph Stöckler (Christian Socialist); Minister of Finance, Dr. J. Schumpeter (non-party); Minister of Justice, Dr. Felix Mayer (non-party); Food Controller, Dr. Johann Löweafeld-Russ (non-party); Minister of Foreign Affairs, Dr. Franz Klein (non-party); Minister of Railways, Dr. Ludwig Paul (non-party).

HUNGARY. The Hungarian People's Republic was proclaimed Nov. 16, 1918, and the Provisional President was Count Michael Karolyi. In place of the two houses of Legislature which were abolished, the new provisional National Assembly was established under pledge to provide by legislation for universal suffrage, secret ballot, freedom of the press and association, the jury system, and apportionment of land among peasants. On March 22nd the Karolyi ministry resigned on account of the attitude of the Allies in regard to the boundary (see below) and was succeeded by a Bolshevik ministry on the platform of a proletarian dictatorship, a military alliance with the Russian Soviet government, and the establishment of Socialism (see below). It was formed by the Budapest Workmen's Council, and after its installation issued proclamations embodying the above programme. It was constituted as follows: President, Alexander Garbai; People's Commissioner for Home Affairs, Eugen Landler; People's Commissioner for Finance, Bela Székely; People's Commissioner for Education, Siegmund Kunfy; People's Commissioner for Foreign Affairs, Bela Kun; People's Commissioner for Agriculture, Eugen Hamburger.

One of its next acts was the abolition of ranks and titles and separation of church and state.

HISTORY

GERMAN AUSTRIA. The newly formed Republic of German Austria transmitted through its provisional government to the diplomatic corps in Vienna a note early in January expressing the hope that it would be recognized by all civilized nations. On February 16th the elections for the National Constituent Assembly were held. In these the Socialists received a vote of 1,210,000 out of a total of about 3,000,000 votes cast; Christian Socialist party, 1,039,000; various groups of German Nationalists, 593,000; the rest cast for pro-Bavarian, Czecho-Slovak and Jewish National factions. The Assembly chose as President Herr Seitz, and the cabinet was appointed on March 15th with Dr. Karl Renner as Chancellor and Otto Bauer as Secretary of Foreign Affairs. The German Nationalists refused to accept portfolios. The policy of the government, in the main conciliatory, attempted to socialize industry, to improve the conditions of the peasantry and bring about coöperation between the productive workers of town and country. In all its policy whether domestic or foreign it was hampered by internal troubles especially owing to the spread of Bolshevik doctrines, and the scarcity of food and unemployment. As a result a revolt broke out in the

spring and early summer, culminating in a great Communist demonstration in Vienna on June 15th. This was put down, but popular discontent still continued. After the terms of the Austrian treaty became known this discontent was intensified. The economic and territorial provisions of the treaty caused great indignation. The plan for the union with Germany had been popular at first but encountered opposition from the Allies and as time went on its advocates began to realize the heavy burdens upon the country which it would involve. Finally the support died down. Diplomatic difficulties with Soviet Hungary developed in July which resulted in the demand that the Hungarian Minister, Czobel, be recalled.

HUNGARY: THE KAROLYI GOVERNMENT. The arrangements with the Allies did not protect Hungary from the aggressions of their Balkan neighbors. The Karolyi government had formed in the closing months of 1918 an armistice with the French general in command fixing a line beyond which no belligerent was to advance. In spite of this agreement the Rumanians and Serbs advanced into Hungarian territory while the Czechs occupied Slovakia and the Danube district. These activities cost Hungary the loss of the Banat region which was important as a source of food supply and she also lost the region containing the coal mines of the north upon which she was depending for her industry. There was much distress on account of the lack of food in the middle of January and popular discontent brought about a crisis in Budapest. It was generally believed that the Karolyi government was incompetent to solve the serious social and economic problems. Moreover Bolshevism was fast spreading. Finally a Communist revolt under the leadership of the extremist Bela Kun broke out with such violence that the government declared martial law and used military force to regain parts of the capital that had fallen into the hands of the revolutionists. The hand of the Karolyi government was not strengthened by the boundaries established by the Inter-Allied Supreme Council between Hungary on the one hand and Rumania, Serbia, and Czecho-Slovakia on the other. They were regarded as most unfair to Hungary. Moreover the intention of the Allies to subject Hungary to military occupation caused trouble. In March discontent was increased by an order issued by the Peace Conference commanding the Hungarians to withdraw to the Rumanian boundary as fixed by the Russian Treaty of 1916 and at the same time a neutral zone was established on the Hungarian-Rumanian frontier, 140 miles long and 40 miles wide, to be occupied by Allied troops. After this came the announcement on March 22nd that the Allied troops had occupied the larger part of Hungary in order to suppress plundering bands of Bolsheviks. Failing in an attempt to secure better terms from the Allies on the one hand and confronted by economic disasters on the other, the Karolyi government saw no prospect of success and on March 22nd Karolyi announced the resignation of his moderate cabinet and at the same time issued a proclamation appealing to the proletariat of the world for justice and support. As noted above under *Government*, a new ministry was immediately formed under Alexander Garbai as President, and Bela Kun as Minister of Foreign Affairs. This new Soviet govern-

ment was entirely dominated by the Bolshevik element, headed by Bela Kun. The change caused much anxiety among the Allies following as it did upon the threat of the head of the German government, Herr Ebert, addressed to the Peace Conference that undue severity would cause Germany to open the door to Bolshevism. Down to that time Count Karolyi had pursued a somewhat advanced Socialist policy tending toward communism. He had decreed the division of the great estates for example. On the other hand, he had opposed with energy the radical communists, who wished to carry out the programme of the Soviet government of Russia. Agents from Moscow had been for some time past engaged in propaganda work in the country. With these Bela Kun was reported to be in sympathy, and by some he was considered one of the chief agents of Lenin. According to Bela Kun the communists aimed at a new revolution and the overthrow of the present government, and had purchased arms and distributed them among the masses. One of the leaders declared that the Russian Bolsheviks arrested at Budapest some weeks before, and later interned by the Allied mission, had 12,000,000 rubles at their disposal. It appeared that the Hungarian communists were in regular communication with the Soviet government of Russia, having a special mail service between Budapest and Moscow, and that they were supplied with Russian money. Russian Bolshevik agents were also reported at Vienna, Agram, and Prague. In turning over the government to this group, the President, Count Karolyi, said he was actuated by nationalist motives. He rejected the territorial arrangement proposed by the Allied mission, and refused to associate his government with an aggressive movement starting from Hungarian territory against the army of the Russian Soviet government. He also protested against the cession to the Czechs of lands formerly belonging to Hungary, and declared that he would appeal from the Peace Conference to the proletariat of the world. In certain quarters where everything that was difficult to explain was attributed to a German plot, this was said to be the result of Herr Ebert's realization that while he could not deliver his own country over to the Bolsheviks, he might threaten the Conference by forcing Austria to take that course. Karolyi's reference to the territorial acquisitions of the Czechs was regarded as a threat that serious results would follow the yielding to the Czechs and Poles at the expense of Germany. In all this the hand of the new German government was seen. The German press declared that the imperialism of the Entente was responsible for this Bolshevik triumph in Hungary, and that the Allies ought to give heed to the terrible warning. This attitude of the press was taken as a sign that Germany was behind the movement. The problems raised by this Bolshevik triumph were serious. The Entente Powers were said to be on the point of taking military measures against Hungary, where two divisions of French troops were already settled. On the other hand, there was difference of opinion in regard to such a course, and it was pointed out that the chief danger was in Russia.

THE BOLSHEVIST REVOLUTION. Hungary thus became a Soviet republic at once and a revolutionary government council proclaimed the

socialization of large properties, mines, large industries, banks, and other commercial institutions; and land reform by means of socialistic production and trade unions. At the same time the government gave assurance that it would enforce an iron discipline with death penalties for all who threatened counter-revolutionary movements. It was announced that proletarian armies would be organized against the Hungarian capitalists and land-owners, as also against the Rumanian enemy, and in conclusion the council declared itself at one with the Russian Soviet government in ideals and in spirit, offered that government a military alliance, sent greetings to the workmen of the Allied Powers, and implored the workmen of the Central Powers to break definitely with Paris and to ally themselves with Moscow. The movement was accomplished with comparatively little trouble. Upon the news of Count Karolyi's resignation in Budapest, troops appeared in the streets and the shops were closed. The troops advised the people to go indoors and this advice was taken. Foreign officers were disarmed and their decorations removed, being informed that distinctions of rank no longer existed. Sailors with machine-guns began to occupy the streets, and detachments of British and French troops were disarmed. The revolutionary government council held its first meeting March 22d, and decided to abolish all ranks and titles, to separate church from state, and to abolish taxes for church purposes. The People's Commissaries for education, agriculture, and finance were called upon to work out a programme at the earliest possible moment and a committee of five was appointed to prepare for the election of Workers', Soldiers', and Peasants' Councils.

In Austria there were signs of warm sympathy with Hungary and among the working classes regret was expressed that, on account of the shortage of supplies and the dependence upon the Allies for food, they were unable to follow the example of Hungary. Early in the revolution a message of greeting was received from Lenin which said the results had been welcomed in Russia with the greatest enthusiasm. In Germany the effect of the news was at first greatly to encourage the extremists. On the other hand it gave the reactionary parties a chance to warn the Allies against driving Germany to extremes.

THE HUNGARIAN SOVIET GOVERNMENT. The Soviet government carried on almost continuous warfare with Rumania, Yugoslavia and Czechoslovakia, all of whom dispatched troops into Hungarian territory. On April 2nd General Smuts was sent by the Peace Conference to Budapest to negotiate a new armistice. In May the Hungarian troops won numerous successes especially against the Czechs, but after an appeal of President Masaryk of Czechoslovakia to the Peace Conference for help, the Allies on June 9th threatened extreme measures to oblige Hungary to cease hostilities. Nevertheless the attacks by Hungary continued and the Allies afterwards attempted to draw a more complete economic and military circle around the country. In the three months following these events a spirit of counter-revolution showed itself throughout the country.

THE FALL OF BELA KUN. Various versions of the downfall of the communist government in Hungary were published, all tinged more or less

by the bias of the writers. An exact report of events was not available. The following account based on the report of travelers agrees in essentials with many others. One of the chief causes of weakness in the new régime was the antipathy to the Jews. In the country districts the feeling was widespread that the revolution had been a movement on the part of the Jews to seize the power for themselves, and the remark was frequently heard that if the Jews of Budapest died of starvation so much the better for the rest of the country. The government of Bela Kun was composed almost exclusively of Jews who held also most of the administrative offices. The communists had united at first with the Socialists who were not of the extremely radical party, but resembled somewhat the Labor parties or the trade unionist groups in other countries. Bela Kun did not, however, select his personnel from among them, but turned to the Jews and constituted virtually a Jewish bureaucracy. This gave rise to a formidable spirit of anti-Semitism, and the Socialists themselves encouraged this spirit. The Jews to avoid odium had themselves baptized in large numbers—some 80,000 in two months it was said. The opinion spread that communism was only a sort of Jewish conspiracy to subdue the Christian world, and the policy of the government did not remove this prejudice, but strengthened it rather by its severe course toward the church. It appropriated church property, secularized the congregations, forbade the wearing of clerical vestments, and threw bishops and other church dignitaries into prison. All of these acts were exploited by their enemies with great effect. For example, it was said that anti-Semites on a religious holiday employed agents to desecrate objects of worship and incite to riot, which acts of violence were then attributed to the government. Then the ministry of Bela Kun pursued an unpopular school policy. It introduced co-education and forbade religious teaching. It was also accused of inculcating lax morality among the young and making marriage and divorce so easy that the result was practically a system of free union. The communists were also accused of preaching the doctrine of free union. Moreover, it was said that pupils were constrained to attend courses in which the doctrines of communism were preached. These mistakes or excesses in the moral domain gave the final blow to the system. So long as communism stayed within the economic field alone, it had sympathy even in conservative quarters where there was resentment against the excesses of the rich classes. But the moment it tried to break up the institution of the family and change the moral outlook of the people it found the masses against it. Thus it fell from power sooner than it would have fallen if it had adhered exclusively to an economic programme, although even in the latter case it was not believed by most observers according to the reports in the press that the system would have lasted long.

GOVERNMENT OF THE ARCHDUKE JOSEPH. At the end of July the Bela Kun government was displaced by the more moderate Socialists under Julius Pedl. The Rumanian troops arrived at the suburbs of Budapest, August 3, and the war minister of the new Hungarian government informed the Rumanian general that the Red army would be immediately disbanded. At the same

time it was given out that the Allies would send a force of 5000 men at the request of the Hungarian government. The communists had made a slight resistance to the new régime and there had been some disturbances in the streets. The newspapers of the Allies saw in this the chance to insure an established and orderly government and declared that the Rumanians were in Hungary as the gendarmes of civilization. The new government sent word to the Conference that it would accept an armistice and asked each of the powers to send a regiment to its aid. The Rumanians declared that they would not occupy the city but would remain in the outskirts. On August 5th, however, it was announced that they had taken possession of the public buildings and assumed military control of the city. The Conference decided to send at once a military commission to inquire into the situation with a view to an armistice. The American members of the delegation were disturbed by the entry of the Rumanians, but the others, especially the French, appeared to be satisfied. The Conference had meanwhile sent an order to the Rumanians to remain outside the city. The latter, whether or not through a misunderstanding, not only disregarded that order, but delivered immediately an ultimatum to the Hungarian government demanding the acceptance by 10 o'clock the next evening (August 6) of the following terms among others: Surrender of 30 per cent of the harvest, farm animals, and farm tools, and 50 per cent of the rolling stock; reduction of Hungarian army to 15,000 men; and the equipment for an army of 300,000 men. This was followed by reports that the Rumanians were requisitioning Hungarian property on all sides and practically stripping the country bare. They were condemned in many of the Allied papers as defying the Conference—in which they had ceased to take part since Premier Bratiano had refused to admit the decision of the Conference in respect to the rights of national minorities. On August 7th a new *coup d'état* was announced resulting in the choice of the Archduke Joseph as governor of state and Herr Friedrich as premier. The Social Democrats had been forcibly expelled and some of them arrested, but there were no public disorders. The Allied mission in Budapest accepted the new government, but there were immediate protests both in and out of Hungary against the return to power of reactionaries. Mr. Hoover, the American Food Controller, for example, issued at once a widely circulated appeal against admitting a member of the Hapsburg family to the head of affairs. Finally even the leading Paris newspapers took this view. Meanwhile the Archduke had declared himself a true Democrat, said he had no intention of becoming king, that he would hold office only till Parliament should express itself after the elections. On August 9th the newspapers announced that the Supreme Council of the Peace Conference had sent notes to M. Bratiano asking Rumania to arrest the advance of her army, saying that the Allies did not recognize her armistice with Hungary, and expressing the hope that she would act in friendly coöperation with the Supreme Council. The attitude of Rumania was attacked in many of the Allied newspapers as showing a cynical indifference to the wishes of the Supreme Council. It was also taken as a sign of the impossibility of setting

up an effective League of Nations. An American newspaper said that nothing showed better the contempt of Europe for a League of Nations than the course taken by Rumania with impunity. The Archduke declared that it was impossible to say whether Hungary would be a republic or a monarchy; and that it was a question for the Constituent Assembly to decide.

FALL OF THE ARCHDUKE'S GOVERNMENT. Finally after many conflicting rumors the Supreme Council dispatched a note to Budapest saying they could not recognize the present government, which had at its head a member of the Hapsburg dynasty that had brought so much suffering to the world. Elections held under such a government would not express the will of the people. The Council called upon the Archduke Joseph to resign. On the following day he and his cabinet resigned.

CONSERVATIVE GOVERNMENT IN HUNGARY. Though the Archduke's government fell, a government was formed by his Prime Minister, Friedrich, who represented the forces of reaction and was accused in the Liberal press of substituting a "White" terror for the Red one. The so-called White army under the command of Admiral Horthy entered Budapest and the Admiral in his address to the mayor declared that he and his followers hated the city for having trod the "Crown and national colors in the dust" but that they would forgive it if it returned "to the Hungarian fatherland and loved once more the Crown and the double cross." The Prime Minister in the presence of Counts Apponyi, Andrássy, and other conservative politicians, publicly thanked the Admiral, who later in an interview with the press declared himself "unreservedly a Royalist." The representative of the Supreme Council of the Allies secured the resignation of Premier Friedrich, and a new ministry was formed under Mr. Huszar, in which Herr Friedrich was war minister. Among its personnel were others identified with Clerical or reactionary interests.

CONDITIONS AT THE CLOSE OF THE YEAR. The Austrian Minister of Railways decided in a conference on December 27th that the passenger trains should cease to run until January 2. This was due to the lack of coal. At the same time the food supply was reported to be low and conditions were said to be growing steadily worse. The country was said to be manufacturing practically nothing and its banks were making serious difficulties which were also increased by the state of the currency. Paper notes were circulating but still depreciating in value. All enterprises owned by the state were said to be showing a deficit. The resources of the country were struggling under the enormous demands made upon them as a result of pensions to the unemployed and the need of food. The peasants were said to be charging enormous prices for their food and to be hoarding their money with the result that the government was required constantly to issue new notes. Great distress prevailed on account of the food shortage. The American Mission of Relief for Children reported that ninety-seven per cent of the children in the schools were suffering from lack of food. **SEE WAR OF THE NATIONS; NAVAL PROGRESS.**

It was announced on December 30th that the Hungarian government intended to make a strong effort in Paris for the recovery of some of the territory that had been taken from them.

A peace delegation was appointed and Count Apponyi was named as its chief. He declared that the Hungarians deeply regretted the withdrawal of America, because the United States had pledged itself to principles which alone could bring about peace in Europe. The delegation intended, he said, to demand a plebiscite in the territories taken from Hungary. Many millions of Hungarians were suffering under the yoke of Rumanians, Serbs, and Czechs, and the delegation would demand that the people in these transferred territories decide their own fate.

THE ALPINE PROVINCES. After the October (1918) revolution in Austria-Hungary, there was a movement in Vorarlberg for absorption in Switzerland. Its opponents were equally adverse to union with Austria, but favored annexation to Württemberg where the same dialect of German is spoken. In 1919 the Vienna government inclined, out of pan-German sympathies, toward the latter group. The same tendency toward union with Germany was manifested in the former Austrian crownland of Salzburg. In both provinces the movement was furthered by the food crisis. In Tirol where the food situation was less acute, there was a tendency toward independence of Austria, but not toward union with Germany except on the part of the Socialists, who represented only about one-fifth of the voters.

AUTHORS' LEAGUE OF AMERICA. The largest organization of authors in the United States, this association was formed to protect their interests and others engaged in the production of books or works of art that are susceptible of copyright. It renders business advice to its members, but does not take legal action. It provides confidential information in regard to publishers, managers, and others engaged in the sale or exhibition of material that is copyrightable.

The seventh annual meeting was on Apr. 8, 1919, at which time a report from the Programme Committee was presented and accepted. An endeavor is being made to increase the individual interest of each member in the League and its work. One of the means suggested was a monthly meeting to be held in New York for the discussion of current literary interests. Further, the League shall assist in the establishing of state and city literary organizations, the nucleus of which shall be a group of League members. It was also suggested that an attempt be made to secure better literary criticism in America, raising the standards of literary criticism and securing for American books the attention undoubtedly due them. To this end a world-wide propaganda, conducted by the League, on behalf of American literature was launched during the past year.

Allied to the League is the Authors' League Fund which was organized by the League, but constitutes a separate corporation. Its object is to furnish assistance to authors and others who are in temporary financial difficulties. The officers of the League Fund in 1919 were: President, Ellis Parker Butler; vice-president, Mrs. Gertrude Atherton; secretary and treasurer, Eric Schuler; honorary counsel, B. H. Stern; honorary accountant, Richard T. Lingley. The officers of the League in 1919 were: President, Rex Beach; vice-president, Booth Tarkington; secretary and treasurer, Eric

Schuler; counsel, B. H. Stern; consulting accountant, Richard T. Lingley.

AUTOMOBILES. The motor vehicle and motor truck industry in 1919 had to experience considerable readjustment, and as in the previous year many plants were engaged more or less, or even exclusively, in war work. As a result it required some time for the various factories to return to the pre-war basis, but they found an active demand for all classes of cars and trucks, and by the end of the year production was going forward on approximately the 1917 rate of about 2,000,000 cars and trucks per annum, the latter amounting to about 12 per cent in the grand total. The production for 1919 was stated at a total of 1,891,929 cars and trucks, which exceeded the previous record of 1,868,000 cars and trucks turned out in 1917, and the value of the product almost reached the stupendous total of \$2,000,000,000.

According to the statistics of the National Automobile Chamber of Commerce American passenger car production in 1919 was slightly less than in 1917, totaling 1,586,787, as against 1,740,000 for 1917. The truck production, however, increased substantially, rising from 227,000 in 1918 to more than 305,000 in 1919.

The total wholesale value of passenger cars was \$1,399,282,995, an average of \$882 per car; while the truck value was \$408,311,585, an average of \$1338 per vehicle.

The total wholesale value of these products was estimated at \$1,807,594,580, which when combined with the wholesale value of bodies, spare tires and accessories to equip the cars or trucks ready for the owners' use brings the industry close to the two billion class. With the increased facilities for production along with the growing demand for motor vehicles of all types it was considered a practical certainty that the motor industry in 1920 would be second only to steel among the manufacturing industries of the country.

The full significance of the importance of the motor vehicle industry in 1919 can best be appreciated by reference to the accompanying comparative statistics:

PRODUCTION FIGURES OF THE AUTOMOBILE INDUSTRY

PASSENGER CAR PRODUCTION		
Year	Number	Wholesale value
1899	8,700	\$4,750,000
1904	21,281	23,684,861
1909	127,781	159,918,506
1914	543,679	413,859,379
1917	1,740,792	1,053,505,781
1918	926,388	801,937,925
1919	1,586,787	1,399,282,995

Average wholesale price for 1919, \$882.

MOTOR TRUCK PRODUCTION		
Year	Number	Wholesale value
1904	411	\$946,947
1911	10,655	22,292,321
1917	128,157	220,982,668
1918	227,250	434,168,992
1919	305,142	408,311,585

Average wholesale price for 1919, \$1,338.

A survey of manufacturing facilities and conditions at the end of 1919 indicated that the capacity of American plants was such that passenger car production in 1920 would be not far from 2,250,000 cars, with truck production 400,000 to 425,000, depending largely on materials, particularly in connection with closed cars, for

which the demand was increasing tremendously.

In 1919 the exports were only \$110,000,000, but this was expected to increase materially as the world's markets were being covered by the automobile industry, American automobiles going in 1919 to 81 different countries, including Iceland, which bought 21 cars and two trucks.

An estimate of 7,602,000 automobile passenger cars and commercial cars officially listed throughout the United States on Dec. 31, 1919 was made, and when compared with 6,225,192 cars at the end of 1918 indicated an increase of 22 per cent. In the year's registrations it was stated that commercial trucks would run but slightly below 300,000. The extent to which the automobile figured in national life is shown by the fact that in 1919 the total revenue from licenses in 48 states and the District of Columbia would amount to over \$50,000,000. In some States the total revenue from licenses goes back to the road while in others it aids materially in their upkeep and extension.

The biggest percentage of increase in the registration of cars during the years 1918 and 1919 was in the agricultural districts. The leaders were Tennessee, Alabama, Louisiana and Georgia, where the percentage of increase over 1918 ranged from 29 per cent down to 16 per cent. New York has the greatest number of cars registered, approximately 570,000, or one for every 18 people in the State. Ohio was second with about 511,000. The distribution of these registration figures as made by the Secretary of State is given in another column.

Nebraska and Iowa practically shared the honor of the greatest number of cars per capita, Iowa with 365,000 and Nebraska 201,000, or one car for every six and one-half persons.

Mississippi had the fewest cars registered, less than one for every 50 persons, with Alabama next—one for every 43 persons.

At the close of the year it was an interesting question, both economic and practical, how many more cars the United States would absorb. There was a normal annual replacement of about 16 per cent of the cars in use, but the demand continued in new sections and new industries. According to competent authority this situation as to just how many cars can be used in the United States depends entirely on the improved roads and bettering the traffic conditions in the big cities by the use of underground garages and parking places for cars not in use. With continued demands and proper roads and facilities, it was thought that within a very few years there would be 12,000,000 motor vehicles running in the United States.

Reference has been made to the supremacy of the State of New York in the number of automobiles as the Empire State in automobiles throughout the country. The year 1919, up to December 1, showed an increase over 1918 of more than 21 per cent in registrations. The total number of cars licensed up to Dec. 1, 1919, was 560,811, the figures for the corresponding date of 1918 being 460,924, an increase of practically 100,000.

Commercial cars showed a 26 per cent increase over 1918, while there was a 23 per cent increase in the number of chauffeurs, the number of licensed drivers footing to 176,466.

It was noticeable that motor cycles showed a decrease of 518 over a year ago. This also

held true in New York City, where the decrease amounted to 91.

In the State as a whole, automobile dealers increased from 2251 to 2661, a gain of 410 or 18 per cent. The number of buses also increased by 23 per cent. The total receipts to the Secretary of State's office from its Motor Vehicle Department reached \$6,000,000 approximately, being \$1,000,000 in excess of 1918, or approximately 20 per cent.

Taking the New York City registration figures separate from those of the entire State, an increase of 35,087, or 36 per cent was shown in passenger cars. The same period brought an increase of 24 per cent in commercial cars. The number of dealers expanded from 645 in 1918 to 813 on Dec. 1, 1919. New York City registered 171,539 motor vehicles in 1919, while its chauffeurs at the end of 1919 number 104,632, as compared with 82,476 on Dec. 1, 1918.

The important part which New York City played in the motor vehicle receipts was revealed in the fact that the 24 per cent increase for 1919 brought the total to \$2,408,889.75, a gain of \$470,445.25 over the same date a year ago.

The accompanying tables give the number of cars, dealers, chauffeurs, and motor cycles on Dec 1, 1919, and on a like date in 1918, with the increase of each:

NEW YORK STATE			
	1919	1918	Inc.
Passenger	440,043	364,050	75,993
Omnibus	21,903	17,862	4,041
Trucks	98,846	74,574	19,272
Trailers	2,359	2,187	171
Dealers	2,661	2,251	410
Total cars	560,811	460,924	99,887
Chauffeurs	176,466	143,789	32,677
Motor cycles	27,988	28,506	* 518
Receipts	\$5,881,623	\$4,906,866	\$974,756

NEW YORK CITY			
	1919	1918	Inc.
Passenger	122,972	97,885	35,087
Omnibus	8,322	6,306	2,316
Trucks	38,479	31,078	7,401
Trailers	653	614	39
Dealers	813	645	168
Total cars	171,539	136,528	35,011
Motor cycles	7,909	8,000	* 91
Chauffeurs	104,632	82,476	22,156
Receipts	\$2,408,889	\$1,938,444	\$470,445

* Decrease.

The deficiencies and failure of transit facilities during the year had a marked effect on the automobile industry and there was an unprecedented demand for closed cars and passenger busses. Realizing this many States inaugurated important road improvements, and this naturally increased the use of motor passenger cars and freight trucks for local or through express service. In regard to the increased uses of passenger busses it may be stated that in Newark, N. J., during the first half of the year 1919, 16,000,000 passengers were so transported and the fares amounted to \$800,000. In Greater New York various municipal bus lines were arranged under city auspices to supplement other transportation facilities.

PASSENGER CAR DESIGN. The tendency in design during 1919 did not involve radical changes but rather contemplated various refinements with consequent improvements to mechanism and bodies. Two reasons readily could be assigned for this situation: first, the condition of the

art of motor car design, which had reached a point of development where radical innovations were neither possible nor desirable; and second, the great demand and the resumption of manufacturing on a pre-war basis where quantity production rather than development was the governing consideration. The designers and manufacturers in 1919 were satisfied to conserve the successful features of their product and in evolving the 1920 models they presented few novelties. The power plants of the cars showed but little change, and the familiar four-cylinder engine continued to enjoy the greatest vogue, with the 6-cylinder engine next. The 8- and 12-cylinder V-engines continued, possibly with a slight tendency to revert to the six-cylinder model, especially where both types had been made. The designers had to take care of the poorer grades of fuel that motorists were forced to accept, so that some improvements were made in carburetors and ignition systems. In this way the engine would run better and an improved intake manifold system was provided. In fact heated gas manifolds were being provided in many of the engines designed in 1919 and along with them in many cases went an automatic water circulation control.

The engines proper in various models were unquestionably improved and perfected, and the tendency towards accessibility and symmetrical and convenient arrangement continued, so that in some power plants all the important elements of the mechanism could be reached from one side. There was noted also a tendency to make the cars easier riding through improved spring arrangement involving better suspension. There was also a tendency towards making the cars lighter by the use of more sheet steel and aluminum. The general appearance of the 1920 model car was that it was low, but this effect usually was secured without sacrifice of clearance space by improved construction where the body is suspended from brackets attached to the chassis frame, and not mounted on top.

MOTOR TRUCKS. During 1919 perhaps the two most salient features of the design, manufacture and operation of motor trucks, were the consideration of the performances of American motor trucks in the war zones of Europe and their regular use on long distance haul to supplant rail traffic. These two functions for trucks of various capacities had been tried out in 1918 before interested and disinterested critics so that any radical defects and consequent opportunities for improvement would have been apparent as new designs were prepared. That there were so few changes is due to the fact that performance in the main was satisfactory, and to the fact that the great demand for motor trucks of all sizes throughout the United States had caused manufacturers to work for maximum output rather than to introduce refinements of details.

In 1919 the motor truck industry of the United States was so organized that it was able to turn out its product with a comparatively small increase in selling price, ranging from about 10 per cent for the three-ton capacity trucks to considerably less for those of lighter capacity with an average of about 5 per cent for all classes.

As stated the developments during the year concerned minor points and the practical performance for long distance hauling indicated

that but few changes were needed. Metal wheels either in the form of steel disks or with cast spokes seemed to become more appreciated and pressed steel was used for the former and semi-steel for the steel spokes. Pneumatic tires of large size were being preferred to solid tires and tended to produce an easier riding vehicle, with a consequent reduction of depreciation on the machinery and a service life that would compare favorably with the solid tire. As a result of the larger use of pneumatic tires mechanical pumps were provided in connection with the engine. With the heaviest trucks cushion wheels are employed with either rubber cushions between felloe and hub or by the use of coil springs. At the end of the year a number of manufacturers of trucks up to 1½ tons capacity were supplying pneumatic tires and in one case a stock model of 3½ tons capacity was so fitted.

It was interesting to note that in 1919 the price of trucks could be figured approximately on the basis of rated capacity and the variation was inversely as capacity. In the smallest capacity class, that is up to one ton, the average price was about \$1 per pound rated capacity. Between 1½ and 3½ tons capacity, 50 cents per pound rated capacity was an average price, while the heavier trucks were selling as low as 25 cents per pound with 33⅓ cents per pound an average price.

During 1919 nearly 100 manufacturers were turning out 1½-ton trucks and 75 makers were offering 2-ton trucks, while 3½-ton capacity trucks were the product of 60 different concerns.

The mechanical developments made in 1919 were rather to carry out tendencies that had developed in practice and consequently in such a review as the present it is perhaps more satisfactory to look at the matter in its larger aspect and to note the features that were entering into the production of trucks that would be on the market in 1920.

The two most important types of drive were the internal gear and the worm gear transmission with a tendency towards the increased use of the former. The chain drive, though used extensively, seemed to be finding less favor. Another interesting mechanical development manifested during the year was the change from three-speed to four-speed gear boxes on trucks of all capacities except the heaviest. The convenience of the low gear and increased power already had been demonstrated in the U. S. army trucks. The four-speed gear box, instead of being mounted as a unit with the engine, was beginning to be placed independent and amidships or at the centre of the truck, and thus had the further advantage of cutting down the propeller shaft length. In the engine proper one of the evident tendencies of the year was to employ detachable cylinder heads so as to reach the valves and pistons readily and remove deposits of carbon. For the various types of motor trucks the four-cylinder engine has been adopted as standard practice and cylinder dimensions and length of stroke do not vary materially in the different models. Thus for a 1½-ton capacity truck the average engine would be of 20 horse power with cylinders of 3½-inch bore by 5-inch stroke. For the 2 and 2½-ton capacity trucks 25 horse power engines would be fitted where the cylinders were 4 inches in

diameter by 5¼-inch stroke. In the 3½-ton class there was used a 32 horse power engine with bore of 4¼ inches and stroke of 5½ inches, while the heavier trucks would run engines of some 40 horse power where the cylinder was 5 inches diameter and stroke 6 inches.

In the motor truck as on pleasure cars, self-starters and electric lighting has been found desirable and necessary and such equipment was another feature of 1919 production. The motor truck manufacturer and designer was forced to take into consideration the deteriorating quality of gasoline with fractions that did not readily vaporize at the carburetor. According, a hot-spot manifold was employed where the exhaust gas heats a hot plate against which the entering mixture impinges. This tended to prevent condensation and the passing of unconsumed fuel into the sump where it would dilute the lubricating oil. The control of the cooling water by a thermostat was also one of the developments of the year as it not only prevented over cooling but assisted in the more complete utilization of low volatility fuels.

ARMY MOTORS. One of the questions actually discussed during the year was the large supply of motor trucks that had been made for the U. S. army for shipment to France, but which were not required owing to the cessation of hostilities. A number of these trucks were turned over to other departments of the government and made available for highway construction, but there were a considerable number assembled at various centres and it was claimed in many cases not properly protected from the weather. During the latter part of the year a number of sales of government motor cars and trucks were held at various points, but there was criticism as to deterioration resulting from the delay, and the limited amount of the offerings.

In 1919 the exports of motor vehicles were greater than in any previous year, even of the war years, when large numbers of commercial motor vehicles were being shipped to Europe for use in the war area. The value of motor vehicles and parts thereof, including tires and engines, exported in the calendar year 1919 aggregated approximately \$185,000,000, as against \$140,000,000 in the fiscal year 1916, the former high record; \$38,000,000 in the fiscal year 1914, all of which immediately preceded the war; \$11,000,000 in 1910; \$2,500,000 in 1905, and slightly less than \$1,000,000 in 1902, the first year in which automobile exports were considered of sufficient importance to justify a separate statement in the government record of merchandise exported. Of the \$185,000,000 worth of automobiles and parts thereof exported in the calendar year 1919, \$35,000,000 worth were commercial cars; \$75,000,000 worth, passenger; \$41,000,000, parts of automobiles; nearly \$30,000,000 worth tires, and about \$5,000,000 worth of automobile engines.

The total number of commercial automobiles sent to France in the calendar year 1919 was about 3600, valued at over \$15,000,000; though for passenger machines the demand from France is comparatively small, the total for the calendar year 1919 aggregating less than 1000 and the value but about \$2,000,000. Great Britain, which took large numbers of American commercial machines during the war period, in 1919 was apparently manufacturing them for herself, for the total value of commercial machines

sent to that country fell from \$20,000,000 in 1917 and nearly \$7,000,000 in 1918 to only about \$500,000 in 1919. About 750 motor trucks valued at nearly \$2,000,000, as against 557 in 1918, valued at about \$1,000,000, were exported to Cuba.

In the detailed statement for 1918 it was stated that 60 countries and colonies took American commercial machines in 1918, and the number of countries taking passenger machines was 80. Iceland took in 1918 40 passenger machines at a value of \$34,000, and one commercial machine, valued at \$2245. To Siam the number of passenger machines exported in 1918 was 85 at a value of \$75,860; to India 72 machines valued at \$70,254 and 11 commercial machines valued at \$22,000. To the far-off Dutch East Indies the United States exported in 1918 no less than 1260 passenger machines valued at \$1,567,766 and of commercial machines 154 valued at \$335,536, while the figures for the calendar year 1919 indicate a total of about 2000 machines valued at approximately \$2,500,000.

The imports of automobiles into the United States, which have aggregated \$31,000,000 since the first record, that of 1906, have declined from the high-water mark of \$3,837,000 in 1910, to \$524,709 in 1919.

RACING EVENTS Tommy Milton was the leading automobile race driver in 1919, a year in which this sport came back into its own after being handicapped badly by the World War. Milton gained victories in the 22-mile and 112-mile races at Uniontown, Pa., and won the 10-mile events, sprint, and match race, at the Sheepshead Bay track, New York City. The Indianapolis 500-mile race went to Howard Wilcox.

The famed Ralph de Palma established several straightaway records for short distances at Daytona, Fla., but these were not accomplished in competition.

The winners of the principal racing fixtures of the year were:

Indianapolis, 500 miles, Howard Wilcox; Elgin National, 301.48 miles, Tommy Milton; Los Angeles-Phoenix, 671 miles, Tommy Oldfield; Santa Monica, 250.24 miles, Durant.

AUTOTHERAPY. This method of treatment continues to develop and while it must not be elevated to the questionable dignity of a system for the treatment of the totality of disease, it is so well suited both as a resource for diagnosis and treatment of individual affections that opportunities for its employment should be sought rather than shunned. To illustrate, in *La Presse Médicale* for Oct. 18, 1919, Weill of Lyons relates some remarkable results from the injection of mother's milk beneath the skin of babies who suffer from intolerance to the milk. Strictly speaking this is not autotherapy but would doubtless so be classed in very young babies nursing their own mothers. The idea can also be extended to the use of cow's milk in infants intolerant to that fluid. In these cases it is possible to produce a specific reaction in the infant's skin by inoculating the latter very superficially. A positive result will indicate that the milk is at fault in the given case, not because of any defect in itself but as a result of that form of sensitization known technically as anaphylaxis, which means supersensitiveness. Injection of a few centimeters of the milk which disagrees with the infant's digestive apparatus and skin will have an opposite or antidotal ef-

fect and after an isolated injection of the milk, which should be heated to about 110° Fahrenheit, will cause the disappearance of the symptoms in a very short time. The result, moreover, is apparently permanent and hence the author terms it a genuine vaccination; for not only are the actual symptoms relieved but the infant can thenceforth ingest the milk which once disagreed with impunity. The variety of symptoms which has yielded to this simple resource is so great that the author is inclined to employ it largely as a routine measure in obstinate affections of young babies.

BACON, ROBERT. Diplomat, died May 29. He was born at Boston, Mass., July 5, 1860, and after graduating at Harvard, 1880, entered the banking business. He was a member of the firm of J. P. Morgan and Company from 1894 to 1903 and later succeeded Elihu Root Secretary of State. From 1909 to 1912 he was ambassador to France. During the war he was assigned to the staff of General Pershing in France. He was long known to be a close student of foreign affairs and his position among diplomats was a high one. Besides membership in various important bodies he was an overseer of Harvard University from 1899 to 1908.

BADEN. Formerly a grand duchy of the German empire; now a state with a republican form of government, constituting part of the new German republic; bounded by Bavaria on the east, and the Palatinate and Alsace-Lorraine on the west, with an area of 5819 square miles, and a population (1910) of 2,142,833, estimated in 1914 at 2,229,100. According to the census of 1910 there were 1,271,015 Catholics and 826,364 Protestants. Capital, Karlsruhe, with a population (1910) of 134,313; largest city, Mannheim, with a population (1910) of 206,049. Instruction is compulsory and the elementary schools are supported by the communes of the state. No recent statistics are available. The elementary schools in 1912-13 had 6075 teachers and 351,008 pupils. Secondary and special schools include realgymnasias, realschulen, realprogymnasias, normal schools, agricultural schools, etc., and there are two universities having in 1914, 338 members on the teaching staff, and 5846 students. Of the area 55.4 per cent was reported under cultivation, and 39.4 per cent under forests. The principal crops include wheat, barley, rye, potatoes, wines, tobacco, etc.; and the chief manufactures are tiles, jewelry, machinery, clocks, chemicals, musical instruments, cotton tissues, etc. Revenue and expenditure for 1917 and 1918 were reported as balancing at £19,143,228. Formerly the executive power was vested in the grand duke, and the legislative in a representative assembly or Landtag of two houses. In November, 1918, the grand duke abdicated and Baden was proclaimed a republic under a provisional government. On Jan. 15, 1919, a national assembly was elected on the basis of equal, secret, direct, and universal suffrage for all persons over 20 years of age, and voted a constitution. By this Baden was constituted a republic and a component state of Germany. Privileges based on birth and caste were abolished; women obtained the same rights as men; church and state were kept separate; the initiative and referendum were introduced and also proportional representation, and the suffrage was conferred upon all adults 21 years of age. The

not being accompanied by a corresponding increase in the productive capacity of the country, were chiefly expended in driving up wages and prices, in a highly competitive demand for labor and materials. For other material relating to this subject the reader is referred to the following articles: AGRICULTURAL CREDIT, FINANCIAL REVIEW, NATIONAL BANKS, SAVINGS BANKS, STATE BANKS, and WAR FINANCE.

An idea of the great increase in the banking resources of the United States during recent years may be gained from a statement made near the end of the year 1919 by the National City Bank of New York, one of the most prominent of the banking institutions in the country. This bank's resources amounted to about \$1,028,000,000 on November 17th, the first time that a bank in the Western Hemisphere has shown assets above the billion mark. This did not include the resources of the International Banking Corporation, owned by the National City Bank, which amounted to \$109,000,000. During the year 37 new foreign branches were opened by the two institutions, bringing their total number of branches up to 75. The first foreign branch of the National City Bank was opened at Buenos Aires a little more than five years before—Nov. 10, 1914.

FEDERAL RESERVE SYSTEM. The great strength and value of the Federal Reserve System, only five years old on Nov. 16, 1919, were more apparent than ever before during the year 1919, the current trade and industry of the country being financed without interruption in spite of the unusual conditions of expansion arising out of the period of readjustment following the war. Unusual additions to the country's stock of gold had increased the gold holdings of the Federal reserve banks from \$315,977,000 on Nov. 19, 1915 to \$2,201,804,000 on June 6, 1919, when they touched the highest point reached up to this time. On Nov. 21, 1919 they stood at \$2,119,315,000. The decline in gold holdings was in great measure due to the termination of the gold embargo on June 9 (originally put in operation Sept. 7, 1917), after which gold was exported from the country much more freely. Loans and investments, however, continued to increase despite the decline in gold reserves, and the Federal Reserve Board found it necessary to issue warning that in the interest of security and stability to industry the expansion of credit must be checked, by paying up the bank loans secured by government paper, and by conducting business in accordance with the facilities supplied by the present volume of credit.

The cessation of hostilities did not end the war work of the banks, the 1919 activities of the entire reserve system continuing undiminished in scope and volume. According to the weekly statement of the Federal Reserve Board on December 26th, "loan operations for the government in close harmony with the Treasury, involving the flotation of the several issues of loan and tax certificates, continued to be one of the leading, if not the leading function of the Reserve Banks." This involved the collection, concentration, and disbursement on government account of \$15,659,000,000 of which \$4,491,500,000 represents the total of Victory Loan allotted, \$6,754,400,000 represents the combined amounts of eight series of certificates issued during the year in anticipation of the Victory Loan and of four series of so-called loan certificates, and \$4,413,

600,000 represents the total of 11 series of certificates issued in anticipation of income and excess profits taxes due in 1919 and 1920. On May 16th, at the consummation of the Victory Loan, war paper constituted 91.4 per cent of the total discounts held by the Federal Reserve banks, the maximum for the year; on December 26th the proportion was 68.8 per cent.

The activities of the Federal Reserve Bank in curbing speculation on the stock exchanges are discussed under FINANCIAL REVIEW.

RESERVE BANK STATEMENT. According to the consolidated statement issued on Dec. 26, 1919, aggregate resources of the 12 Federal Reserve Banks were \$6,325,000,000. This was an increase of \$1,073,000,000 or about 20 per cent during the year, and the total was more than six times the aggregate in 1916. Total reserves were \$2,135,000,000, a decrease of \$11,000,000 during the year. In the reserves were included a total of \$2,078,000,000 in gold, which show a decrease of \$12,000,000 during the year. This gold was distributed as follows: Gold coin and certificates, \$229,445,000; gold settlement funds, \$352,785,000; with foreign agencies, \$134,320,000; with Federal reserve agents, \$1,240,032,000; gold redemption fund, \$121,850,000. The total earning assets of the 12 banks aggregated \$3,080,000,000, an increase of about 25 per cent during the year. In this item were included discounted bills secured by government war obligations, amounting to \$1,510,000,000; other discounted bills, \$684,514,000; United States securities, \$300,405,000. Of aggregate liabilities, the chief items were as follows: Capital paid in, \$87,339,000; government deposits, \$72,357,000; Federal reserve notes in actual circulation, \$3,058,000,000; due to members, reserve account, \$1,787,000,000; and deferred availability items, \$822,680,000. The total deposits showed a gain of 20 per cent over 1918, and the total amount of Federal reserve notes in circulation was about 14 per cent greater than in 1918.

As was indicated above, the gold reserves did not keep pace with the expansion in note circulation; the ratio of total reserves to Federal reserve notes in circulation after setting aside 35 per cent against net deposit liabilities was 50.3 per cent as compared with 59.7 per cent in 1918. The ratio of total reserves to net deposits and Federal reserve note liabilities combined was 44.8 per cent as compared with 50.6 per cent in 1918 and 61.8 per cent in 1917.

The reserve bank of the second district (New York) continued to be by far the most important bank of the 12. Its total gold reserves on December 26th were \$570,438,000, or about 22 per cent of the system's total; it had bills discounted and bought to the amount of \$979,506,000; and it held deposits due to members on reserve account of \$706,254,000. Its earnings of \$28,000,000 for the year represent 130 per cent on its paid-in capital. The Chicago bank, in the seventh district, was again the second most important, with total gold reserves of \$372,355,000 bills discounted and bought, \$383,621,000; and due to members on reserve account, \$253,864,000. In the order of their importance the others were: Cleveland, San Francisco, Boston, Philadelphia, St. Louis, Richmond, Kansas City, Atlanta, Dallas, and Minneapolis.

One indication of the growth of the system is the increase of \$6,658,000 during the year in the amount of paid-in capital. The largest rela-

tive gains in paid-in capital are recorded in San Francisco, Chicago, and Kansas City; the largest increases in number of banks admitted to membership were in San Francisco, Chicago, and Cleveland.

RESERVE ACT AMENDMENTS. The so-called "Edge bill," amending Section 25 of the Federal Reserve Act, became a law in December. The essential features of this act are that corporations having a capital of not less than \$2,000,000 may be organized to engage in foreign banking business, that they may sell debentures or other obligations to the amount of 10 times their capital, and that national banks may subscribe to the stock of such corporations provided that their total holdings in these and other corporations of similar kind shall not exceed 10 per cent of their capital and surplus. This act, it is hoped, may rally the European exchange situation, and brave hopes were entertained for its success, which would ultimately depend on the desire of the investing public for such securities as the act creates.

FOREIGN BANKS. A comparative statement of the principal items of the resources and liabilities of the Bank of England is as follows (000's omitted):

	Dec. 3, 1919	Jan. 2, 1919
Gold coin and bullion.....	£91,342	£79,976
Reserve notes and coin.....	18,442	28,236
Circulation.....	91,349	70,189
Public deposits.....	19,213	26,306
Other deposits.....	180,637	214,893
Government securities.....	92,469	124,305
Other securities.....	106,777	106,472
Proportion of reserves to liabilities.....	9.20%	11.70%
Bank rate.....	5%	5%

In the next to the last week of the year the proportion of reserves to liabilities was 11.51 per cent, which at that time was almost the lowest of the year; then came a further loss of gold holdings, bringing it to the low record of 9.20 per cent.

The statement of the Bank of France shows the following (000,000's omitted):

	Jan 1, 1920 Francs	Jan. 2, 1919 Francs
Gold—In France.....	3,601	3,449
Gold—Abroad.....	1,978	2,037
Silver.....	266	316
Bills discounted.....	1,655	1,862
Advances.....	1,507	1,251
Note circulation.....	37,661	31,055
Treasury deposits.....	76 (Dec. 25)	34
General deposits.....	2,370	1,392

The note circulation in the above table may be compared with 17,001,000,000 francs on Jan. 4, 1917 and with 6,683,000,000 francs just before the war broke out. This remarkable note expansion was an important factor in the war finance of the country.

The gold holdings of other leading European state banks on Jan. 1, 1920, in pounds, were as follows: Germany, £54,480,650; Russia (Oct. 29, 1917), £129,650,000; Austria-Hungary, £10,944,000; Spain, £96,895,000; Italy; £32,200,000; Netherlands, £53,110,000; Switzerland, £20,650,000; Sweden, £15,647,000; Denmark, £11,787,000; and Norway, £8,143,000. The principal increase in gold holdings in Europe was in the Bank of England, about £12,000,000; Germany showed a loss of about £60,000,000.

BAPTISTS. The Baptists are divided into

three main groups: the Northern Convention, the Southern Convention, and the National Convention (colored). The Northern Convention reported the following figures for 1919: 9101 churches, 8346 ordained ministers, 1,285,416 church members, 8203 Sunday schools with 951,450 pupils. Total contributions from the churches for all purposes were \$16,331,618. The church maintained 8 theological seminaries, 9 missionary training schools, 22 colleges and universities, 9 junior colleges, 28 academies and 16 schools for the negroes, 4 others scattered. The war activities of the church were under the control of the War Commission of the Northern Baptist Convention. This Commission had a secretary in the field and placed a large number of men in the camps. Funds for this work were voted by the Home Mission Society and by contributors of the churches. During 1919 the National Committee of Northern Baptist Laymen assumed the responsibility of raising the missionary and evangelical funds of the church. The campaign was successful in securing the sum of \$6,000,000 for missionary work. The denomination is now engaged in the programme of raising \$100,000,000 in the next five years for its missionary and educational work and is co-operating with the Inter-church World Movement to this end.

The Southern Baptist Convention reports the following figures for 1919: 24,373 churches, 17,308 ministers, 3,023,674 members, 18,894 Sunday schools, 1,698,898 pupils, total contributions, \$15,828,882. Fifty-eight colleges and universities, and two theological seminaries are maintained.

The National Baptist Convention (colored) reports the following figures for 1919: 20,151 churches, 17,398 ordained ministers, 2,735,007 members, 16,500 Sunday schools, 822,618 scholars, total contributions, \$1,097,771. Two schools are maintained.

Other smaller Baptist organizations are: General Six Principle Baptists, Seventh Day Baptists, Free Will Baptists, Free Will Baptists (colored), Free Will Baptists (Bullockites), General Baptists, Separate Baptists, Regular Baptists, United Baptists, Duck River and Kindred Associations (Baptist Churches of Christ), Primitive Baptists, Colored Primitive Baptists, and Two-Seed-in-the-Spirit Baptists.

BAPTISTS, FREE This denomination has ceased to exist as a denomination, having completely united with the Baptist Church during the year. Its missionary work and denominational activities were taken over by the three national mission organizations of the Northern Baptists: The American Baptist Foreign Mission Society, the American Baptist Home Mission Society, and the American Baptist Publication Society. This union was effected in 1911, and complete financial arrangements were made in 1919.

BARBADOS. The most easterly of the Caribbean Islands, a British colony, lying to the west of the Windward Islands, with a length of 21 miles and a breadth of 14 miles, and an area of about 166 square miles. The population in 1911 was 171,982, and, estimated, Dec. 31, 1917, 186,656. Capital, Bridgetown, the chief city and port with a population (1911) of 16,648. The latest available figures for revenue, expenditure, exports and imports in pounds sterling were as follows:

	1915-16	1916-17	1917-18
Revenue	\$212,484	\$311,113	\$399,969
Expenditure	227,009	242,605	456,808
Imports *	1,270,154	1,851,054	2,285,278
Exports *	1,058,380	2,267,257	2,190,114

* Including bullion and specie, but the exports exclude bunker coal (£251,583 in 1917).

Public debt in 1917-18 was £538,900. The executive power is vested in a governor with an executive council and an executive committee, and the legislative in a Legislative Council of nine members appointed by the King, and a House of Assembly of 24 members elected by the people. The governor at the beginning of 1919 was Lieut.-Col. C. R. M. O'Brien.

BAR ASSOCIATION, AMERICAN. An organization having for its purpose the advancement of the science of jurisprudence, the promotion of the administration of justice and uniformity of legislation, and the upholding of the honor of the legal profession. The forty-second annual meeting was held in Boston, Mass., on Sept. 3, 4, 5, 1919, with President George T. Page presiding. Mr. Page opened the meeting with an address of welcome, after which he introduced Viscount Finlay, ex-Chancellor of Great Britain. Viscount Finlay spoke about the cordial relations existing between the American and British bars, and how each had played an important part in the war. He called to mind several incidents in American History where, despite prejudice, justice had always reigned supreme. Hon. Elihu Root then spoke about the principles of "democracy, the liberty, and unalienable rights of individuals, for which the struggle between England and America a century and a half ago was fought, and in which the liberty of England and America both won." Dr. David J. Hill of New York spoke on "The Nations and the Law." Among the resolutions presented and passed were the following: Approval of the act to make uniform in all States the law of Conditional Sales, and the law of Fraudulent Conveyances; to continue "our organized opposition to judicial recall." A lengthy discussion on the subject of court-martials took place, but the matter was finally turned over to the executive committee for consideration. Other speeches given before the meeting were: "The New Constitution of the United States," by Robert L. Batts; "The Power of Congress to Tax States' Securities under the Sixteenth Amendment," by Albert C. Ritchie; "Some Legal Questions of the Peace Conference," by Robert Lansing. The Secretary's report showed 10,995 active and 15 honorary members at the date of publication of the 1918 Report. Since then there have been 437 deaths and resignations, and 465 new members were proposed, all of whom were elected by the executive committee. There are 38 State Bar Associations affiliated with the American Bar Association. The Treasurer's report showed \$13,194 in assets. The *American Bar Association Journal* is the official organ of the organization. The minutes of the annual meeting are published in book form. The officers in 1919 were: President, George T. Page, of Peoria, Ill.; Secretary, George White-lock, of Baltimore; Treasurer, Frederick E. Wadhams, of Albany, N. Y.

BARLEY. According to data published by the International Institute of Agriculture, Rome, the recovery in barley culture in 1919 for the countries reporting was not very marked. An

increased acreage as compared with 1918 was recorded only for Denmark and Great Britain and as compared with the average for the five years 1913 to 1917 for Spain, Great Britain, Norway and Switzerland. In production Great Britain, the Netherlands, and Rumania showed an increase over the preceding year and an increase over the five-year period was secured only in Spain and Switzerland.

The chief barley-producing countries and their yields in 1919 in addition to the United States were as follows: Japan, 87,837,000 bushels; Spain, 85,465,000 bushels; Canada, 63,700,000 bushels; Great Britain, 49,576,500 bushels; and Algeria, 32,327,000 bushels. Data for most of Central Europe and Russia and for the southern hemisphere were not reported. The United States in 1919 as estimated by the Department of Agriculture produced 165,719,000 bushels as against 256,225,000 bushels in 1918. The area devoted to barley was reduced from 9,740,000 acres in 1918 to 7,420,000 acres in 1919, which was less by 360,000 acres than the average area for the five years 1913 to 1917. This reduction in barley culture was due mainly to the large increase in the wheat acreage and the prohibition placed on the use of cereals for the manufacture of intoxicating beverages as war measures.

The average yield was 22.3 bushels per acre or 4 bushels under the average yield of 1918, and 3.3 bushels less than the five-year average for 1913 to 1917. The average weight per measured bushel for the year was estimated at 45.2 pounds as compared with 43 pounds, the legal weight, and 46.5 pounds, the average for the 10 years 1910 to 1919. On Dec. 1, 1919, the average price paid farmers was 120.9 cents per bushel against 91.7 cents on the corresponding date the year before and 72.4 cents the average for the five-year period 1913-17. At 120.9 cents per bushel the total value of the 1919 crop reached \$200,419,000 or \$34,523,000 less than the value of the 1918 crop but \$56,177,000 above the average for the five-year period mentioned.

In the United States over 85 per cent of the barley crop is harvested in July and August. Of the portion of the crop used for feeding ordinarily about 60 per cent is fed to swine, nearly 18 per cent to horses and the rest to cattle and poultry. At the close of the year barley rose in price on the European market to unusually high figures and sold in England for near \$3 per bushel.

BARNARD COLLEGE. See COLUMBIA UNIVERSITY.

BARNES, GEORGE NICOLL. British representative at the Paris Peace Conference. He was born in Scotland in 1859. He became Member of Parliament for Glasgow in 1906, and gained a reputation in the House for his straightforward conduct and his wide knowledge of labor conditions. In several successive Parliaments he was a recognized leader of the Labor party. During the war he loyally supported the national cause and was appointed by Mr. Lloyd George Minister of Pensions in the second Coalition Cabinet. He replaced Mr. Henderson in the War Cabinet as a member without portfolio, after Mr. Henderson's retirement on account of the Stockholm affair.

BARNEY, SAMUEL STEBBINS. Judge and member of Congress, died at Milwaukee, Wis., December 31st. He was born at Hartford, Wis.,

Jan. 31, 1846, and was educated at Lombard University. He taught in the high school of his native town and was admitted to the bar in 1873. He was superintendent of schools from 1876 to 1880, and delegate to the Republican National Convention in 1884, and a member of Congress from 1895 to 1903. After 1906 he was Associate Justice of the United States Court of Claims.

BAROTSELAND. See RHODESIA.

BARR, AMELIA EDITH. Author, died in New York City, March 10th. She was born, March 29, 1831, at Ulverston, England, and married Robert Barr in 1850. She went to Texas in 1854 but removed to New York in 1869 where she devoted herself to writing. Her novels are very numerous and the best of them deal with historical incidents with scenes laid in Scotland, the North of England and Dutch New York. The list of her writings includes 75 titles, among which may be mentioned the following: *Romance and Reality* (1872); *Jan Vedder's Wife* (1885); *A Daughter of Fife* (1886); *A Bow of Orange Ribbon* (1896); *Friend Olivia* (1891); *Birds of a Feather* (1893); *The Lone House* (1894); *Bernicia* (1895); *A Knight of the Nets* (1896); *Trinity Bells* (1899); *The Maid of Maiden Lane* (1900); *Souls of Passage* (1901); *The Lion's Whelp* (1901); *The Black Shilling*, *The Belle of Bowling Green* (1908); *The Strawberry Handkerchief* (1908); *The Hands of Compulsion* (1909); *The House of Cherry Street* (1909); *Sheila Vedder* (1911); *Playing with Fire* (1914); *Measure of a Man* (1915); *Profit and Loss* (1916); and *Orkney Maid* (1917).

BARRELL, JOSEPH. Geologist, died at New Haven, Conn., May 4th. He was born at New Providence, N. J., Dec. 15, 1869; studied at Lehigh and Yale; engaged in mining and geological work in the West, and in 1900 became professor of geology at Lehigh University. He also served as mining engineer to several mining corporations. In 1903 he was called to Yale and became a professor there in 1908. He was widely known for his researches in physical geology, particularly isostasy, erosion and sedimentation. For an appreciation of his work, see *Science*, June 20th.

BARRY, THOMAS HENRY. American general, retired, died in an army hospital near Washington, D. C., December 30th. He belonged to the so-called "Old Guard" of higher officers in the regular service. He was born in New York City, Oct. 13, 1855, graduated at West Point in 1887, and served at once in the Indian Wars in the Dakotas and Montana. He advanced rapidly in rank and in 1897 was appointed major and assistant adjutant-general and during the Spanish War he was adjutant-general of the 18th army corps. He served in the Philippines where he was chief-of-staff and he was also an officer in the China relief expedition. He became major-general April 29, 1908, in reward for his excellent work in cooperation with Governor Magoon in Cuba. He was superintendent of the United States Military Academy from 1910 to 1912, and in 1914 was sent to the Philippines as commander of all the American troops in the islands. In 1916 he was placed in command of the Central Department with headquarters at Chicago and upon the formation of the draft army he took command of the 86th division at Camp Grant, Rockford, Ill. He was one of those who on account of physical disability was kept at home

on duty, being regarded as physically unfit for service in France.

BARZILAI, SALVATORE. Italian representative at the Paris Peace Conference. He was born in Trieste of Jewish parentage, and was at an early age identified with the Irredentist agitation. Passing over to Italy he became a member of the Republican party and was elected to the Chamber where he showed unusual talent as a speaker. He was a minister without portfolio in the Boselli cabinet, and a member of the parliamentary committee that organized the Congress of Oppressed Nationalities at Rome.

BASEBALL. The professional baseball season of 1919 was the most successful in the history of the national game from a financial standpoint, much to the surprise of the club owners who feared that post-war conditions would not be favorable to this branch of sport. So skeptical were the magnates that they shortened the major league schedule from 154 games to 140 at the annual winter meeting.

As the season went along the constantly increasing attendance proved that the public after the stress and strain of war was turning to this form of recreation for relief and relaxation. The action of the New York State Legislature in enacting a measure permitting Sunday ball in Greater New York also had its effect in the way of larger gate receipts. A third reason for the prosperity of baseball in 1919 was the closeness of the pennant races in the two big leagues.

The financial success attending baseball during the year, however, was powerless to quell the dissatisfaction felt in some quarters with the manner in which the controlling powers of the game conducted affairs. Byron B. Johnson, the president of the American League, was the special target of certain club owners who resented what they considered his high-handed and arbitrary methods. The storm broke toward the close of the season when Johnson suspended Carl Mays, a pitcher secured from the Boston Club by the New York Club.

Col. Jacob Ruppert and Col. T. L. Huston, owners of the New York Club, or Yankees, secured an injunction from the court restraining Johnson from interfering with the playing of Mays as a member of the New York team. This move led to several others of a legal nature and a war in the courts followed which is still continuing. Supporting the New York Club which is avowedly seeking the removal of Johnson from the presidency of the league are Harry Frazee, owner of the Boston Americans, and Charles A. Comiskey, owner of the Chicago Americans.

For the first time since 1914 a National League team won the world championship, the Cincinnati Reds led by Pat Moran, accomplishing the feat at the expense of the Chicago White Sox after a series of eight games. All previous records for receipts were smashed in this series, although the attendance fell a bit behind the mark set by the Giants-Red Sox contests in 1912. The total receipts for the world series in 1919 were \$722,414, exclusive of war tax. The attendance for the eight games was 236,928.

The first game was played at Cincinnati on October 1st, the Reds winning by a score of 9 to 1. The fine pitching of "Dutch" Reuther, for Cincinnati, and the heavy hammering his team mates gave Eddie Cicotte, the Chicago twirler, were the outstanding features. The scores of the other games follow:

October 2d at Cincinnati—Cincinnati 4 runs, 4 hits, 1 error; Chicago 2 runs, 10 hits, 2 errors; Batteries, Sallee and Rariden; Williams and Schalk.

October 3d at Chicago—Chicago 3 runs, 7 hits, 2 errors; Cincinnati 0 runs, 3 hits, 4 errors. Batteries, Kerr and Schalk; Fisher, Luque, and Rariden.

October 4th at Chicago—Cincinnati 2 runs, 5 hits, 2 errors; Chicago 0 runs, 3 hits, 2 errors. Batteries, Ring and Wingo; Cicotte and Schalk.

October 6th at Chicago—Cincinnati 5 runs, 4 hits, 0 errors; Chicago 0 runs, 3 hits, 3 errors. Batteries, Eller and Rariden; Williams, Mayer, and Schalk, Lynn.

October 7th at Cincinnati—Chicago 5 runs, 10 hits, 3 errors; Cincinnati 4 runs, 11 hits, 0 errors. Batteries, Kerr and Schalk; Reuther, Ring, and Rariden.

October 8th at Cincinnati—Chicago 4 runs, 10 hits, 1 error; Cincinnati 1 run, 7 hits, 4 errors. Batteries, Cicotte and Schalk; Sallee, Fisher, Luque and Wingo.

October 8th at Chicago—Cincinnati 10 runs, 16 hits, 1 error; Chicago 5 runs, 9 hits, 1 error. Batteries, Eller and Rariden; Williams, James, Wilkinson, and Schalk.

According to the composite score the Cincinnati Reds outthit their opponents .255 to .224, while the Chicago White Sox had a slight edge in fielding with .965 as against .963.

Tyrus Raymond Cobb of the Detroit Tigers once more captured the batting honors in the American League, while Eddie Roush of the champion Cincinnati Reds was the topnotcher with the stick in the National League. The most effective pitcher in the American League was Walter Johnson of the Washington Club, and in the National, Grover C. Alexander of the Chicago Cubs.

The final standing of the clubs in the National League was:

Cincinnati, won 96, lost 44; New York, won 87, lost 53; Chicago, won 75, lost 65; Pittsburgh, won 71, lost 68; Brooklyn, won 69, lost 71; Boston, won 57, lost 82; St. Louis, won 54, lost 83; Philadelphia, won 47, lost 90.

The final standing of the clubs in the American League was:

Chicago, won 88, lost 52; Cleveland, won 84, lost 55; New York, won 80, lost 59; Detroit, won 80, lost 60; St. Louis, won 67, lost 72; Boston, won 66, lost 71; Washington, won 56, lost 84; Philadelphia, won 36, lost 104.

The pennant winners in the more important minor leagues were:

International, Baltimore; American Association, St. Paul; Southern Association, Atlanta; Pacific Coast League, Vernon; Eastern League, Pittsfield; Western League, St. Joseph; Three I, Bloomington; Texas League, Fort Worth; South Atlantic League, Columbia.

Among the American colleges Holy Cross had the strongest nine, completing a schedule of some 30 games with only one defeat.

BASHFORD, JAMES WHITFORD. Methodist Episcopal bishop, died at Los Angeles, Cal., March 18th. He was born at Fayette, Wis., May 29, 1849; graduated at the University of Wisconsin in 1873; and after teaching in the university was ordained to the ministry in 1878. He was pastor in Boston and Auburndale, Mass., Portland, Me.; and Buffalo, N. Y.; and was president of the Ohio Wesleyan University from

1889 to 1904, when he was elected bishop. He was a leader in organizing missionary work in China and in 1907 he took part in the promotion of relief measures. He was a delegate to the World's Ministry Conference at Edinburgh in 1910. He was the author of the following books: *Outline of Science of Religion* (1891); *The Awakening of China* (1906); *China and Methodism* (1907); *God's Missionary Plan for the World* (1907); *China—An Interpretation* (1916); and *Oregon Missions* (1918).

BASKETBALL. The basketball championship of the intercollegiate league was won for the second time in succession by the University of Pennsylvania quintet, but no trophy was awarded the winner because of the unusual conditions existing as a result of the war. Mike Sweeney of the Pennsylvania team was the leading scorer for the season's play. Yale captured second place in the final standing, Cornell, Princeton, and Columbia following in order.

BASS, JOSEPH PARKER. Publisher, died at Bangor, Me., March 27th. He was born at Randolph, Vt., in 1835; was educated in the common schools, and entered the dry goods business in Lowell, Mass. He afterwards went into business for himself and removed to Bangor in 1863, where after 1879 he engaged in publishing work and organized the J. P. Bass Publishing Company. He was mayor of the city of Bangor in 1873; held other important offices in the city, and at the time of his death was director of the Second National Bank.

BATES COLLEGE. A non-sectarian institution at Lewiston, Me., founded in 1864. In the fall of 1919 there were 494 students; in the summer school, 70; while there were 40 members in the faculty. The productive funds of the institution amount to \$1,107,000. The library contains 46,356 volumes. In the fall of 1919 Chase Hall was dedicated, in memory of George Colby Chase, who was for more than 50 years connected with Bates, and died when president, in May, 1919. Chase Hall is to serve as a social centre for all the men of the institution, and is one of the finest of its kind in the country. On November 29th, Rev. Clifton D. Gray was elected third president of the college; he will assume office in May, 1920, being inaugurated in the following month, during Commencement Week.

BATTLE, KEMP PLUMMER. University president, died at Raleigh, N. C., February 4th. He was born near Louisburg, N. C., Dec. 19, 1831; graduated at the State University in 1849; was admitted to the bar in 1854; practiced law for more than 20 years, and was prominent in the politics of South Carolina. From 1876 to 1891 he was president of the University of North Carolina and was professor of history from 1891 to 1907, after which he was professor emeritus. He wrote histories of the university, the Supreme Court of the State, the city of Raleigh, and other historical monographs.

BATTLESHIPS AND OTHER WAR VESSELS. Each war of recent times has differed from others which have gone before in scope, character, and centre of effort. The results of the operations have not therefore been conclusive on more than a few points; and in most cases, the test of war has done little but confirm the conclusions of peace. The special conditions under which the operations of each war are carried out naturally produce new types (in many

cases of temporary value) or such variations in existing types as will fit them to the work in hand. In the recent war there were developed the British and Italian so-called *monitors*, the *Q-ships*, *seaplane carriers*, *coastal motor boats*, *submarine chasers*, *eagle boats*, and *mine-laying submarines*; while the *battle cruiser*, the *mine-laying cruiser*, the *destroyer*, the *mine-sweeper*, and the *submarine* were developed in certain directions. The effect of the war on types of war craft is hereinafter considered under the separate heads of *Battleship*, *Battle Cruiser*, etc.

ARMORED CRUISER. This type of war vessel, fully discredited before the war, has been finally condemned as a result of war experience. The features of the type were: (a) armor of less than half the thickness of that on contemporary battleships; (b) guns of 6- to 10- inch caliber; (c) speed of 3 or 4 knots more than that of contemporary battleships; (d) displacement of half to two-thirds that of battleships. The increase of speed of battleships and of light cruisers rendered the older armored cruisers obsolete and the advent of the battle cruiser did the same for the later types. During the war armored cruisers proved to be well-nigh useless, particularly the British types which were fitted with guns of ridiculously light caliber, many of them mounted so low as to be useless except in smooth water.

BATTLE CRUISER. This type of warship, in which armor protection is largely sacrificed to secure very high speed, is still undergoing development, brought about in part by the increased speed of battleships. Whether the type will persist is seriously questioned; but something between the fast light cruiser and the battleship seems inevitable and at present the battle cruiser appears to be the most satisfactory solution. A considerable portion of naval opinion inclines toward a very fast battleship of 27 or 28 knots with as much protection—above and below water—as can be given. This, its advocates contend, replaces the heavy battleship and the battle cruiser. Its opponents hold that it does neither—that it cannot successfully oppose the heavily protected battleship nor act efficiently against large and fast light cruisers. During the war the British laid down (1915) and completed (1916) the battle cruisers *Renown* and *Repulse*. The vessels have a displacement of 27,500 tons at a mean draft of 25 feet 6 inches. The length over all is 794 feet; beam, 90 feet. The armor on the side amidships is 6 inches; on the barbettes, 7 to 4 inches; on the turrets, 11 to 7 inches. The speed is 32 knots with 120,000 indicated horse power; and the main battery, 6 15-inch guns in the three turrets, one forward, two aft, and all on the centre line. Except as to length, draft, and battery, they differ but little from the *Lion* and *Tiger* classes. About the same time the mammoth cruisers *Courageous*, *Glorious*, and *Furious* were built. The first two carry 4 18-inch guns. The displacement is 18,600, on a mean draft of 22 feet 3 inches; length, 786.25 feet; beam, 81 feet. The side armor is 3 inches; on the barbettes, 7 to 3 inches; on the turrets, 9 to 7 inches. Light as this armor is, that on the *Furious* is somewhat less, being only 7 inches on the turrets. The displacement is 19,100 on a mean draft of 21 feet 6 inches; length, 786.5 feet; beam, 88 feet. The horse power of all three is 90,000, and the speed 31.5 to 32 knots. After the battle of Jutland the

Hood and one or two others of her class were commenced. Only the *Hood* was very far advanced when the war closed and she alone is to be completed. While by some she is regarded as a battle cruiser, she is properly classed as a high-speed battleship and typifies the ideas of the advocates of the combined battleship and battle cruiser. (See paragraph on *Battleships* below.) The U. S. battle cruisers of the *Constitution* class are the highest development of the battle cruiser idea. The displacement is 43,500 tons on a mean draft of 31.3 feet. The length is 850 between perpendiculars; beam, 105.4 feet. The speed is 35 knots with a horse power of about 180,000. The main battery consists of eight 16-inch guns in four turrets. Since the modification of the original plans the details of the armor protection have been changed, and the arrangements at the close of the year were still withheld from publication. Reports from Japan stated that the Japanese government proposed to build two battle cruisers of 40,000 tons; no further details at the close of the year had been published.

BATTLESHIPS. The majority of naval men, particularly in the U. S. navy, doubt the practicability of the very fast battleship. The American idea has always been to build ships in which battery power was the most important feature, protection against enemy attack the second, and speed the third. A fleet of such ships should prove invincible to an equal number of faster but weaker ships. To attain adequate speed and protection has usually necessitated an increase in size. The new U. S. battleships of the *Massachusetts* class exemplify the American idea fully. They carry the heaviest batteries afloat; against attack by gun, torpedo, or aerial bomb they are the best protected ships in the world. To secure these desirable ends with a speed of 23 knots, a normal displacement of 43,200 tons was found necessary. The length is 684 feet over all; beam, 106 feet (110 feet is the width of the locks in the Panama canal). The main battery consists of 12 16-inch guns. The hull and gun positions are heavily armored while along the sides, over the decks and elsewhere there is much interior armor to secure the ships against attack by torpedoes, bombs, and high angle fire of distant guns. Other nations have built and are building ships on the same general principle but, as they are much smaller, they are correspondingly weaker in armament and protection; and in many cases there is some sacrifice of battery or protection to attain a higher speed than could otherwise be reached. As mentioned in the paragraph on battle cruisers the new British battleship *Hood* exemplifies the views of the fast battleship advocates as to efficient combination of the essential qualities of a battleship and battle cruiser. This remarkable ship is of 41,200 tons displacement, 2000 tons less than that of the *Massachusetts* class. Her length between perpendiculars is 860 feet (10 feet more than the *Constitution*), her beam is 104 feet, and her mean draft, 28.5 feet. Her main battery consists of eight 15-inch guns. Her side armor is 12 inches; barbettes, 12 inches; turrets, 15 to 11 inches. She has three armored decks 2 inches, 1.5 inches, and 1 inch thick; also armored bulkheads and other internal armor. As a defense against torpedoes, in addition to armor, her beam is increased about 10 feet to contain a wall of compartments along

the sides from the water line to the turn of the bilge. It must be admitted that the design is a clever combination of speed, battery, and protection. But she is so far inferior in fighting power to a ship of the *Massachusetts* class that the issue of a fight between them should be decided in a few salvos.

BLISTER SHIPS. The first of the ships to carry this title were old British cruisers which had fitted to their sides a bulging structure of timber to act as a protection against the explosion of a mine or torpedo. In later ships this bulging structure was built into the hull and consisted of a large number of small compartments of steel plating. Such bulges or blisters are a characteristic of the "monitors." Vessels were frequently hit by torpedoes on their blisters and these excrescences are said to have saved them from sinking in every case.

COASTAL MOTOR BOATS. These were a variety of very fast motor boats used by the British in the anti-submarine, anti-destroyer work. They were of a modified hydroplane type with torpedo slides in the stern. In attack, the torpedo engine was set going and the torpedo slid into the water. The high speed of the boat enabled it to gain on the torpedo until well ahead; the helm was then put over and the path of the torpedo left clear.

DESTROYERS. In this war the power of the British battle fleet was the deciding factor. The next most important naval weapon on the side of the Allies was the destroyer. At the commencement of hostilities, the British destroyer flotilla, numerous as it was, proved to be wholly inadequate to the necessities of the situation. With characteristic energy and determination, the building of new and more powerful boats was prosecuted with the highest practicable speed. But the usefulness of the destroyer in new rôles, particularly in anti-submarine and convoy work, made still farther demands upon the limited numbers. The early British boats—and nearly all the French—were too small for efficient open sea work so that, notwithstanding the constant addition of new boats, this part of the destroyer service was much overworked until the coming of the American flotilla of 40 boats in May, 1917, and even then was far from adequate. The U. S. navy began to build destroyers in large numbers in 1917 but only 33 of the new craft had reached Europe before the close of hostilities. Had the United States entered the war a year earlier, there would have been 250 destroyers in Europe at its close. Both in England and the United States a displacement of 1000 to 1200 tons was the approved destroyer displacement in 1914 and the experiences of the war confirmed the efficiency of this size. The later types, however, were given increased speed so that recent boats in both countries attained about 40 knots while one American boat reached 41. The advantage of larger boats as flotilla leaders was early appreciated and 38 such craft (mostly of 1600 to 1800 tons) were added to the British navy during the war or immediately afterward.

EAGLE BOATS. The length of time required to build a destroyer, its cost, and the urgency for a more powerful patrol boat than the submarine chasers led the United States navy to contract with Mr. Henry Ford for the building of 110 small destroyers of a design (500 tons, 18 knots speed) which would lend itself to rapid produc-

tion and would not add to the burden already laid upon shipbuilding establishments of the country. The unexpected early termination of the war prevented the use of these boats in operations against the enemy but three or four were completed and undergoing trial at the close of hostilities; the contracts for 50 of the 110 were canceled.

MINE-LAYING CRUISERS AND SUBMARINES. Previous to the outbreak of war most mine-layers were small vessels of moderate speed or old gunboats or cruisers refitted as mine-laying ships. The control of the sea by the British compelled the Germans to lay mines by stealth except along their own shores. To accomplish this they built mine-laying cruisers of 4000 tons with a speed of 32 to 34 knots. Each carried 360 mines. For laying a few mines at a time in enemy waters, they devised small mine-laying submarines that carried 12 to 18 mines in inclined tubes extending through the after part of the hull from deck to bottom.

MONITORS, BRITISH AND ITALIAN. At the outbreak of the war the British navy purchased from Brazil three light-draft *river monitors* which had just been completed in England. These were found to be so useful for shoal work that many other light-draft vessels were built—also called *monitors* but differing considerably in design. In all, 35 were built. Fourteen (*M15 to M28*) are of 540 tons, have a speed of 10 to 12 knots, a draft of 7 feet, carry 1 9.2-inch and 1 3-inch gun in armored shields. Five of about 350 tons and 10 knots speed draw 5 feet of water and carry 2 6-inch guns and 1 6-pounder. The three boats built originally for Brazil were of 1280 tons, 5.5 feet draft, 12 knots speed, and carried 3 6-inch and 2 4.7-inch guns behind shields. These 22 vessels were of quite low freeboard, not much greater than that of American monitors; the others were high freeboard and much larger. Four of 6150 tons, 320 feet length, 90 feet beam, and 10.5 feet draft, carry 2 14-inch guns which were built in the United States for the Greek battleship *Salanis* (under construction in Germany) and seized *en route* by the British. Eight of 5900 tons and 7 knots speed carry 2 12-inch guns (taken from British predreadnought battleships) and 1 6-inch. They are 325 feet long, 87 feet broad, and draw 10.5 feet of water. Two of them, in 1918, were fitted with a single 18-inch gun on the deck aft. These 18-inch pieces were originally built for the *Furious* and removed when she became a sea-plane carrier. The speed is 6.7 knots. Two monitors of 6670 tons and 6 knots speed carry 2 15-inch and 8 4-inch. The length is 355 feet, beam 90 feet, draft 10.5 feet. Two of 8000 tons, and 14 knots speed are armed with 2 15-inch and 2 6-inch (or 8 4-inch?). The length is 405 feet, beam 88 feet, draft 11 feet. The large monitors carry their heavy guns in a single turret over a high barbette and the guns have high angle fire and very long range. The armor on the barbettes is about 10 inches thick, that on the turrets 10 to 13 inches; the belt and side armor is 2 to 6 inches. The small monitors have some slight hull protection. All the monitors have large "bulges" or "blisters" on their sides subdivided into a large number of air and water chambers. While these give practical immunity against torpedo attack they made the ships difficult to steer and reduce the speed to 2 or 3 knots in a moderate head sea. The British

monitors were used with great success on the Belgian coast, in the Mediterranean and in South Africa, where their light draft enabled them to place their heavy guns close in to the shore. The Italian monitors were of a different kind. Five of the *Monfalcone* type were built. The hull is a raft-like structure with sides only a few inches above water and the armored deck inclined upward in a gentle slope to the midship line. The turret on its barbette rises high above the hull and carries 2 15-inch guns on a high-angle mounting. One or two search-lights, 4 14-pounder guns, and some lighter pieces are fitted. The principal service of the vessels was on the coast of Italy in the vicinity of the mouth of the Piave River where they interfered seriously with the advancement of the Austrian left flank.

Q-SHIPS. These vessels were ordinary small freight steamers on which were mounted concealed guns. They were manned by British naval officers and seamen and were designed to act as decoys to submarines. The appearance was that of an ordinary "tramp" steamer and the officers and men wore civilian clothes. If torpedoed or fired upon by a German submarine they stopped at once. A "panic" party, ostensibly the officers and crew, left the ship in one or two boats while the rest of the ship's force lay in hiding ready to man the guns when a favorable opportunity offered. In almost every case the submarine approached closely and rose to the surface to complete the sinking by gunfire. When everything was as favorable as it was likely to be the guns were manned and fire opened on the submarine. In most cases the latter was sunk, and the Q-boat eventually sank if torpedoed. The necessity of keeping concealed on a sinking ship and of lying perfectly quiet while the ship was being shelled by the submarine as she approached led to many instances of extreme heroism.

SEAPLANE CARRIER. On land the military scouting plane has taken the place of cavalry for scouting purposes and does the work infinitely better. At sea, the naval seaplane has almost displaced the cruiser scout. But there are no airplane stations at sea so one must be provided. This is the seaplane carrier, a large vessel with a flying deck from end to end on which seaplanes may land or from which they may take off. In all navies battleships and large cruisers will in future carry one or more planes but until further developments, returning planes cannot land on a battleship nor in the water alongside except under favorable circumstances. This makes a vessel with a suitable landing deck a necessary auxiliary in the train of every important naval force. Such vessels are now under consideration in all navies and the British have built two—the *Argus* and *Furious*—and another, the *Eagle*, is under construction. The *Furious* is simply a very large light cruiser with a flying-deck fitted above. The others have two practically clear decks from stem to stern—the upper or flying deck absolutely clear. Beneath the flying deck is the hangar deck for the stowage and repair of planes. The *Eagle* and the *Argus* can each stow about 20 planes. These are raised and lowered to and from the flying deck by hoists large enough to take any standard British seaplane with the wings partly folded back. To clear the upper deck and prevent the formation of eddy currents that might disturb the seaplane in landing, the smoke pipes are led aft

below the hangar deck and discharge smoke and hot gases beyond the stern.

SUBMARINE BOATS. Since the close of the war we have obtained exact knowledge of the German boats and their operations and this enables us to form a definite opinion as to the sphere of usefulness of the submarine and of its qualifications and limitations. Some naval officers, government authorities, and writers on naval matters advocate abolishing the submarine and forbidding its use in war. The futility of such a prohibition is shown by the German disregard of almost every article of The Hague Conventions for ameliorating the brutalities of war. It has been argued that if the Allies failed to punish drastically the Germans for their brutal and inhuman conduct such failure would be a direct invitation to any other nation which was similarly without honor, humanity or shame to break any international covenants which might be made on this or any other subject. Properly employed, the submarine has a wide range of usefulness and is not likely to be given up—unless aircraft are developed to a point that is not now in sight. At present there is of course a temporary check in submarine building due to the reaction incident to the great cost of the war but much thought is still being given to submarine design and as the various navies are no longer pressed for time to meet a definite condition, new ideas are likely to have ample investigation and trial. Now that we know the difficulties under which the German submarines operated we cannot help being thankful for the strict blockade which kept building materials out of Germany's ruthless hands for, with an ample supply of them, she might have succeeded in her inhuman warfare on noncombatants. So scarce had the necessary materials become that in 1918, 23 German ships—several pre-dreadnoughts, 5 cruisers of the *Hansa* class, the light cruiser *Strassburg* and 15 other vessels—were broken up to obtain brass, copper, steel plating, and other structural material and fittings for submarine construction. At the outbreak of war Germany had less than 30 submarine boats ready for service and when the ruthless campaign was commenced (Feb. 1, 1917), there were not much more than 100. In April, 1917, there were 126; in July, 134; in October, 146; in December, 137; in January (1918), 133; in February, 136; in April, 128; in June, 113. Only a small percentage of the boats were actually engaged at any one time. In January, 1917, when circumstances were favorable, 12 per cent were actively engaged, 30 per cent in port refitting, resting, or undergoing repairs, 38 per cent undergoing trial, and 20 per cent incapacitated. All the foregoing figures were furnished by Captain Persius (German naval critic) in articles published since the close of hostilities. Captain Persius also confirms the accuracy of the table of submarines destroyed which was given out by the British Admiralty. The total number destroyed by the Allied forces during the war was 202. In 1917, the losses were 66 and the new boats placed in service 83. At the same time many boats not lost were incapacitated for a long time, some wholly so. Not only was it difficult to obtain material for new boats but construction was much slower than was generally believed to be the case. At the close of hostilities, 170 boats were building but they were not being completed fast enough to replace

losses. From various sources we conclude that about 556 boats were placed under construction before or during the war and about 386 were completed. Of the latter, about 184 were surrendered, or disarmed and ordered broken up. Nine (possibly 10) U-boats were destroyed by American war vessels and 36 others damaged. The convoy system of defense against submarines was an unqualified success, not only as a means of protecting the merchant ships but as a means of destroying the U-boat. As the convoying craft (especially the destroyers) increased in number and the unconvoyed sailings were decreased the U-boats were further and further forced into attacking convoys or becoming a mere futile menace. So well were most of the later convoys protected that the dates of sailing were in some instances actually given out to induce the U-boats to attempt an attack and thereby expose themselves to destruction. The total number of ships convoyed after the institution of the system was 85,772, of which 433 or 0.51 per cent were lost. The U-boats' daily toll of ships decreased steadily from 10.43 during the second quarter of 1917 to 2.91 in the third quarter of 1918. And at this time destroyers were being produced at a rate that would soon have left few ships without adequate convoy. Of the fighting ships destroyed by U-boats, none (except the *Audacious*—if she was a U-boat victim, which is doubtful) was of great naval value. The most important losses were pre-dreadnoughts and obsolete armored or other cruisers which escaped being relegated to the scrap-heap or to early retirement from service by the exigencies of war—which can usually find some use for any ship with engines and hull in good condition. It therefore seems strange to read of Rear-Admiral Sir Percy Scott's recent reiteration of his pre-war prophecy that the submarine had driven the battleship from the sea (see *NEW INT. ENCYC.*, vol. xxii, p. 356), as well as all other surface vessels. As a matter of fact the German U-boats not only failed to break the blockade of the German coast but they even failed to mitigate its stringency. Indeed, no blockade in the history of the world has been so effective. A few German commerce raiders slipped through it both ways by the use of neutral waters but no commercial blockade-runners ever passed in or out through the cordon of surface ships and the submarine itself was eventually reduced nearly to impotence as a war factor before hostilities ceased. The improvement in anti-submarine warfare—the convoy system, the depth bomb, the hydroplane, the aeroplane, and the development of the destroyer, the submarine chaser, the coastal motor boat, the Q-boat, and the patrol boat—has met the submarine in more difficult fields than were contemplated by Admiral Scott and has unqualifiedly defeated it. The submarine still remains a useful and dangerous weapon of war, but it no longer occupies the commanding position at one time claimed for it by its advocates—not Germans, who used it in outrageous defiance of humanity and honorable warfare, but advocates who desired its employment in legitimate fields only. As a useful war vessel the submarine is still undergoing development. The Germans did a good deal to improve its power and reliability but effected no radical changes. The stories of submarine cruisers of mammoth size and terrifying character were myths designed to encourage

the flagging faith of the German people and if possible to terrorize the Allies. No such vessel was ever built—probably nothing of the kind was seriously considered. Most of the German boats were of 900 tons or less. None equalled those of the British K class in size or speed. The most noteworthy peculiarity of the German boats was the size and number of guns. The largest of their late boats carried light 6-inch pieces of moderate muzzle velocity. The British submarines built during the war are of seven classes. Of these the most numerous were the E class, the number of which may have approximated 50. The submerged displacement of these boats is about 800 tons and the surface tonnage about 660; the corresponding speeds are 10 and 15 knots. The armament consists of 1 3-inch gun and 5 18-inch torpedo tubes. Of an F class we have no record. The G class, 10 in number, 975 and 700 tons, speeds 10 and 14 knots; armament, 1 3-inch gun, 5 18-inch tubes. The H class, 10 in number, were small boats of 500 tons. There were about 15 of the J class: tonnage, 1820 and 1210; speeds, 9.5 and 19 knots; armament, 2 3-inch or 1 4-inch and 6 18-inch tubes. The 21 boats of the K class are the largest ones built: tonnages 2650 and 1880. The propelling machinery is composed of steam turbines of 7200 horse power for high speed surface propulsion and an oil engine of 800 brake horse power which drives a dynamo furnishing current for charging the batteries or operating the main motors when cruising on the surface at low speed. The high surface speed is 24 knots, the submerged speed 9. The armament is 1 4-inch gun, 1 3-inch, 8 18-inch torpedo tubes. The 8 or 9 boats of the L class are smaller—1070 and 890 tons; speeds, 17.5 and 10.5 knots; armament, 1 4-inch and 6 18-inch torpedo tubes. The experimental boat *M-7* (about 1700 tons when cruising) is remarkable for carrying a short 12-inch gun. The largest American submarines are those of the A-4 fleet submarine class, though boats of a still larger class are to be built. The tonnages of the A-4 class are 1460 and 1220 tons; speeds, 20 and 10 to 12 knots; armament, 1 4-inch gun; 1 3-inch anti-aircraft piece; 8 torpedo tubes. The coastal type (S class) of which 50 are built or building, have a submerged displacement of 913 to 1000 tons and a surface displacement of 800 to 854 tons. The corresponding speeds are 12 and 15 knots. The surface cruising radius is 10,000 miles at 11 knots. The armament is 1 4-inch, 1 anti-aircraft gun, and 4 to 6 tubes. There are 27 boats of the R class (700 to 740 tons submerged), 16 of the O class (600 to 673 tons), 7 of the N class (430 tons), 11 of the L class (600 tons), 8 of the K class (520 to 530 tons), 9 of the H class (430 tons), and 4 of the G class (458 to 540 tons); the other small boats were all completed before 1914.

See SUBMARINES, also SUBMARINE AND ANTI-SUBMARINE OPERATIONS in the YEAR BOOK for 1918.

BAUM, LYMAN FRANK. Author and playwright, died at Los Angeles, Cal., May 6. He was born at Chittenango, N. Y., May 15, 1856; went into the newspaper business in 1880, and edited papers in South Dakota and Chicago. He wrote *Mother Goose in Prose* (1897). This was followed by a long series of humorous and extravagant tales including the *Wonderful Wizard of Oz*, (1900) which was turned into a musical extravaganza under the title of the *Wizard*

of Oz and won him a wide reputation. It was produced in Chicago in 1902 and was at once an extraordinary success. The list of his writings are too numerous to quote here but after 1914 he wrote the *Scarecrow of Oz* (1915); *Rinktink in Oz* (1916); *Babes in Birdland* (1917), and the *Tin Woodman of Oz* (1918).

BAVARIA. Formerly a kingdom forming a part of the German empire, but after November, 1918, a state with a republican form of government in the new German republic. Area, 30,346 square miles with a population (1910) of 6,887,291, including the Palatinate, whose area is 2372 square miles, with a population (1910) of 937,085. Nearly half of the population were gathered in towns with more than 2000 inhabitants in 1910. The chief cities are Munich, with a population of 596,467 in 1910, estimated at 606,014 at the end of 1912; Nuremberg, with a population of 333,142 in 1910, estimated at 359,529 at the end of 1912, and Augsburg with a population of 102,487 in 1910. In the census of 1910 the Roman Catholics comprised 70.61 per cent of the population, and the evangelicals 28.21. In 1914 the leading crops with their acreage and their yield in metric tons were as follows: Hay, 3,223,457 and 4,979,250; oats, 1,272,895 and 904,337; rye, 1,391,397 and 708,483; wheat, 730,242 and 446,359; potatoes, 945,700 and 4,372,844. The vine acreage in 1917 was 39,807, and the yield 9,321,466 gallons. The live-stock June 1, 1917, was: Horses, 272,667; cattle, 3,896,702; sheep, 616,464; pigs, 1,184,788; goats, 469,533. The budget is voted for two years. In each of the years 1918 and 1919 the estimates of the ordinary budget balanced at 852,791,912 marks; and the extraordinary budget at 28,779,676.

Down to November, 1918, the executive power was vested in the king whose crown was hereditary, and legislative power in the king and parliament which consisted of two houses, the upper, comprising the royal princes, archbishops, and other dignitaries, along with 18 life members appointed by the Crown, and the Lower House of 163 members elected for three years by direct vote. The king down to the closing months of 1918 was Ludwig III, born Jan. 7, 1845. The revolutionary movement at the time of the armistice overthrew the government and set up a republic under the provisional government, whose constitution was made public on Jan. 7, 1919. According to this, supreme power was vested in the people, and the Diet, consisting of one chamber was to be elected by universal, equal, direct, secret, and proportional suffrage; privileges of birth and caste were abolished; the church was separated from the state; and religious associations were to have equal rights and freedom of action. Upon the abdication of the dynasty the government was assumed by the Socialist leader, Kurt Eisner. One of the first acts of the revolution was to cut off all relations with the government of Berlin. See GERMANY.

BAYLOR UNIVERSITY. A co-educational institution conducted under the auspices of the Baptist General Convention of Texas, at Waco, Texas. In the fall of 1919 there were enrolled 614 women, and 510 men, and there were 56 members in the faculty. The endowment of the university is \$504,734 and the income for the year was \$293,571. The library contains 37,906 volumes. Baylor was founded in 1845,

and came under the present control in 1886. President, Samuel Palmer Brooks, LL.D.

BEAUX-ARTS, ECOLE DES. Celebrated national school of fine arts in France; founded in 1648. The school of architecture is one of its chief branches. At the beginning of October, 1919, a decree signed by the president reduced the term of office of teachers in the school of Beaux-Arts to five years instead of for life, but the engagement was renewable. The Minister and the Director of Beaux-Arts wished to render the teaching more active. It had been found that in too many cases the appointment to a chair was regarded as an honorable retirement, and the incumbents frequently were unable to attend to their duties. Moreover, the work was said to suffer from the retention of many who on account of old age or for other reasons were unable to render active service. The government argued that it was not reasonable to consider such positions merely posts of honor in reward for a life of hard work, and that education must be conducted in the interest of the student instead of in the interest of the professor.

BEAUX-ARTS INSTITUTE OF DESIGN. A society incorporated in 1916 to carry on the work previously conducted by the society of Beaux-Arts architects, run on a system similar to the Ecole des Beaux Arts of Paris. During 1917-1918 the enrollment was just about half of normal due to the war, and during 1918-1919 it increased but slightly. There are four departments: Architecture under F. A. Goaley, having 314 students enrolled for the year ending Aug. 1, 1919; sculpture under John Gregory, having 295 students; mural painting under Arthur Crisp, having 16 students; and interior decoration under Ernest F. Tyler, having 14 students. What is known as the Paris Prize is offered annually by the Society of Beaux Arts Architects; under its conditions the winner receives \$1200 per annum for two and a half years to study architecture in Paris at the Ecole des Beaux Arts. The competition is open to all male citizens of the United States under 32 years on July 1st. The officers in 1919 were: Thomas Hastings, chairman of the board of trustees; William Laurence Bottomley, secretary, and Lloyd Warren, treasurer and director.

BECKER, GEORGE FERDINAND. Geologist, died April 20. He was born in New York City Jan. 5, 1847, graduated at Harvard 1868 and studied at Heidelberg and Berlin. After serving as instructor in the University of California 1875-9 he became United States Geologist 1879-92 and afterwards held that position from 1894 on. He was a special agent of the 10th Census 1870-83. He made an examination of the gold and diamond mines of South Africa in 1896 and served as geologist with the army in the Philippine Islands 1898-9. In the period immediately preceding his death he was in charge of the Division of Chemistry and Physical Research in the United States Geological Survey. He was connected with the early geological survey in the west, notably that of Clarence King, and wrote report on the Comstock Lode, one of the first mining reports published by the Survey. In the United States Geological Survey he had charge for a long time of the investigations in dynamic geology and was instrumental in the establishment of the Carnegie Geophysical Laboratory. He performed important geological

work during his service in the Philippines. A list of his important writings is as follows: *Atomic Weight Determinations*, (1880); *Geology of the Comstock Lode*, (1882); *Statistics and Technology of the Precious Metals* (with S. F. Emmons, 1885); *Geology of Quicksilver Deposits of the Pacific Slope*, (1888); *Gold Fields of Southern Appalachians*, (1895); *Gold Fields of Alaska*, (1898); *Gold Fields of South Africa*, (1897); *Geology of the Philippine Islands*, (1901); *Experiments on Slaty Cleavage*, (1904); and *Tables of the Hyperbolic Functions* (with C. E. Van Orstrand, 1908).

BELGIUM. A European kingdom lying between France and the Netherlands; restored to independence after the defeat of Germany in the autumn of 1918. Capital, Brussels.

AREA, POPULATION, ETC. The total area is 11,373 square miles and the population, Dec. 31, 1910, 7,423,784; estimated Dec. 31, 1912, 7,571,387. For details of population by provinces, see preceding YEAR BOOK. See also article, AGRICULTURE. The chief towns and population on Dec. 31, 1912, were Brussels, (with suburbs) 663,647; Antwerp, 312,884; Liège, 170,634; Ghent, 167,477. In 1910 those who spoke French only numbered 2,833,334; Flemish only, 3,220,662; French and Flemish, 871,288; German only, 31,415. Those who spoke all three languages were reported at 52,547. The majority of inhabitants professing a religion is Roman Catholic, but no recent figures are available. For educational and other statistics, see preceding YEAR BOOKS. It is required that each commune should have at least one primary school, and the costs of its maintenance rests upon the commune with subsidies from the states and provinces. There are numerous private or free schools which have been mostly under ecclesiastical control. There are four universities, namely, at Ghent, Liège, Brussels, and Louvain, of which the two first are state institutions and the two last free.

MINERAL PRODUCTION. The condition of the mines in Belgium, as in the rest of Europe that had suffered from the war, was lamentable. This was mainly due to the lack of manual labor on account of the war. Nevertheless in September the coal production was reported at 87 per cent of what it had been before the war. The number of miners in Belgium were placed at 98,000. They had not gone on strike but had obtained satisfaction for most of their claims. In the latter part of 1919 there was not only coal enough to run the railways, but Belgium seemed to be producing a larger proportion of the pre-war output than any European country. Belgium was even able to export coal at that time on account of the comparatively small demand of the factories which as yet had been only partially reopened.

ECONOMIC CONDITIONS. The following information in regard to the industrial and financial situation and the prospect of an early economic recovery is supplied by the Trade Commissioner, Oct. 25, 1919: The Belgians have always been

well known for their natural industry and application to the demands of modern production. It was the efficiency of the working classes and the manufacturers, bankers, and traders of Belgium which before the war placed it among the foremost commercial and industrial nations of the world, despite its size and lack of important raw materials. While there were numerous localized labor disagreements throughout Belgium after the armistice, there were no general strikes, and on the whole it may be said that labor here was perhaps more free from ultraradical tendencies than elsewhere in Europe. The deportation of numbers of Belgian workmen and the forced idleness of many others during the war could not fail to have a demoralizing effect, but this is partly balanced by Belgium's comparatively small loss of man power. There were fewer workmen of military age killed or disabled than in the other belligerent countries, because the German occupation of the country proceeded so rapidly that it was impossible to mobilize the full strength of the Belgian army, and many men of military age were unable to join the colors.

During the war there was enforced idleness on the part of a large percentage of the industrial workers, while others were deported to Germany. At the time of the armistice there were 800,000 persons, mostly industrial workers, drawing the nonemployment allowance (*chômage*) granted by the government. In February the number of *chômeurs* was still 720,000, while in September there was but 200,000 dependent upon government assistance. *Chômage* allowances cost the government about 57,000,000 francs in December, 1918, as compared with about 15,000,000 francs per month in the fall of 1919.

The Belgian government actively intervened to settle labor disputes, with very gratifying results. Chiefly as a result of the *chômage* system, it was able to force arbitration in nearly all cases and it had a large staff of labor inspectors empowered to adjudicate disputes before a crisis is reached. While wages increased in most industries at least 100 per cent, and in some cases considerably more, they had not risen to the extent that the cost of living had advanced. The labor-union movement is well advanced in Belgium, but the union leaders are said to be generally disposed to adopt conciliatory methods and to avoid strikes wherever possible. On the whole it may be said that labor troubles after the armistice were far less alarming in Belgium than in most industrial countries. Another important factor in the probable early recovery of Belgium is its comparatively favorable financial situation. The public debt of Belgium in 1914 was slightly less than 5,000,000,000 francs, which largely represented advances for the purchase of the Belgian railways and the improvement of the internal waterways, which have reached such a high stage of development in Belgium. In other words, the public debt was based upon existing properties yielding a profitable return to the government. The taxes in Belgium before the war were light in comparison with most European countries, a condition which was reflected in the general prosperity of Belgian industry. The budget was balanced without difficulty, all current disbursements being met regularly out of current receipts. Interest on the prewar public debt was

almost met by the net profits of the State railways. Belgian industry was prosperous and expanding, and Belgian credit of the best. Before the war the per capita wealth of Belgium was estimated at 7247 francs, a figure exceeded only by Great Britain, France, and Switzerland among the countries of Europe. The annual revenue in 1914 was estimated at 6,000,000,000 francs, a considerable part of which was derived from foreign investments in Russia, the Far East, South America, and other parts of the world. The estimated value of personal property, including foreign investments, was 13,820,000,000 francs in 1913, of which perhaps 2,000,000,000 francs was owned by foreigners.

The prewar debt, totaling 4,887,254,000 francs, had been increased in 1919 to a grand total of 19,780,054,000 francs. This amount includes 2,347,800,000 francs represented by interprovincial bonds covering German fines, and 7,800,000,000 francs for the retirement of the German currency. It includes also 1,255,000,000 francs, representing advances from allied countries after the armistice and up to June, 1919, and 500,000,000 francs for foreign loans not yet contracted. German indemnities stipulated by the Treaty of Versailles were, of course, relied on for the liquidation of a large part of this war debt, 2,500,000,000 francs being payable before May 1, 1921. Before the war the annual interest on the Belgian public debt was about 220,000,000 francs, while the charges contemplated by the present budget total 417,000,000 francs, after deducting the initial payments and reparations to which Germany is obligated. This was believed to be a better showing than can be made by any other major belligerent country. The financial liquidation of the war was nevertheless a matter of great concern, particularly since so much depended upon the ability of Germany to meet its obligations under the Peace Treaty for a number of years to come. The three vital questions with which the Belgian government was immediately concerned were the rapid deflation of the currency, the valorization of the German liabilities, and the reestablishment of a normal budget with receipts as nearly as possible balancing expenditures. Of immediate moment was the reduction of the fiduciary circulation, which increased from 975,000,000 francs in 1914 to over 4,500,000,000 francs in September, 1919. In order to restore the equilibrium of the budget fundamental changes in the fiscal system were under consideration. Before the war direct taxation produced only 100,000,000 francs annually, and indirect taxes were also comparatively unproductive, partly owing to the fact that Belgium is a low tariff country.

In April, 1919, a tax on war profits was adopted, the rate varying from 20 to 80 per cent, calculated on the excess over the average rate of profit during the last two prewar years. It is expected, however, that this new tax will yield not more than 100,000,000 francs during the present year. In July the Ministry of Finance presented to Parliament a law containing drastic modifications in the laws imposing stamp taxes, taxes on patents, etc., but if these new imposts do not yield sufficient revenue the government contemplates the establishment of a revenue tax.

The retirement of the German marks and the complete restoration of franc circulation was

virtually completed in 1919, thanks to the assistance of the Banque Nationale de Belgique, which fortunately remained intact throughout the German occupation.

EXPORTS. It was reported at the end of October that Belgian exports were reviving. The exportation of coal was considerable and beet sugar was also exported, the sugar industry having recovered to such an extent that it was able to produce more even than before the war. Belgium was also exporting large quantities of glass and to some extent matches, yarns, and textiles.

RAILWAYS. The railroads of Belgium were being rapidly restored in 1919. Germany had replaced a large part of the cars and locomotives which were taken away, and slow freight by the autumn of 1919 was moving almost normally. On the main railroads passenger traffic was quite as intensive and as rapid as before the war. This was due to rapid reorganization and reconstruction by engineering and operating staffs. When the armistice was signed 1500 kilometers of Belgian railways had been destroyed by the Germans, but so rapid was the work of repair that by Sept. 1, 1919, only 300 kilometers remained out of order. On the principal railway from Ostend to Brussels extraordinary work was accomplished, and during the summer the normal service was run on the embankment line which was constructed at the time of the Ghent Exhibition, and all work had been more or less restored to its pre-war condition. The bridges across the Lys and Scheldt Rivers were being reconstructed and in the meantime the service was maintained over temporary bridges. Toward the close of the year remarkable railway progress was reported. When the armistice was formed there were only 500 locomotives, and many of these needing repairs, on the Belgian state railways. At the beginning of November, it was reported that there were 2000 passenger trains in operation. In some quarters of the country, as between Brussels and Antwerp, the passenger service was three-fourths of its pre-war efficiency; elsewhere it was from one-half to three-fifths. As to freight, under pre-war conditions there were about 9200 cars on Belgian state railways which moved from 250,000 to 260,000 tons; in October the state railways were moving 178,000 tons. Despite the enormous destruction in war time it was reported at the end of October that practically the whole system was in operation.

FINANCE. In 1919 a bill was proposed to meet the deficit in the budget by taxing inheritance. Although the tax was high it was financial in its purpose and not socialistic. It fell moderately upon the small inheritances in direct line, and heavily upon large fortunes inherited by persons unrelated. The progressive principle was at the basis of it. The succession duties for direct inheritance did not exceed 5 per cent; for indirect, that is for property inherited by persons not related to the testator, it might be as high as 50 per cent. The law provided that the property of persons dying intestate should fall to the state if the relationship passed the fourth degree. Under the former laws relationship up to the twelfth degree was recognized as giving inheritance rights.

ARMY. Shortly before the war, that is early in 1913, a new military law was passed providing for recruiting by means of annual calls to

the colors and voluntary enlistment; service for 15 months in the infantry, fortress artillery, and engineers; 21 months in the field artillery, and 24 months in the cavalry; the total length of service being eight years in the active army, followed by five years in the reserve. During the war compulsory service went into effect on men between the ages of 18 and 40. The reorganization of the army on French territory followed the occupation of the country by the Germans. It had then a strength of about 80,000 men. In the first part of the campaign of 1914 this army was partly destroyed and a new army was formed chiefly from volunteers. At the time of the armistice the field army was placed at 204,000 men including 66 generals and 8400 officers, but not including certain relay troops and battalions of engineers made up of veterans who had been discharged. Forty-four thousand horses imported from America had been distributed among the several units. In 1919 the class under instruction was to replace the demobilized troops. The Minister of War had arranged to relieve from service the old field army for the month of November. A new law was voted by parliament fixing the effectives at 100,000 on a peace footing and 320,000 on a war footing. After the armistice three divisions of Belgian infantry had been sent to reinforce the army of occupation on the right bank of the Rhine, and for these the French military organization was adopted. These three divisions were returning to Belgium during the latter part of the summer. In September figures showing the losses and the present strength of the army were published. The main points were as follows: In 1919 the Belgian army consisted of 365,000 soldiers and 14,050 officers; the fighting units on a war footing had an effective average of 136,000 troops and 4750 officers; in the rear there were on the average 70,000 troops and 2600 officers, and besides that some 22,000 men were on leave pending employment in the munition works and in the public services. During the war recruiting was mainly confined to the territory that had not been invaded, and upon the refugees in Allied countries. Exact returns of the killed and wounded were not available, but it appeared that without counting the missing since the beginning of the war, the number of whom was placed at many thousands, and among whom many must have been killed, the figures of losses placed the men at 20,148 and the officers at 982 or at the rate of one officer for 20 or 21 men. This figure is probably too low. It places the ratio to the number of the mobilized at 6.98 per cent for the officers, and 5.51 per cent for the troops, but this refers to the entire force mobilized and not to those really engaged in battle. The number of soldiers who died in the hospital was placed at 9422 of whom 4914 died of wounds, and 4058 of disease. The number admitted to the hospital was 200,409, of whom 122,987 were admitted for sickness and 77,422 for wounds. The wounded were classified as follows: The severely wounded, 19,785; slightly wounded, 57,637; recovered, 160,052. The men suffering amputation number 1387, and the blind, 47. These figures do not include the number of the wounded and sick who were in the invaded territory before the battle of the Yser. The ratio to the number of combatants was: Severely wounded, 14.05 per cent; slightly wounded, 40.94 per cent.

GOVERNMENT. The executive power is vested in a king and a responsible ministry and the legislative power in the king, senate and Chamber of Representatives. The Senate consists of 120 members of whom 27 are elected by the provincial councils and the remainder elected directly. The Chamber according to the law of May 2, 1912, had 186 members. Previous to the election of 1919 they were chosen by plural suffrage. According to the rule prevailing before the war every citizen over 25 years of age who had lived for a year in the same commune had one vote; and every citizen over 25 with legitimate issue and paying five francs or more a year in house tax had a supplementary vote. Two supplementary votes were also given to students of 25 and over who had received a certain diploma or certificate of instruction and there were other qualifications bringing supplementary votes, but no person was to have more than three votes. In 1912-13 the number of electors for the Chamber was 1,745,666. Of these 1,005,094 had one vote; 412,721, two votes, and 327,851, three votes. The election of 1919 (see below) proceeded for the first time on the principle of one man one vote. King Albert was born Apr. 7, 1875 and succeeded to the throne Dec. 17, 1909. He married Oct. 2, 1900, Princess Elizabeth of Bavaria. Children: Prince Leopold, Duke of Brabant (born Nov. 3, 1901); Prince Charles, Count of Flanders (born Oct. 10, 1903); and Princess Marie José (born Aug. 4, 1906). The ministry at the beginning of 1919 was as follows: Prime Minister and Minister of Finance, M. Delacroix; Minister of Economic Affairs, M. Jaspar; Minister of Foreign Affairs, M. Paul Hymans; Minister of Education, M. Harmignies; Minister of Interior, Baron de Broqueville; Minister of Agriculture, Baron Ruzette; Minister of War, M. Masson; Minister of Justice, M. E. Vandervelde; Minister of the Colonies, M. Franck; Minister of Industry and Labor, M. Wauters; Minister of Railways, Marine, Posts and Telegraphs, M. J. Renkin; Minister of Public Works, M. Anseele.

GENERAL CONDITIONS. After the armistice the country was administered by the national coalition cabinet mentioned. It was composed of three parties, the Catholics, Liberals, and Socialists and represented a balance between the Walloons and Flemings. The Socialist members had done good service in the interest of industrial peace, by discouraging strikes, and other members also had shown ability as administrators, in the economic domain, such as M. Renkin, Minister of Railways, and M. Jaspar, Minister of Economic Affairs. The programme of the government comprised universal suffrage, facilitation of amendments to the constitution, the reform of the penal code, and the creation of a Flemish university. The King on reëntering Brussels had promised suffrage without restrictions, and it was decided to hold the next elections on the principle of one man, one vote. On May 17th the government declared that the estimated damage which Belgium had sustained at the hands of Germany was \$7,600,000,000, of which \$1,705,700,000 represented the losses to industry both from actual damage and from inactivity. On June 25th a bill was presented in the Chamber by the government placing in the hands of a self-governing body to be known as the National Belgian Railways Administration the management of the railways;

this body to be responsible to parliament and to be a branch of the civil service. According to the Minister of War the slow recuperation of Belgium was due to the extreme severity of the war régime. As to the question of the river Escaut (see WAR OF THE NATIONS), he said that complete possession of it was the only way of giving Belgium an effective means of defense and replacing the guarantee of permanent neutrality. The Belgian budget had been 350,000,000 francs a year before the war. In 1920 it would be quadrupled. The war budget would be far more than any that preceded. The pension list alone including besides military pensions, allowances to the sick, widows, discharged soldiers, and officers for length of service would exceed 100,000,000 francs, and heavy burdens were necessary to cover the expenses. It was argued that in these extreme circumstances political quarrels had no place and that the question of woman's vote ought not to come up before the dissolution of parliament. The cost of living was increasing each day and the only way of meeting it was increased production. In the summer a law concerning freedom of labor was under discussion. This looked to the suppression of the article of the penal code concerning attempts to restrict the liberty of labor. This article sought to repress such attempts. The Socialists including their leader, M. Vandervelde, a member of the Cabinet, had for many years protested against this article and had already brought in a measure to repeal it. Other members of the cabinet were unwilling to go so far. The question was difficult for it involved the principle of individual liberty. The article guaranteed the liberty of labor and the suppression of it seemed a very radical measure in a country which is especially industrial. The Liberal party of the Left was especially opposed to it. Finally the ministry agreed on a text which substituted for the suppression of the text upon liberty of labor a formula which guaranteed more completely the freedom of association. The penalties imposed by the original article were to be greatly reduced. It was supposed that the bill if passed would greatly strengthen the power of the unions and assure them a firmer hold on labor organization. There was strong opposition to it in parliament.

POLITICAL CONDITIONS. In the summer public opinion was concerned with the approaching legislative elections which were expected to take place in November. There were signs that the union hitherto maintained between the Catholics, Liberals, and Socialists was weakening. The economic crisis had lately directed the policy of the Socialist party. All political groups were working on a practical electoral programme. One of the programmes put forth by the Socialist party included: Nationalization of mines; reform of mine inspection; the participation of the working men in the control; pension of two francs a day to workmen in all trades. The same programme was adopted by the federation of miners which demanded that the state should resume the exploitation of the new mineral deposits of Campine and Hainault while waiting for nationalization of all the coal basins. The language question continued to cause dissension. The Minister of War declared that at present recommendations had been made all tending to the creation of two separate ad-

ministrations and two armies. This was for the purpose of guaranteeing the self-government of the Flemish and Walloon elements. But the unity of the country was the first consideration and the new legislature must address itself to this question from that point of view and must solve in particular the problem of the university. The latter problem was under discussion in Belgium during the months following the armistice and it was understood that the government was at work upon plans. Public opinion seemed to be entirely against the Flemish programme that the Germans had carried out, involving the transformation of the French university of Ghent into a Flemish university. It was hard to determine by what means the aspirations of the Flemings for higher instruction in their mother tongue could be realized without injustice to the University of Ghent and to French culture in Flanders. There was question whether there should be a doubling of the course. Could they without inconvenience double the course of the independent Flemish university at Ghent or at Mecklin or Bruges or Antwerp? At Ghent professional opinion seemed to be entirely against any change that would affect the character, autonomy, and influence of the French university. The teaching bodies and members of the Ghent bar had pronounced against it. In August a ministry decided to appoint a committee to consider the means of forming an independent Flemish university.

THE ELECTIONS. The precise result of the elections was known early in December. The new Chamber according to press reports was constituted as follows: Catholics, 77; Socialists, 67; Liberals, 33; Flemish "Activists," 3; Middle-class Representatives, 2; Representatives of Combatants, 3; Nationalist Party, 1. The Socialists gained 27 seats while the Catholics lost 24 and the Liberals lost 12. The new electoral system consisted in applying the principle of minority representation to the district and not to the province. It was criticized for its working by all the parties. The Socialists' victory was explained as due mainly to the introduction of universal suffrage pure and simple and to reduction of the voting age from 25 to 21 years. It was also explained in part by the fact that the Socialist party in Belgium was unanimous in condemning Bolshevism. Not only was it free from any heresy on this score but it stood well with the people on account of its patriotism during the war and its refusal after the armistice to resume relations with the German Social Democracy. The Socialists of Belgium moreover have a comparatively moderate programme (see *SOCIALISM, Belgium*). The senatorial elections had the following results: Catholics 43; Liberals 30; Socialists 20. This however does not include 27 senators, to be elected later by the provincial councils. A striking feature of the returns was the loss by the Catholic party of the majority which it had kept for the past 35 years. This loss was not unforeseen for the elections for a long time past had indicated that the party had been over-represented in parliament. Socialist gains had been expected but it had not been anticipated that the labor element would show such strength. In the new parliament it was represented by 66 deputies. Another result of the ballot of November 16 was that it placed in the Chamber a very

large number of the Flemish group (*Flamingants*). The success of the Flemish *Flamingants* resulted in an offer of a portfolio to one of the leaders of the active wing of that party. By a law voted at the last session of parliament the lists presented by any one party in different districts of the provinces could be associated. If this modification had not been made the strongest political groups would have profited and the Catholics would have kept 83 seats in the Chamber while 10 supplementary seats would have been given to the Catholics of the Flemish region. The Socialists also would have had 72 seats instead of 66. The members of the "Front party" or Christian Democrats each obtained an additional seat as a result of the new system, and the partisans of a national policy though they received few votes also gained a seat as a result of the change. The main party to profit from it, however, was the Liberal group. But for this change they would have been still further reduced. An incident that attracted attention on the eve of the elections was the proceeding against the *Socialiste belge*, organ of the revolutionary party, which during the war was published in the Netherlands under the editorship of M. Camille Huysmans, secretary of the bureau of the International. It was accused of showing pro-German tendencies, and being plainly defeatist. The director, M. Huysmans, had been a deputy from Brussels, but in the elections he stood for Antwerp on the same list with a militant contributor to his paper whose course had been suspected during the war. Against him was a representative of the Labor party. The Labor party appointed M. Emile Vandervelde to go to Antwerp and defend Huysmans's list and Huysmans's candidacy at a large public meeting. This course on the part of M. Vandervelde was attacked as inconsistent with his position as minister of justice. Another feature of the campaign was an address by M. Paul Hymans, minister of foreign affairs, in which he appealed for harmony in the interest of reconstruction, and declared that no party could by itself assume responsibility for the heavy burdens that were inevitable. Some 500,000,000 of new taxes must be imposed; the senate must be reorganized and the referendum must be introduced. As to the foreign situation he declared that the position of Belgium had changed and that the country was now a free sovereign state. Belgium must therefore have in the future a definite international policy. As to the language question the Liberal leader pointed out that this question did not exist in the Walloon provinces and that in the Flemish provinces it must be solved in accordance with the entire liberty of the father of the family. The Liberals according to him were firmly opposed to the suppression of the University of Ghent which was a centre of French culture and civilization. The Walloon League also pressed the language issue on the public attention during its session at Namur, after the elections when it condemned those who had cooperated with the Germans during the occupation with a view to dividing the country. It declared in favor of provincial decentralization, which, however, was not a popular policy in Belgium. See LABOR LEGISLATION; SOCIAL INSURANCE.

BELL, JAMES D. American soldier and politician, died at Flatbush, New York, November 1.

On the previous September he had been elected Commander-in-Chief of the Grand Army of the Republic. He was born in New York City in 1845; entered the Civil War at the age of 16; and served for the most part in Virginia, where he was twice wounded. In 1880 he was admitted to the bar and practiced law for the next 25 years. He was a Democrat in politics and was made Police Commissioner of Brooklyn in 1888, after which he was for 10 years commissioner and secretary of the Williamsburg Bridge Commission. After 1911 he was chairman of the general Democratic committee of King's County. He was for many years one of the leading figures of the Grand Army of the Republic.

BELL, JAMES FRANKLIN. American major-general, died in New York City, January 9. He was born at Shelbyville, Ky., Jan. 9, 1856; graduated at West Point in 1878 and served with the 7th Cavalry in the West. He was afterwards in the Spanish-American campaign in the Philippines and against the natives; was awarded the Congress medal of honor in 1899; was chief of staff of the United States army from 1906 to 1910; commander of the Philippine Division 1911 to 1914; of the Second Division United States army in Texas from 1914 to 1915; of the Western Department from 1915 to 1917, and of the Eastern Department for a few months in 1917 when he was appointed commander of the 77th Division of the National army at Camp Upton.

BELL, JAMES MONTGOMERY. American soldier, died at Los Angeles, Cal., September 17. He was born at Williamsburg, Pa., Oct. 1, 1837; graduated at Wittenberg College in 1862, and entered the Union army in the Ohio infantry during the Civil War throughout which he served with distinction, being brevetted for his gallant services in the Battle of the Wilderness, etc. He served on the Indian frontier, from 1866 to 1898 and in the following year was sent to the Philippine Islands where he served as military governor of the Southern Luzon district. He retired in 1901.

BENEFACCTIONS. See GIFTS AND REQUESTS.

BENESH, EDWARD. Representative of Czecho-Slovakia at the Paris Peace Conference. He was foreign minister of the Czecho-Slovak republic. He had been a student of sociology and had taught at the Czech university of Prague. In his youth he had been a pupil of Professor Masaryk, now President of the Republic. Early in the war he made his escape from Bohemia and joined Masaryk in the foundation of the Czecho-Slovak Council. He also aided in raising the Czecho-Slovak army and in securing recognition of the Czecho-Slovak state by the Allies.

BEREA COLLEGE. A non-sectarian co-educational institution, located at Berea, Ky. In the summer session of 1919 there were 205 students, and in the fall, 1794. There was also a training school of 105. The teaching force numbered 81. The library contained more than 35,000 volumes. Productive endowment, \$1,345,588; income therefrom, \$55,649; rental properties, \$74,656; net income last year, \$2843; total income, \$58,492. President, William Goodell Frost, Ph.D., LL.D.

BERESFORD, ADMIRAL CHARLES WILLIAM DE LA POER. (LORD BERESFORD.) British naval of-

ficer, died at Langwell, Scotland, September 6. For many years before his death he was a leading naval administrator and authority on naval matters. He was born in Ireland Feb. 10, 1846, and became a naval cadet in 1859. He rose to the rank of lieutenant in 1868, commander in 1875, captain in 1882, and rear-admiral in 1897. During this period he commanded the *Condor* in the bombardment of Alexandria in 1882 and after the occupation of the city served as chief of police—was honored with medals for gallantry and meritorious services; served with the Nile Column of the Gordon Relief Expedition in 1884; commanded (1885) the naval brigade at the battle of Abu Klea and other engagements; led the expedition which rescued Sir Charles Wilson's party, and for this and other distinguished services in the Sudan received a vote of thanks from both Houses of Parliament; he was made Lord Commissioner of the Admiralty in 1886 but resigned on account of a difference of opinion over the strength of the fleet; was member of Parliament 1874-80, and 1885-90. In 1898 in the course of a journey around the world he visited the United States where he made speeches on behalf of the "open door" policy in China. After holding other important commands he was commander-in-chief of the Mediterranean fleet 1905-07 and the Channel fleet from 1907 to 1909. He retired in 1911 and was member of Parliament from Portsmouth on the Unionist ticket 1910-16. He wrote extensively on naval subjects and on Egypt besides the following books: *Nelson and His Times* (1898-1905); *The Breakup of China* (1899); *The Betrayal* (1912), and *Memories* (1914).

BERKSHIRE FESTIVAL. See Music, *Chamber-Music*.

BERMUDA. A group of small islands in the West Atlantic about 580 miles from Cape Hatteras, N. C., and 677 miles from New York, belonging to the West Indies, but detached from the other groups. They are celebrated for their climate and scenery and for many years have been a favorite resort for Americans. Some 20 of them are inhabited. Total area, 19.3 square miles; population (Jan. 1, 1918) 21,629, of whom 7369 were whites. American visitors have averaged about 20,000 annually. Commerce and finance statistics follow:

	1914	1915	1916	1917
Imports	£565,611	£579,828	£734,799	£674,493
Exports	106,661	107,666	139,825	207,714
Revenue	80,504	106,467	107,055	100,447
Expenditure . . .	89,575	97,643	109,652	105,867
Shipping *		1,748,337	1,630,163	547,835

* Tonnage entered and cleared.

The chief imports in 1917 were provisions, flour and meal, cotton goods, butter, ale and beer, hardware and cutlery, groceries, oats, coal, sugar, apparel, leather wares, cattle, etc. The chief exports were onions, potatoes, and other vegetables. It is governed by a governor, assisted by an executive council of six members and a legislative council of nine members, both appointed by the crown, and a representative house of assembly of 36 members. Governor at the beginning of 1919, Sir James Willcocks.

BERTIE, FRANCIS LEVESON, first Baron of Thame, British diplomat, died in London September 26. He was born Aug. 17, 1844, the

second son of the Earl of Abingdon, and entered the Foreign Office in 1863. He was in the special embassy to Berlin in 1868 and in 1894 was appointed Under-Secretary of State for Foreign Affairs. From 1896 to 1903 he was chairman of the Uganda railway committee and then was appointed ambassador to Rome, where he remained until 1905 when he went to Paris.

BESSARABIA. A former government of the Russian empire, reaching from Galicia south toward the Black Sea, with Podolia and Kherson on the north and east, Moldavia on the south-west and west, and Dobrudja on the south. Area, 17,143 square miles; population, estimated (Jan. 1, 1915), 2,686,600. The racial elements are Moldavians and other Rumanians, Little Russians, Poles, Bulgars, Jews, Armenians, Greeks and Tatars, of whom over two million are said to be dependent on agriculture. As noted in the Year Book for 1918 there was a movement after the defeat of the Central Powers in November for union with Rumania. The Rumanians were active in the country from that time on and their course was criticized extensively in liberal quarters as part of a policy of imperialism or expansion at variance with the principles by which the Peace Conference was supposed to be guided. On the other hand the Rumanian side of the question was set forth by the Bessarabian delegate to the Peace Conference in a statement in which some of the chief points are as follows: Although the Rumanian authorities were suspected in certain circles of hostility to the democratic tendencies of the country they showed respect for the popular rights gained in Bessarabia from the revolution and they favored agrarian reform, democratic decentralization, and the political equality of all the nationalities. The result was to draw toward Rumania the liberal element in the population and the Rumanian universities were crowded with Bessarabian students. During the elections for the Rumanian Constituent Assembly the Rumanian authorities followed their rule of interfering as little as possible with the internal affairs of Bessarabia. The results of the election were not known at the close of the year 1919 but so far as the figures were available they indicated that the successful candidates all favored union with Rumania. The attitude of Rumania as characterized by this Rumanian delegate from Bessarabia is one of self-denial and sacrifice. He declared that the kingdom of Rumania subsidized the whole administration, the revenue from the country amounting only to 30 per cent of the expenditure. The Peace Conference had not settled the status of Bessarabia at the close of the year and the question was still pending as it was in regard to the other countries that had sought emancipation from Russia.

BETHLEHEM BACH FESTIVAL. See Music, *Festivals*.

BIBLE SOCIETY, AMERICAN. A society founded in 1816 for the wider circulation of the Bible to all people, without denominational or racial discrimination. It supplies these Bibles at practically cost prices. It has printed the Scriptures in 67 languages at the Bible House, New York, and circulated them in more than 150 languages. In 1918 (the latest available statistics) the society issued Bibles in the United

States in 75 languages; abroad in 66 languages. Over 160 languages and dialects have received a written form first through translators of the Bible. The Society has shared extensively in this work. The Scriptures, in whole or in part have been printed in 650 languages. During 1918 the Society issued at home, 4,480,058 volumes; abroad, 1,560,649; a total of 6,040,707 as against a total in 1917 of 4,818,564 volumes. It issued 1131 volumes for the blind. During its 103 years it has issued in the United States 80,962,687 Scriptures; in foreign lands, 53,188,943; a total of 134,151,630 volumes. As has always been its custom, it has supplied Bibles to the armies of whatever countries were at war. During 1918 it supplied 3,292,734 volumes to the American forces, and about 30,000 to European forces. Combining the issues at home (4,541,455) and abroad (1,846,488) from August, 1914 to December, 1918, the Society has furnished 6,387,943 volumes in war service. The work is carried on through 11 foreign agencies with 993 workers and nine agencies in America with 621 workers, besides many societies, hospitals, and religious organizations. The Society has permanent trust funds totaling \$2,140,563.77. During 1918 it received \$101,694 in legacies. The Northwestern Agency headed by Rev. S. H. Kirkbride showed a decided increase over 1917, 276,973 volumes being put in circulation in 47 different languages and dialects. The Colored Agency, also showing an increase over 1917, found 3085 families with no Bibles at all in its territory. The report of Rev. Frank P. Parkin of the Atlantic Agency shows a growing interest on the part of college students in the distribution of the Scriptures. During the year the tentative version prepared by the Committee in Madrid has been the subject of review and comment by many in the Spanish-speaking field. These comments are being gathered together for final action preparatory to the bringing out of the edition for general use. The demand for an edition of the Portuguese Version with references is increasing and most insistent. The revision of the Psalms in Siamese was completed, while work on the translation of the Four Gospels into Mukri Kurdish in Levant, and the translation of St. Mark for the Kaw and Lahu mountain tribes in Siam, has been progressing. The *Bible Society Record* is the official organ of the Society. The officers in 1919 were: President, Churchill H. Cutting of New York; general secretaries, Rev. William I. Haven, and Frank H. Mann, and treasurer, William Foulke. The national headquarters of the Society are at Bible House, Astor Place, New York City.

BIKANER, MARAJAH OF. See SINGH, SIR GANGA.

BILLIARDS and POOL. Billiards attained its highest popularity in 1919, both professional and amateur players entering the various tournaments in large numbers. William F. Hoppe once more reigned supreme in professional circles as a handler of the cue and Robert L. Cannefax retained his crown in three-cushion play. An upset occurred in pocket billiards, or pool, when Frank Taberski, the title holder, was forced to yield his laurels to Ralph Greenleaf.

Among the amateurs David McAndless came to the fore by winning the 16th annual Class A

balkline 18.2 championship tournament contested at the Chicago Athletic Association. The Class B honors went to George T. Moon, Jr., and Joseph Neustadt captured the Class C title. A national three-cushion carom championship for amateurs was held for the first time, the winner being Arthur Newman. J. Howard Shoemaker again triumphed in the pocket billiards competition.

BIRTH CONTROL. During the past few years there has been a very active movement in the United States for the repeal of laws prohibiting the dissemination of knowledge concerning the use of contraceptives. Most prominent in this movement were Mrs. Margaret Sanger and Mrs. Ethel Byrne. Mrs. Sanger is Editor of *The Birth Control Review*, a monthly established in 1917 by the leaders of the movement, at 104 Fifth Avenue, New York City. She has been arrested several times during the past year and has thus become prominent before the public. Prior to the movement in the United States, organizations to promote birth control had been established in almost every European country. The national bodies of England (formed in 1877), Holland (1885), Germany (1889), France (1895), Bohemia-Austria (1901), Spain (1904), Brazil (1905), Belgium (1906), Cuba (1907), Switzerland (1908), Portugal, Sweden (1911), Italy (1913), Mexico (1918), and of Algeria constitute the Federation of Neo-Malthusian Leagues with Dr. Alice Drysdale Vickery, London, president. In the United States supporting groups have been formed at Ann Arbor, Mich.; Bangor, Me.; Boston; Chicago; Cleveland; Detroit; Elizabeth City, N. J.; Harrisburg; Los Angeles; Minneapolis; New York; Pittsburg; Portland, Ore.; Radnor, Pa.; Rochester; St. Louis; St. Paul; San Francisco; Seattle; Summit, N. J., and Washington, D. C. The organizations at New York include the Committee of One Thousand, with Dr. Ira S. Wile, as chairman; the Woman's Committee of One Hundred, with Mrs. Amos Pinchot, chairman; the National Birth Control League at 200 Fifth Avenue, with Mrs. Maxwell Hyde as chairman; and The Voluntary Parenthood League, with Mary Ware Dennett as director. The Voluntary Parenthood League held its first public meeting on April 10th, and is the fourth organization in New York City whose purpose is to secure intelligent birth control.

In New York, where it is unlawful to impart information regarding the use of contraceptives, the movement to repeal the law has been vigorously opposed. In general, the movement has been aided by prominent individuals and liberal journals. On Dec. 31, 1918, Margaret Sanger and Kitty Marion were arrested in New York City. The former was arrested on the ground that her article "Birth Control or Abortion," which appeared in the *Birth Control Review*, was obscene. Kitty Marion was arrested for having sold the article. The subject matter of the article was similar to that found in the pamphlets on sex issued by the War Department, the Y. W. C. A., and other social hygiene associations and the obscenity charges were dismissed on Jan. 18, 1919. George Swasey and

Kitty Marion were arrested on August 9th. No charge was pressed against the latter, but Swasey was convicted. He was sentenced to serve 10 days in jail or pay \$50 because he had discussed birth control in the presence of children. This case has been appealed. The question, whether birth control is women's inherent right, is still unanswered. Margaret Sanger had been previously arrested on Oct. 26, 1916, for operating a birth control clinic in Brooklyn. She was sentenced to 30 days in jail and served her sentence. The case was appealed on principle and finally reached the Federal Supreme Court, Oct. 12, 1919. The case was dismissed without an opinion because the court held that it had no jurisdiction.

The medical profession is not unanimous in its attitude toward the movement. In an editorial of its March issue, *American Medicine* came out strongly for birth control. It observed that the popular misconception of the birth control movement is that it stands for birth prevention and the small family. This impression is entirely erroneous. It pointed out that the opponents of birth control had produced no definite programme of legislation which would eradicate the evils of the present system. Finally it declared that dangerous, unintelligent birth control does actually exist and that it prefers intelligent birth control to ignorant, unenlightened birth control. In expressing this preference, it believes that it is voicing the opinion of a majority of the medical profession. The results of a questionnaire on birth control, sent to a number of physicians by Dr. William J. Robinson and Mary Ware Dennett, were published in the *Medical Review of Reviews* for March. The answers revealed the significant fact that 25 per cent of those who answered the questionnaire did not believe themselves sufficiently qualified to express an opinion on the subject. During November hearings were held on birth control before the American Social Hygiene Association, the Social Morality Association of the Y. W. C. A. (through the International Conference of Woman Physicians), and the Social Hygiene Committee of the League of Women Voters.

STATUTES. According to present laws, birth control clinics are legally possible in thirty-two (32) of sixty-five (65) larger cities in the United States. In thirty-three (33) they are not legally possible. In eighteen (18) states there is no law prohibiting the giving of contraceptive information verbally. A Federal law makes such information unavailable. Birth control literature does not come under the Federal law penalizing the mailing of obscene literature. During the year the Pennsylvania Legislature passed a bill (House Bill 376) prohibiting the dissemination of information which tended to restrict birth control. This bill, however, was vetoed by the governor. A judge in the New York State Court of Appeals recently gave an opinion to the effect that a doctor may give a patient contraceptive information *in order to prevent disease*. For Criminal Statutes on Birth Control, see *The Birth Control Review*, October, 1918.

ENGLAND. The Bishop of Birmingham, England, who is president of the National Council of Public Morals and chairman of the English National Birth Rate Commission, has come out with a statement in favor of birth control. He

declares that "morally as well as eugenically it is right for people in certain circumstances to use harmless means to control the birth rate."

BIRTH RATE. See VITAL STATISTICS.

BISSELL, HERBERT PORTER. Jurist, died at Lockport, N. Y., April 30. He was born at New London, N. Y., Aug. 30, 1856; educated in Germany and at Harvard University, where he graduated in 1880; admitted to the New York bar in 1883 and practiced in Buffalo. He was Justice of the Supreme Court of the State after 1912. He was a member of many important State organizations and was at one time Judge Advocate in the New York National Guard.

BISSELL, WILLIAM GROSVENOR. Sanitary expert and bacteriologist, died at Buffalo, N. Y., November 14. He had been for many years well known as a sanitary expert in New York State. He was born at Lockport, N. Y., Jan. 30, 1870, and graduated at the medical department of the University of Buffalo in 1892. He practiced in that city and became a chief of bureau and bacteriologist in the Department of Health, in 1894. He successively held important positions in the State administration of health, and he served as surgeon in the National Guard for 20 years, retiring in 1913.

BLAKE, CLARENCE JOHN. Otologist, died at Boston, Mass., January 29. He was born at Boston, Feb. 23, 1843; studied at the Lawrence Scientific School and the Harvard Medical School where he was professor of otology from 1888 to 1913. He was on the staff of several hospitals and member of leading medical bodies and the author of *Operative Otology*.

BLAKELOCK, RALPH ALBERT. Painter, died in the Adirondacks, New York, August 9. He was born in New York City Oct. 15, 1847, and graduated at the College of the City of New York, 1867. Devoting himself to painting for the most part without teachers, he soon distinguished himself for work of rare character especially in his studies of Indians in the west. Among his chief pictures are the following: "Indian Girl," "Uinta Tribe," "Shooting the Arrow" (1880); "Bannock Wigwam in Peaceful Vale" (1893); "Autumn," (Mrs. Kurtz, New York); a beautiful moonlight scene, in the Lambert collection, Paterson, N. J.; "Sunset," "Nevarra Range," (W. T. Evans, New York); "The Pipe Dance," (Metropolitan Museum of New York) one of his finest productions. More than 20 years before his death he was pronounced insane and he was kept under restraint until within a few years of his death when he seemed to have completely recovered and returned to renew his friendships and associations.

BLANCHARD, RAPHAEL. French scientist, an authority in bacteriology, died in Paris toward the latter part of March. He was born in 1857. He was a well known zoölogist, and several times represented France in international congresses. He was born at Saint-Christophe, France, Feb. 28, 1857, a descendant of the celebrated French aeronaut Blanchard; became professor in the faculty of medicine at Paris in 1883, and in 1897 succeeded to the chair of natural history which at his request was changed to the chair of parasitology, in which subject he had made himself an authority. He founded the Institute of colonial medicine at Paris, and organized the French congress of zoölogy, and the French association for destroying insect

pests. He was also for 20 years general secretary of the zoological society of France.

BLISS, EDWIN MUXSELL. Author and editor, died at Washington, D. C., August 7. He was born at Erzeroum, Turkey; educated at Robert College, Constantinople, 1862, and afterwards at Amherst and Yale. He was editor of the *Encyclopædia of Missions* (1889-91) and of its second edition in 1910 and he was on the staff of the *Independent* for 10 years following 1891 as well as staff contributor for other periodicals. He published *The Turk in Armenia, Crete and Greece* (1896) and *Missionary Enterprises* (1908). In 1913 he compiled a summary of State laws relating to dependent classes and was engaged in other work in the Bureau of the Census.

BLISS, GEN. TASKER H. American representative at the Paris Peace Conference. He was assistant chief, then chief of the American general staff at Washington. After the Spanish War he was prominent in the reconstruction of Cuba under the military government. He also served as military adviser on Mexican affairs. Before the Conference he was a prominent figure in the Supreme War Council.

BLOSSOM, H. MARTYN, JR. Playwright, died in New York City, March 23. He was born at St. Louis, Mo., May 10, 1866, and engaged in the insurance business, but later removed to New York City and wrote stories and plays. The latter include *Yankee Council*; *The Red Mill*; *the Only Girl*; *The Man from Crooks* and other plays, among which the best known was perhaps *Mlle. Modiste* in which Fritz Schell played the principal rôle.

BODANZKY, ARTUR. See MUSIC, *Orchestras*.

BOHEMIA. Formerly a crownland and titular kingdom of Austria, but after the downfall of the dual monarchy in the closing months of 1918 a member of the new Czecho-Slovak state (see CZECHO-SLOVAKIA); in the northwestern part of the former empire, bounded on the north by Saxony and Silesia, on the east by Moravia and on the south by Moravia and Lower and Upper Austria. Area, 20,557 square miles; population, 1910, 6,769,548; 1913, estimated, 6,860,029. The ethnical elements according to the census of 1910 were as follows: German-speaking, 2,467,724 (36.76 per cent); Bohemian, Moravian, Slovak, 4,241,918 (63.19 per cent); Polish, 1541; Ruthenian, 1062. Catholics numbered 6,447,536 (95.60 per cent); Evangelicals, 176,941 (2.61 per cent); Jews, 85,826 (1.27 per cent). Prague, the capital and largest city, had an estimated population June 30, 1914, of 541,500 including suburbs. Down to the changes at the close of 1918 the country was governed locally by a single chamber of 242 members and was represented in the lower house of the Reichsrath by 130 members. See AUSTRIA-HUNGARY.

BOILERS. MARINE BOILERS. The United States Steamboat Inspection Service, in its annual report, recommended the creation of a corps of experts in the Office of the Supervising Inspector General for the approval of the construction of both hulls and boilers. It was believed that if the plans of new vessels were examined and approved at such an office and blue prints and specifications sent to local inspectors at places where the boilers were to be built and where the vessels in which the boilers were to

be installed would be inspected, that the local officials would not be required to pass on the design of the boilers, but merely to see that they were built in accordance with the blue prints and specifications already approved in the Central Office. During the year the bureau, in view of the fact that the rules of the Board of Supervising Inspectors were criticized for not being up-to-date with reference to boiler pressures; that proper credit was not given to the riveting plan above double riveting, such as triple and quadruple riveted joints, and that objection was made to the practice of the Service with reference to hydrostatic pressure, drafted a bill looking to the amendment of sections 4433 and 4418, U. S. Revised Statutes, which had been introduced into the Senate as Senate Bill 574. Section 4433 Revised Statutes as it exists, reads as follows:

"The working steam-pressure allowable on boilers constructed of plates inspected as required by this Title, when single-riveted, shall not produce a strain to exceed one-sixth of the tensile strength of the iron or steel plates of which such boilers are constructed; but where the longitudinal laps of the cylindrical parts of such boilers are double-riveted, and the rivet-holes for such boilers have been fairly drilled instead of punched, an addition of 20 per centum to the working-pressure provided for single riveting may be allowed. Provided, That all other parts of such boilers shall correspond in strength to the additional allowances so made: and no split-calking shall in any case be permitted."

The recommendation of the Bureau was that this section be amended to read as follows:

"The working steam pressure allowable on all boilers inspected as required by Title LII shall be determined by the rules of the Board of Supervising Inspectors with the approval of the Secretary of Commerce."

The Bureau stated that the purposes of the proposed amendment in this section were, first, to do away with the obsolete rule contained in the present law, which prescribes a working steam pressure for single-riveted joints, without taking into consideration the percentage of strength of the riveted joint, and allows 20 per cent additional pressure for double-riveted joints, but which does not allow a greater working pressure for triple-riveted and quadruple-riveted, etc., lap and butt joints, for which greater working pressure should be allowed on account of the greater strength of the triple-riveted and other joints of greater strength than the double-riveted joints. This greater allowable working pressure for the stronger forms of riveted joints has for years been desired by boiler users.

The Bureau also recommended an amendment in the law that the rule for the hydrostatic pressure applied to boilers should be determined by the Board of Supervising Inspectors, with the approval of the Secretary of Commerce.

BOISDEFFRE, RAOUL FRANÇOIS CHARLES LE MOUTON DE. French soldier and diplomat, died August 24. He was born at Alençon in France in 1839 and studied at the military school at Saint-Cyr, and the Staff College, and during the Franco-German war was a major of cavalry, and aid to General Chanzy. About 1890 he had become chief of staff and his name appeared prominently in the newspapers during the Dreyfus affair in 1898. At the trial of Zola he declared that there was a third secret document

showing the guilt of Dreyfus. After the confession of Lieutenant-Colonel Henry to the effect that this document was a forgery, General Boisdeffre resigned. His reputation rests mainly, however, on his activity as an agent for the alliance between France and Russia. He was much liked and respected at the Russian court, and had been received with special honors, when in 1879 he was serving as military attaché at Saint Petersburg. He was therefore chosen for the mission sent to Russia for the purpose of making certain military engagements, and the understandings then entered into formed the basis of the Franco-Russian entente. This was in 1892 and these military conventions were for a long time the only documents on which the alliance rested. They related exclusively to a defensive alliance. Many stories were told at the time of his death about his Russian experience and his conversations with the czar and the German Emperor, taken mainly from the volume of reminiscences by M. Arthur Meyer, the editor of the *Gauleois*.

BOKHARA. A state of central Asia, formerly under the government of the Russian empire, lying between the Russian provinces of Syr-daria and Samarkand on the north and Afghanistan on the south. Area estimated at 83,000 square miles, and population at 1,250,000. The chief town is Bokhara with about 75,000 inhabitants. Other cities with estimated populations are: Karshi, 25,000; Khuzar, Hissar, and Shahr-i-zabz, 10,000 each. The Trans-Caspian railway crosses the country from the Oxus to a point within a short distance of the capital and thence to Tashkent. The chief products are fruit, silk, grain, tobacco, cotton, hemp, live-stock, and mules. The chief minerals found are gold, salt, alum, etc. There is a considerable trade with India in exports of raw silk and imports of green tea, indigo, drugs and wearing apparel. The Ameer in 1919 was Sayid-Mir-Alim Khan, who succeeded Jan. 6, 1911.

BOLIVIA. A South American republic situated in the interior of the continent to the west of Brazil and east of Chile. Historically considered Sucre is the capital and is the seat of the supreme court, but La Paz, the largest city, is the actual seat of government, containing the executive and legislative departments and being the place of residence of the foreign representatives.

AREA AND POPULATION. Area estimated at 532,437 square miles, and, including disputed territory, at 562,047. Another estimate places it at 514,155 exclusive of the territory claimed from Paraguay. Population, estimated in 1915, 2,889,970, but a lower one which seems more probable placed it at 2,268,000. For further details of population, see preceding YEAR BOOK. La Paz had a population in 1915 of 100,097; Cochabamba, 31,000; Sucre, 30,000; Potosi, 30,000; Oruro, 23,000.

EDUCATION. No later figures for education were available than those given in the preceding YEAR BOOK. Primary education is free and compulsory and the number of elementary schools in 1915 was 426, with 3960 teachers and 51,162 pupils. Secondary instruction was supplied by 21 colleges, 5 private lycées and 5 clerical institutions, with 180 teachers and 2598 pupils; higher education by 19 institutions with 78 professors and 1291 students. There are two universities, at Sucre and La Paz, and there is a

national conservatory at La Paz to which was added in 1917 a war college for officers. In 1916 the government spent 2,562,468 bolivianos for education.

PRODUCTION. Agriculture is in a backward condition though mainly sufficing for local needs. The land under cultivation has been estimated at 4,940,000 acres which will be increased as the result of measures for irrigation by artesian wells recently undertaken. The chief crops include wheat, corn, barley, beans, potatoes, and other vegetables, but the chief commercial crop is rubber of which the exports in 1915 were placed at 5081 metric tons. The main resources of Bolivia are mineral and include silver, tin, copper, lead, zinc, antimony, bismuth, gold, wolfram, and borate of lime. The following table gives the weights and values of mineral exports in 1917:

	Kilograms	Bolivianos
Tin ore	46,430,414	85,258,482
Copper	37,444,900	11,921,147
Wolfram	3,890,534	10,810,291
Lead ore	4,117,698	1,514,914
Antimony ore	23,381,392	17,017,907
Bismuth ore	534,717	4,116,677
Zinc	427,047	580,780

The following report after an expert investigation of petroleum resources was published in 1919: The petroleum regions of Bolivia may be divided into two classes—one, the eastern, which is very rich although it has not been thoroughly prospected, comprises the whole eastern zone of Bolivia from Yacuiba on the south to Santa Cruz, where the petroleum gushers (especially at Parapetí near the boundary of the Department of Santa Cruz) are more or less in a state of formation, evidenced by a pure and clearer substance with 98 per cent of inflammable matter. In that region it is also found that the mountain ranges of Aguaraña, Sararenda, Charagua, and the mouth of the River Piray are especially rich in petroleum, from the place called Espejo to the southwest of Santa Cruz, where it appears in a liquid and clear state, without any bituminous odor, according to tests at the Bureau at La Paz where a sample of petroleum from Santa Cruz was found to be of superior quality. Just parallel to these mountain ranges is located Inca-Hausi, where petroleum is also to be found although in smaller quantities. In this same zone are the excellent petroleum deposits of the Province of Azero in the Department of Chuquisaca.

The western zone shows unmistakable evidences of the presence of petroleum from the regions of the Río Grande de Mizque, to Apillapampa, Ayoma and Campinota, where it disappears under the rocks to reappear again and again from Amborí to the west of Santa Cruz, to Caupolicán, this zone comprising the districts of Chaparé, Ayopaya, and Arque, of the Department of Cochabamba, and those of Caupolicán and Nor Yungas of the Department of La Paz. Further to the west are to be found lubricating oils and also evidence of the presence of petroleum in the districts of the Province of Pacajes, on the border of Calacoto.

COMMERCE. The imports for 1917 were 33,480,825 bolivianos, and the exports, 157,748,050 bolivianos. In 1916 Great Britain held the chief place in the total foreign trade, and the United States the second, although the United States

was first in respect to the imports. The Bolivian imports and exports for the five-year period of 1914-18, inclusive, were as follows: 1914, bolivianos 105,562,368 (1 boliviano = approximately \$0.39); 1915, bolivianos 117,784,917; 1916, bolivianos 132,583,015; 1917, bolivianos 191,228,885; and 1918, bolivianos 217,612,737. The general total of national products exported in 1918 amounted to 120,710 metric tons, worth 182,612,850 bolivianos and taxed by the customs for 8,241,615 bolivianos, as against 151,797 metric tons, worth 157,748,054 bolivianos, and taxed by the customs for 5,866,966 bolivianos, in 1917.

RAILWAYS. The following statistics of railways were supplied by the *Pan-American Union* in 1919: The length of Bolivian railways in operation in 1918 was 1689 kilometers, while those under construction had a length of 571 kilometers, as is shown in detail as follows: Lines in operation: The Antofagasta and Bolivian Railway Co., Antofagasta to Oruro, 486 kilometers; Viacha to La Paz, 29 kilometers; and the Kenko Branch, 8 kilometers, or a total of 523 kilometers. The Huanchaca Bolivia Co., branch of the principal line, Antofagasta, Uyuni, Huanchaca, 38 kilometers. The Bolivian Railway Co., Viacha-Oruro, 202 kilometers; Rio Mulato-Potosi, 174 kilometers; Oruro-Cochabamba, 205 kilometers, and Uyuni-Tupiza to Atocha, 90 kilometers, or a total of 671 kilometers. Electric Light and Power company, Quillacollo-Cochabamba, 18 kilometers, and Cochabamba-Arani, 60 kilometers, or a total of 78 kilometers. Arica to La Paz Railway, Arica Alto de la Paz, Bolivian section, 233 kilometers. The Peruvian Corporation, Guacui-La Paz, 98 kilometers. Simón I. Patiño, Machacamarcá to kilometer 40.4, Corocoro branch (property of the state); branch of the main line from Arica, 8 kilometers. The lines under construction were: Simón I. Patiño, Machacamarcá-Uncia, 64 kilometers; State railways, La Quiaca-Tupiza, 100 kilometers; Potosi-Sucre, 178 kilometers; La Paz-Yungas, 125 kilometers; Uyuni-Tupiza (nearly completed), 104 kilometers, or a total of 507 kilometers.

During the year arrangements were concluded between Bolivia and Argentina which it was expected would expedite work on the proposed railroad from Formosa, Argentina, to Cochabamba, Bolivia. The line as planned in 1919 was to have 500 kilometers (311 miles) in Argentina and 850 kilometers (528 miles) in Bolivia. English engineers had been engaged on the survey, and construction was to begin as soon as the railroad material market should have returned to normal conditions.

This line when finished will open up the rich forest lands of the Bolivian and Argentine Chaco, and would also place the Bolivian montaña in easy communication with Buenos Aires via the extension from Formosa to Embarcacion, and will be of great advantage to Santa Cruz, an important city of eastern Bolivia. In addition, this line would provide another transcontinental railroad, for at Cochabamba, a junction would be made with the Antofagasta Railroad.

During the year plans were prepared also for the construction of the last sections of the Potosi-Sucre Railway. The total length of the line was 170 kilometers (105.63 miles) of which 50 kilometers (31.1 miles) were practically ready for service in 1919.

FINANCE. The standard of value is gold and the monetary unit is the boliviano whose par value is 38.932 cents. Revenue for 1918 estimated at 32,586,875 bolivianos, and expenditure at 36,145,250; revenue for 1919 31,328,767 and expenditure, 28,471,853. The public debt reported June 30, 1918, amounted to 67,572,378 bolivianos of which 39,808,752 were external; 21,662,436 internal; and 6,101,183 floating.

ARMY. The law of Dec. 15, 1915, provides for the military system which requires a permanent force of 3577, service being compulsory between the ages of 19 and 50, and including six years in the first line, five in the ordinary reserve, 10 in the extraordinary reserve, and 10 in the territorial guard.

GOVERNMENT. The legislative power is vested in a Congress of two Houses, the Senate and the Chamber of Deputies, the former consisting of 16 Senators elected for six years, and the latter of 70 Deputies elected for four years, both by direct vote of the people. The executive power is vested in a president elected for four years by direct popular vote, and ineligible for re-election, and the ministry of six members for the following departments: Foreign relations; worship, finance; government; public works; justice and industry; war and colonization; and education and agriculture. Two vice-presidents are elected along with the President and for the same term. The President at the beginning of 1919 was Señor José Gutierrez Guerra, elected for the term 1917-21.

BOLSHEVIKI, BOLSHEVISM. See *WAR OF THE NATIONS*, and articles on countries under *History*.

BOOTS AND SHOES. This industry in the United States in 1919 reestablished itself on a peace basis and many of the plants that had been working on war contracts readjusted themselves to the former conditions. The increasing prices for leather and labor naturally were reflected in higher prices for shoes and while there was complaint from consumers the production was readily absorbed. It was argued that in this as in other lines the purchasing public represented by workers were in receipt of high wages and demanded the best grades of foot wear for which they were ready to pay high prices. As an example of the American boot and shoe industry in 1919 the case of Brockton, Mass., may be cited. Local figures of production gave the 1919 output as 759,353 cases as compared with 679,023 cases shipped from Brockton in 1918. Reduced to pairs this would be 18,983,800 pairs valued at \$142,378,500 in 1919 as against 16,975,575 pairs in 1918 valued at \$95,063,200 or an increase of some 2,000,000 pairs and a value of \$47,000,000. In 1919 there were 13,404 union workers in the city as compared with 11,902 in 1918. At the end of the year the U. S. War Department announced that it had declared surplus and proposed to offer for sale to the public through the retail stores of the Quartermaster's Department 1,900,000 pairs of shoes made on the Munson last. This was the first offer to sell new army inspected shoes and included the marching shoes offered at \$8.25 a pair; a heavy weight metallic fastened shoe for field use offered at \$7.50 per pair and a welt shoe offered at \$7.50. This announcement was made after the statement that the General Staff of the army had adopted a universal shoe for field, marching, and dress uses. This new shoe also was to be made

on the Munson last, but with certain modifications of the previous specifications.

BORDEN, SIR ROBERT LAIRD. Canadian representative at the Paris Peace Conference. He was Prime Minister of Canada and Secretary of State for External Affairs. He had been a barrister by profession and practiced in Halifax. Entering politics he was elected to the Canadian House of Commons in 1896 and led the opposition from 1901 to 1911, when he won in the general election against Sir Wilfred Laurier. He showed remarkable energy during the war and conducted affairs with moderation and tact, as was illustrated by his bringing about a coalition with the pro-conscription Liberals. He was a strong advocate of an imperial war cabinet. See preceding YEAR BOOKS.

BORLAND, WILLIAM PATTERSON. Congressman from Missouri, died in France, February 20. He was born at Leavenworth, Kan., Oct. 14, 1867. He studied law at the University of Michigan and practiced in Kansas City after 1892. He was a member of Congress from 1909 to 1919. From 1895 to 1909 he was dean of the Kansas City Law School.

BORNEO. See EXPLORATION.

BOSNIA AND THE HERZEGOVINA. Former provinces of the Ottoman Empire which passed over to Austria-Hungary in 1908 and which after the disruption of the empire in November, 1918, formed a part of the new southern Slav state of Jugo-Slavia (q.v.). Area, 19,768 square miles; population, according to the census of Dec. 31, 1910, 1,898,044.

BOSTON SYMPHONY ORCHESTRA. See MUSIC, *Orchestras and Novelties*.

BOSTON UNIVERSITY. A non-sectarian institution of learning, founded in 1869 at Boston, Mass. In the fall of 1919 there was the following enrollment: college of liberal arts, 599; college of business administration, 2653; college of secretarial science, 602; department of religious education and social science, 211; school of theology, 220; school of law, 311; school of medicine, 94; school of education, 182; teachers' courses, 411; graduate school, 28. There were 383 students at the summer session of 1919. The faculty numbers 364. Productive funds amounted to \$3,212,448 and the income for the year was \$160,000. The library of the university contains 62,282 volumes. The university has substituted for the S. A. T. C. a unit of the R. O. T. C. President, Lemuel Herbert Murlin, D.D., LL.D.

BOTANY. The American Association for the Advancement of Science held its 72nd annual meeting at St. Louis, Mo., Dec. 29, 1919, to Jan. 3, 1920, with the Botanical Society of America, the American Phytopathological Society and other affiliated societies meeting at the same time. The British Association, which had held no meeting since 1916, met at Bournemouth September 9th to 13th. The Spanish Association for the Advancement of Science met at Bilbao September 7th to 12th. At all these meetings botanical subjects occupied prominent places in the programmes. The fifth Annual Conference of Cereal Pathologists held an important meeting at St. Louis, Mo., June 5 to 7,

1918. A field meeting of Plant Pathologists was held on Long Island, N. Y., June 24th to 27th, to study the leaf roll and mosaic diseases of potatoes. In addition to many pathologists from this country and Canada several were in attendance from European countries.

A conference of western Plant Pathologists was held in Portland, Ore., April 23rd and 24th to consider means for the prevention of the spread of the white pine blister rust into the western mountain and coast regions. A Canadian Branch of the American Phytopathological Society was established during the year. *Genetica*, a journal devoted to plant and animal breeding, was established under the editorship of Dr. J. P. Lotzy. An Institute for Phytopathological Research has been created in connection with the famous Rothamsted Experiment Station at Harpenden, England.

As an outgrowth of the War Emergency Board, established in 1917 by the American Phytopathological Society, there has been formed a permanent Advisory Board consisting of six members, who represent various regions of the United States and Canada, to advise with the National Research Council, encourage coöperation among investigators, arrange for conferences, promote international relations in phytopathology, etc. The Plant Disease Survey, inaugurated by the United States Department of Agriculture, has continued to collect data regarding the crop losses due to plant diseases and the aggregate for the year 1918 was very large. Much of the loss could have been prevented by the wide adoption of well known control measures.

Three additional plant quarantines were promulgated by the Secretary of Agriculture during the year on account of plant diseases. Under quarantine No. 37, which became effective June 1, 1919, the importation of nursery plants, seeds, etc., is prohibited except under regulations of the Federal Horticultural Board. Quarantine No. 38 prevents the interstate shipment of the common barberry and related plants on account of their being alternate hosts of the stem rust of wheat; and No. 39 prohibits the importation of wheat, rice, and related cereals from certain countries on account of the presence of the flag smut (*Urocystis tritici*) and take-all (*Ophiobolus graminis*).

Among botanists whose deaths were reported within the year were: Dr. W. G. Farlow, for many years Professor of Cryptogamic Botany at Harvard University; R. Farneti, plant pathologist of the University of Pavia; C. de Candolle, Swiss botanist and editor of *Prodromus*; Dr. G. Klebs, professor of botany of the University of Heidelberg; C. G. Bancroft, government botanist of British Guiana; H. Léviellé, founder of the Académie Internationale de Géographie Botanique; Dr. P. Baccarini, director of the Botanic Gardens at Firenze; Dr. S. Schwendener, honorary president of the Deutsche Botanische Gesellschaft; Dr. G. S. West, botanist of the University of Birmingham, England, and Professor J. W. H. Trail, botanist of the University of Aberdeen, Scotland.

The amount of botanical literature that came to hand during the past year was unusually large. This, in part, is due to the arrival of issues withheld during the war, and to the fact that many workers were forced to suspend investigations which gave time for the preparation and publication of long deferred papers.

ECOLOGY. Cowles, in an interesting paper presented to the Association of American Geographers gave data regarding the past and present climate of our leading crop plants. Most of them are said to have originated within tropical or subtropical regions and many are now grown almost exclusively outside the tropics. It is believed that mutation or acclimatization, rather than change in climate, is responsible for the change in habitat of most crop plants. As having a bearing not only on ecology, but also on agriculture, Hartwell and associates have shown the injurious effects that some crops have on those which immediately follow them. The effect is considered not to be due to the exhaustion of plant nutrients, but rather to the influence exerted on soil acidity. Sampson has described a method of estimating range depletion and renewal based on a study of plant successions in national forests.

Harvey claims that subjecting plants for a few days to temperatures a little above freezing hardens them so that they will withstand freezing temperatures for a short time. The hardening process is said to cause changes in the protoplasm, such as increase of hydrogen-ion concentration and increased salt content, which prevents the precipitation of the protoplasm. The effects of desiccation, freezing and plasmolysis, are considered to be quite similar in their manifestation. Arrhenius and Soderburg report that plants on high mountains have high osmotic pressures, corresponding to the concentration of the cell sap and that this, within limits, protects the plants from injury by frost. The value of standard plants as indicators of soil and climatic possibilities is becoming recognized. Clements, Weaver, and others have adopted for this purpose such plants as wheat, oats, sun-flower, and raspberry. These grow under widely varied conditions and they have been found especially valuable for comparative studies on transpiration and growth. The determination of their photosynthetic efficiency may lead to their use in field and forestry studies where light and shade are important factors.

Griggs has given an account of the vegetation of Kodiak Island, following the eruption of Mount Katmai in 1912, when herbaceous vegetation was suppressed by the fall of ash. The ash has little fertilizing value, but where it has become mixed with the old soil the physical condition of the soil was improved and the vegetation greatly stimulated. Gail found light the controlling factor in the vertical distribution of *Fucus* in Puget Sound, well grown plants undergoing decomposition and death when placed a meter below the surface of the water. The United States Weather Bureau has prepared charts showing the rest periods of many of the common plants of the United States, based on the average time between fall and spring when the mean temperature is below 49° F.

PLANT BREEDING. A large number of contributions to the genetics of important crop plants were published during the year only a very few of which can be noted. Knowlton has described a fossil species of maize from Peru which is believed to offer additional evidence as to the antiquity of maize. Collins, referring to this fossil, says it presents no new characters, but rather a different combination of characters found among existing types. Roberts has called attention to a paper by McCluer published in

1892 in which are described the results of corn breeding experiments, the vigor of first generation hybrids, inheritance of endosperm color, etc., being commented upon.

Harland has reported on work with Sea Island cotton in which the inheritance of resistance to blister rust in one series and great productivity in another are claimed. Weatherwax, from a study of maize and some of its related forms, claims the theory of the hybrid origin of maize is not in accord with the morphological facts. He thinks that *Zea*, *Euchlœna* and *Tripsacum* have descended independently from an ancestral type that is now extinct. Shaw and Norton have published the results of eight years' study on the inheritance of color in garden beans. In general, crosses of white and pigmented beans show a ratio of 3:1 but there are many wide departures from this proportion.

East, from a study of intercrosses of self-sterile plants of *Nicotiana*, found the behavior in intercrosses is governed by factors which act through the pollen; also that the gametes of plants having like constitutions as regards effective factors may be incompatible in that they do not make normal pollen tube growth and hence do not reach the ovary in time for fusion to occur. The growth of the pollen tubes is not inhibited by substances secreted by the pistil, but when compatible crosses are made substances are secreted which accelerate the pollen tube growth, enabling it to reach the ovary and fertilize the ovules before wilting takes place.

Macfarlane, from a study of phenological data relating to blooming, shedding of pollen, defoliation and climatic resistance, found hybrids show a blending of these characters intermediate to those of the parent plants. De Vries has added to his contributions on mutation by describing *Eurothera rubrinervis* which he characterizes as a half mutant. Blakeslee described a mutant of the jimson weed (*Datura stramonium*) some of the variations from which are inherited in a method not in accord with the Mendel theory. Collins has given an account of a half white and a half purple mutant in a maize hybrid. The F_2 progeny of this grain gave approximately a di-hybrid ratio in respect to the aleurone color character. Reports have been given by Shamel, Scott, and Pomeroy of their work in citrus improvement through bud selection. Numerous distinct strains of navel and Valencia oranges and Marsh grape fruit are said to have been isolated by bud selection. La Rue and Bartlett claim that in mutations involving size in the entire plant, the number and arrangement of the cells are changed and not the size of the individual cell.

PHYSIOLOGY, ETC. Osterhout and Haas conclude from a study of *Ulva* that photosynthesis begins as soon as the plant is exposed to light, and that the rate increases until a constant rate is attained. It is assumed that sunlight decomposes a substance in the plant the products of which either catalyze photosynthesis or enter directly into the reaction. Klebs claims that light is the dominating factor in determining photosynthetic activity and that the inhibiting effect of high temperatures can be annulled by increased light intensities.

Spoehr and Long consider photosynthesis to be closely related to sugar content and the respiratory activity of the leaf. It was found that leaves with greatly depleted carbohydrate sup-

plies show a very low rate of carbon dioxide fixation when first exposed to light. The rate, however, rises with increased carbohydrate content until a maximum is reached. Ewart claims that in the assimilation of carbon dioxide, chlorophyll acts as a light energizing enzyme and takes a direct part in the cycle of chemical changes which probably have carotin, xanthophyll, phytol and glaucophyllins as immediate products and glucose, levulose, formaldehyde and oxygen as end products. Sugar may be found directly or through the polymerization of the formaldehyde.

Osterhout and his associates have shown that anesthetics, when applied in sufficient amount to cause any effect on plants, first cause a rise in respiration followed by a decline. This is held to be opposed to the theory of Verworm that anesthesia is a kind of asphyxia due to the checking of respiration. Langdon reports that carbon monoxide is a regular respiration product of the kelp, *Nereocystis leucaleana*. It is present in the pneumatocysts and is found only when oxygen is present. Meyer, in accounting for the progressive change in the color of the leaves of the garden nasturtium from the dark green of the young leaves to the yellow when old, claims it is due to the gradual decomposition of the chlorophyll while the carotin and xanthophyll remain constant. With the loss of chlorophyll there is a similar decomposition of the proteins of the chloroplast.

Osterhout has found striking agreement as regards the important aspects of permeability, antagonism, injury and recovery, and death. He has found additional evidence to support the hypothesis that the antagonistic relations of salts, alkaloids, etc., can be predicted from studies of permeability. Based upon a study of the resistance of root tips of *Vicia faba* to electric currents, Small claims that geotropic response depends on changes in permeability. Preliminary experiments by Lamkey seem to indicate that permeability and plant food availability are dependent to some extent on temperature, shade, sunlight, and soil moisture content.

Loeb has added to his contributions on inhibitory substances in plants and claims that in regeneration, apical leaves accelerate root formation in the basal portions of stems in proportion to the mass of the leaf. Reed and Halma have found growth inhibiting substances in twigs of the Chinese lemon, growing shoots near the apex inhibiting the development of buds lower on the stem. Horizontally placed stems develop the buds on the upper side only. Appleman has summarized his results and shows that growth inhibiting substances play an important part in the production of sprouts on the potato tuber. Free, Lloyd, and others have continued studies on the colloidal phenomena of protoplasm in relation to permeability and growth. MacDougal has given a conception of growth in organisms. Living matter is composed mainly of pentosans and albumins, or albumin derivatives, with lipins as a minor component and growth of living matter consists of hydration, with accompanying swelling, and the accretion of solid matter.

MISCELLANEOUS. Chamberlain has summarized the available data regarding chondriosomes, and claims they are definite entities within the cell that multiply by division, some giving rise to plastids. Their rôle in heredity remains to

be demonstrated. Magnus, from a study of wound callus and bacterial tumors in plants, found evidence that indicates the tumor inducing organism in plants is not identical with that in animals but he believes that studies on tumor formation in plants will ultimately throw light on cancer development in animals.

Based on a study of the flagellae on the nodule producing bacteria, Hansen claims they fall into two distinct groups. Experiments conducted at the Minnesota Experiment Station on the resistance of wheat to the stem rust, *Puccinia graminis*, seem to indicate that the hydrogen-ion concentration of the cell sap does not play an important rôle in resistance to this fungus. Panatelli claims that resistance to freezing in plants is not due to the concentration of the cell sap or to the salt content, but is due to the proportion of sugar the cells are able to conserve during the cooling process.

Bates has described a new evaporimeter which is claimed to give the nearest approach yet attained to the duplication of the physical response of the plant leaf to the factors which are involved in evaporation studies. Bosc has devised a form of apparatus by which small movements are greatly enlarged making it possible to record the growth of plants and their responses to stimuli during very brief intervals of time. Shreve has perfected an apparatus for measuring the surface temperature of leaves and is able to measure fluctuations of 1 to 3° C. in 20 to 30 seconds of time.

PLANT DISEASES. Plant diseases took a heavy toll in the crops of the United States according to a recent report of the Plant Disease Survey, United States Department of Agriculture. The estimated reduction, due to plant diseases in 1918 for a number of crops, was: Wheat, 33,171,000 bushels; oats, 64,396,000; corn, 158,533,000; potatoes, 78,094,000; sweet potatoes, 47,136,000; tomatoes, 801,763,000; apples, 19,273,000; and peaches, 1,490,000 bushels. The cotton crop suffered losses amounting to 2,160,000 bales from the same causes.

Congress, in making appropriations for the Department of Agriculture for the year ending June 30, 1920, provided practically \$1,250,000 for the investigation of plant diseases, experiments for their control, for the application of control and eradication measures and for quarantines against the introduction of diseases from without the country or the spread of some already present.

One of the most important events was the discovery of the diseases of wheat and other cereals known as take-all and flag smut. These diseases were found in a few counties of Illinois, and take-all in two or three localities in Indiana. Nothing is known regarding their introduction into the country. Both diseases cause serious losses in Australia and other countries, and prompt measures were taken for their eradication. The black wart of potatoes, due to *Chrysophyctis endobattica*, first reported in this country in the anthracite coal region of Pennsylvania in 1918, was found in 1919 in a few localities in the bituminous coal regions of southwestern Pennsylvania and West Virginia.

The white pine blister rust caused by *Peridermium strobi* continues to give concern to forest pathologists and others. It is known to occur from New England to Minnesota and efforts are being made to control it by the destruc-

tion of currant and gooseberry bushes which serve as the alternate hosts of the fungus. The campaign for the eradication of citrus canker in Florida by burning affected trees seems to be successful and the same methods are being adopted in South Africa where the disease has appeared.

The mottling disease of sugar cane, which was reported as a menace to the sugar industry in Porto Rico in 1918, has also been found in some of the principal cane growing regions of the United States. The importance of some rots of roots, stalks, and ears of corn are becoming recognized and Hofer has found that some forms are due to *Gibberella* spp. organisms which also cause scab of wheat.

Bibliography. Among recent botanical books the following are noted: C. E. Babcock and J. L. Collins, *A Laboratory Manual of Genetics* (New York, 1918); J. W. Bews, *The Grasses and Grasslands of South Africa* (Pietermaritzburg, 1918); F. O. Bower, *Botany of the Living Plant* (London, 1919); M. T. Cook, *Applied Economic Botany* (Philadelphia, 1919); L. J. Dalbis, *Anatomie et Physiologie végétales* (Paris, 1918); E. M. East and D. F. Jones, *Inbreeding and Outbreeding* (Philadelphia, 1919); G. S. M. Ellis, *Applied Botany* (London, 1919); C. S. Gager, *A Laboratory Guide for General Botany* (Philadelphia, 1919); K. R. Kintikar and B. D. Basu, *Indian Medicinal Plants* (Allahabad, 1919); J. M. Macfarlane, *The Causes and Course of Organic Evolution* (New York, 1918); J. N. Martin, *Botany for Agricultural Students* (New York, 1919); R. C. Punnett, *Mendelism* (fifth edition, London, 1919); W. H. Rankin, *Manual of Tree Diseases* (New York, 1918); R. E. Smith, E. O. Essig and G. P. Gray, *Handbook of Plant Disease and Pest Control* (Berkeley, Cal., 1918); J. E. Weaver, *Ecological Relations of Roots* (Washington, 1919); and R. Willstätter and A. Stoll, *Untersuchungen über die Assimilation der Kohlensäure* (Berlin, 1918).

BOTHA, LOUIS. Boer General and statesman, died in Pretoria, S. A., August 28. He had distinguished himself throughout the war and after its close by his staunch support of the Allied cause, and his loyalty to the British Empire. He was born in Greytown, Natal, in 1862, and won renown in the Boer War, 1899-1902, where along with De Wet he became one of the greatest figures of the war. He was field cornet under General Meyer and rose rapidly to a high rank. He commanded at the siege of Ladysmith, defeated the enemy at Colenso, and in 1900 attained the command in chief. He succeeded with his inferior forces in dragging out the war for many months after the fall of the South African republics, and although the capital, Pretoria, was captured, he did not surrender until 1902. He then carried on with the British government the peace negotiations, and believing the cause of independence hopeless, accepted the policy of conciliation, and became the chief of the Unionist party of South Africa. He was the first Prime Minister of the Union of South Africa and during all the latter years of his life exerted a powerful influence in politics—always on the side of stability. In spite of the break in his own party, in 1913, he continued to hold the leadership. Under his command-in-chief the South African forces took a remarkable and important part in the War of the Nations. Within a few months success was made sure, and in

July, 1915, all the German forces in Southwest Africa surrendered. In 1919 he visited Paris as the first delegate from the Union of South Africa, but had returned home in order to direct the political campaign for the elections. As the leader of the Union he was constantly involved in contests with General Herzog, the champion of complete South African independence.

BOTULINISM. See FOOD POISONING.

BOURGEOIS, LÉON. French representative at the Paris Peace Conference. He was born in Paris, 1851, and was a lawyer by profession and a Radical in politics. Having a logical and impartial mind he was frequently called upon in inter-party and international affairs where arbitration or compromise was required. In 1888 during the Boulangist affair he entered politics and defeated Boulanger in the election by an overwhelming majority. His advice was frequently asked in times of cabinet crises and on one occasion after the attempt on the life of President Loubet he succeeded in forming a cabinet after all others had failed. He was devoted to the interests of international peace and prominent in connection with the measures of peace and arbitration which centered at The Hague. His experience along this line caused him to be selected by the government as the head of the foreign office committee to deal with the League of Nations.

BOURNE, FREDERICK GILBERT. Capitalist, died at Oakdale, Long Island, March 9. He was a prominent organizer of the sewing machine industry and the director of the Singer Manufacturing Company besides holding directorates in other important business enterprises.

BOWDOIN COLLEGE. Founded in 1794 at Brunswick, Me. The enrollment for the fall of 1919 was 448, and there were 29 members in the faculty. The productive funds of the college amount to \$2,631,012 and the income for the year was \$137,137. The library contains 120,000 volumes. President, Kenneth C. M. Sills.

BOWLING. The nineteenth annual tournament of the American Bowling Congress was held at Toledo, Ohio, ending April 1st. H. Cavan, Pittsburgh, won the individual championship with a score of 718. A. Pollard, Indianapolis, was second, with 714. The other winners were: Doubles, Kalush and Barnes, Rochester, with 1305; five-man team, Atherton Hotel, Oshkosh, Wis., with 2992. In the women's championships, contested on the same alleys, the individual honors went to Mrs. B. Husk, Newark, N. J., with 594. Other winners were: Doubles, Mrs. G. Butterworth and Mrs. F. Steib, Chicago, with 1042; five-woman team, Minor Butlers, Toledo, Ohio, with 2436.

E. Baumgarten, Chicago, captured the individual title at the International Bowling Association tournament, held at St. Paul in February, with a total of 631. Other results were: Doubles, W. Metcalfe and E. Matak, St. Paul, 1204; five-man team, Schmidts, St. Paul, 2815.

BOXING. The principal happening in the boxing realm in 1919 was the knocking out of Jess Willard, heavyweight champion of the world, by Jack Dempsey at Toledo, Ohio, on July 4th. The match was promoted by Tex Rickard and although the attendance, 19,650, was a big disappointment, the receipts amounted to \$410,732.16, exclusive of the war tax. Willard received \$100,000 for his share of the purse while Dempsey collected \$27,500. The war tax

amounted to \$41,789.94. The ring battle lasted only three rounds, Willard being unable to continue longer because of the severe punishment he had sustained from the very outset.

The victory achieved by Georges Carpentier, the French heavyweight, over Joe Beckett, British champion, was another sensational occurrence of the year. This bout was staged in London on December 4th. Beckett was sent down for the count in the very first round, although he entered the ring a pronounced favorite over the Frenchman. The victory of Carpentier was welcomed by followers of boxing throughout the whole world with the greatest enthusiasm, chiefly because of his long and creditable military service with the armies of the Allies.

Carpentier, through his manager, has challenged Dempsey to defend his world championship title, and the two will probably meet some time in 1920. This battle will probably take place in America and New York City will almost certainly be the place selected if the State Legislature restores professional boxing as is expected.

In other classes few changes took place during 1919. Jack Britton took the welterweight title from Ted Lewis, but the other champions clung to their laurels. Benny Leonard reigned supreme among the lightweights despite his many bouts, and it would appear that the only manner in which he can be deposed is by his becoming too heavy for his particular class.

The championships of the Amateur Athletic Union were held at Boston, Mass., April 7th and 8th. The results of the final bouts were: 108 pounds, D. Kamins, Clark House A. A., New York, defeated James Manning, South Boston, three rounds; 115 pounds, Ashton Donze, Y. M. C. A., New Orleans, La., defeated James Tomasulo, Elizabeth Y. M. C. A., three rounds; 125 pounds, William P. Corbett, Somerville, defeated Archie Walker, Rutgers Gymn. A. A., New York, three rounds; 135 pounds, Frank B. Cassidy, Ozanam Assn., New York, defeated John Hepburn, Fore River A. A., three rounds; 145 pounds, Dave Rosenberger, Glencoe A. C., New York, defeated Emile Franzer, National Turnverein Newark, three rounds; 158 pounds, Sam Laconia, Bronxdale A. C., New York, defeated J. J. Flanagan, Brockton, three rounds; 175 pounds, Al Roche, Somerville, defeated Frank Gravier, Willow A. C., Pittsburgh, four rounds; heavyweight, Edward P. Egan, Denver A. C., defeated James Tully, West Side A. C., New York, three rounds. See ATHLETICS.

BOYS' CLUB WORK. See AGRICULTURAL EXTENSION WORK.

BOY SCOUTS OF AMERICA. A movement in this country similar to the Boy Scout movement in Great Britain headed by Sir Robert Baden-Powell. It is an organization to develop character, initiative, and resourcefulness in boys by cultivating their interest in activities of practical every-day value through their interest in the fascinating outdoor activities of the Scout programme, under carefully selected leadership. They number throughout the world several million. In the United States on Dec. 30, 1919, there were 373,174 scouts properly registered in 16,768 troops, with 102,020 men council members, troop committeemen and scoutmasters. The organization is growing at the rate of about 235 registrations a day.

The Boy Scouts are neither military nor anti-military in organization, the uniform, drill, etc.,

having no military object, but aiming only at bringing about harmony and *esprit du corps*. Each applicant for membership must take the following oath: "On my honor I will do my best—1. To do my duty to God and my country, and to obey the Scout Law; 2. To help other people at all times; 3. To keep myself physically strong, mentally awake, and morally straight." Character development manifests itself in health, efficiency, chivalry, loyalty, patriotism, and good citizenship, which is the key note of the movement. Scouts are organized in patrols, of eight boys each, four patrols to a troop. Each troop is under a scoutmaster and one or more assistants holding commissions from the National Council of the Boy Scouts of America. Troops are usually connected with churches, schools, or other established institutions, and must be chartered by the National Council. Scoutcraft includes instruction in first aid, life saving, tracking, signaling, cycling, nature study, seamanship, campercraft, woodcraft, chivalry, and all the handicrafts. Special merit badges are awarded for excellency in many things such as photography, gardening, chemistry, bird study, automobiling, firemanship, radio telegraphy, and forestry. Scouts are of the Tenderfoot, Second Class, and First Class rank, according to the stage of advancement. "Be Prepared" is the Scout motto, and service is the great ideal of the movement. Scouts are pledged "to do a good turn daily."

During the war, the Boy Scouts rendered valuable service to the government as the following figures will show: In the four Liberty Loans they sold 1,867,047 subscriptions, amounting to \$278,744,650; War Savings Stamps sold to April 10, 1919, \$42,751,031.25; 5200 carloads of standing walnut lumber were located; 100 carloads of fruit pits collected for gas masks; 12,000 war gardens and farms were conducted; 30,000,000 pieces of government literature were distributed; conducted confidential service for the Third Naval District; as well as having co-operated with nearly every public service organization, as for instance, the Red Cross, the American Library Association, the United War Work Committee, the Food and Fuel Conservation committees. Gen. John J. Pershing sent a letter of appreciation of the work of the Boy Scouts to Mr. Colin H. Livingstone, the president of the National Council.

The ninth annual meeting of the National Council was held in New York City on March 24, 1919. The report for 1918 was received and plans were discussed for the following year. Active work is being done in regard to the introducing of courses for scoutleaders in leading universities. So far 12 universities have introduced courses, such as Columbia University, University of Wisconsin, Yale University, Boston University.

A new feature of the Boy Scouts is an organization of Sea Scouts under Capt. James A. Wilder. Sixty-nine organizations had been started up to March, 1919, and many more were expected to enroll within the year.

Boys' Life is the official organ of the National Council, having a monthly circulation of over 100,000 copies. To December, 1918, a total of 1,165,400 copies of the *Handbook for Boys* had been sold.

The Boy Scouts of America was incorporated Feb. 8, 1910, and chartered by Act of Congress,

June 15, 1916. Its honorary president is President Woodrow Wilson; honorary vice-presidents are the Hon. Wm. H. Taft and Daniel Carter Beard. The active officers are: President, Colin H. Livingstone; treasurer, George D. Pratt; National Scout Commissioner, Daniel Carter Beard; Chief Scout Executive, James E. West. Headquarters are in New York City.

BRACKETT, WALTER M. American painter, died at Boston, Mass., March 4. He was born at Unity, Me., June 14, 1823; began painting portraits in 1843 but later devoted himself to the study of game fish. He was an exhibitor for 50 years in exhibitions in the United States and abroad. His work was well known and widely distributed.

BRAHAM, JOHN JOSEPH. American composer and orchestra leader, died at Brooklyn, N. Y., October 28. He was born in England, in 1848, came to America in 1859, and three years later made his appearance as a violinist at a New York theatre. He was subsequently musical director at several theatres in New York and elsewhere, and for a time was in charge of the Boston Museum Orchestra. He was director of the first performance of *Pinafore* in the United States, and he wrote the music for *Hawatha* and other well-known productions.

BRAINARD, OWEN. Architect and civil engineer, died in New York April 2. He was born at Haddam, Conn., March 10, 1865, became chief engineer of Carrere and Hastings, 1893, and was admitted to partnership, 1901. Among his works are the New York Public Library, the Yale bi-centennial buildings and Century Theatre in New York and other well-known buildings.

BRARD, MAGDELEINE. See MUSIC, Artists, Instrumentalists.

BRATIANO, JEAN. Rumanian representative at the Paris Peace Conference. He was the Prime Minister of Rumania. He was the son of the well-known Rumanian statesman, who had secured the adoption of the constitution of the united principality, and invited Prince Charles to accept the throne in 1866. From the beginning of the war he was a strong supporter of the Allies, but maintained neutrality until the time came for taking sides. In his administration was concluded the treaty with the Allies which resulted in Rumania's entry into the war in 1916. His courage after the defeat by Bulgaria was highly praised. He had been a leader of the Liberal party.

BRAZIL, UNITED STATES OF. South American country, constituting a federal republic, the largest state on the continent. Capital and largest city, Rio de Janeiro.

AREA AND POPULATION. Area estimated by the Brazilian Ministry of Agriculture at 3,280,900 square miles, or an excess of more than 250,000 square miles over the area of continental United States, exclusive of Alaska. Another estimate places the area somewhat lower than this, namely, at 3,275,510 square miles. It comprises 20 states, the federal district, and one territory. Population according to the census of 1900, 17,371,069, and according to the estimates of 1917, 27,473,579, or an average density of 8.3 per square mile. The number of Indians in the Amazon area is estimated at 600,000. The chief cities with estimates of population in 1913 are as follows: Rio de Janeiro, 975,818; São Paulo, 450,000; Bahia, 348,130; Belém, 275,167; Pernambuco, 216,484. Immigration to Brazil

from 1820 to 1917 amounted to 3,428,651. In 1915 the immigrants numbered 30,287, of whom 15,118 were Portuguese, 6895 Spaniards, 5779 Italians. In 1918 the immigrants who entered the country through the ports of Rio de Janeiro, Paranaguá, Santos, and Rio Grande numbered 20,501, of whom 12,531 were males and 7970 females; 8182 classified as agriculturists and 7694 as laborers. In the autumn the government notified all consular officers in Brazil that aid would be gratuitously supplied to agricultural immigrants who were accompanied by their families. This included food, medical treatment, medicines, freedom from duties for baggage, agricultural machinery or tools for their profession, transport by rail or by water, or information by means of interpreters if necessary. If the destination of the immigrant was the federal colonies, they would receive in addition employment to the extent of 15 days' work a month for each adult, and other advantages. The land allowed to each settler was 25 hectares, or about 62 acres. The immigrant service undertook to provide temporary quarters for settlers who wished to build dwellings in the colonies.

PRODUCTION AND INDUSTRY. The country is agricultural but as yet only a small portion of the soil has been brought under cultivation. Coffee is by far the chief product of commerce, the State of São Paulo alone producing about one-half of the world's crop and the four States of São Paulo, Rio de Janeiro, Espírito Santo and Minas Geraes producing about four-fifths, although their area is only about one-eighth of the total area of the country. The average annual yield is over 12,000,000 sacks of 132 pounds each. The yield in 1917 was estimated at 846,480 tons. Rubber comes next, supplying about one-half of the world's production. The chief rubber-growing regions are in the forests of the Amazon basin and around Ceara, Para, and Manaos. The rubber tree is extensively cultivated under government encouragement. The rubber crop in 1917 was placed at 41,500 tons. Another crop in which Brazil leads the world is cacao, raised chiefly in Bahia and Espírito Santo though in parts of other states as well. Tobacco is also raised in those same states and the annual production is placed at about 50,000,000 kilos. The sugar crop has averaged about 300,000 tons. Cotton is raised chiefly in the northeast, the crop for 1917-18 being about 90,400 tons. Other crops of importance with their estimates in 1917 are as follows: Wheat, 2,421,031 metric tons; rice, 371,989; beans, 326,686; mandioca flour, 299,558. Mate is also raised, chiefly in Parana. The live-stock on hand, 1917, were as follows: Cattle, 8,443,400; horses, 1,407,600; mules, 351,900; sheep, 4,604,000; goats, 138,900. In the same year Brazil occupied the second place in the world's production of hogs, having 17,327,210 head as compared with 67,766,000 head in the United States which held the first place. The following summary of the President's message September 19 on reclamation and of the provisions of the law proposed on the subject were supplied by the United States Bureau of Foreign and Domestic Commerce.

Since 1877 more than a million inhabitants of northeastern Brazil are known to have perished from famine and its consequences. This fact represents not only human suffering, but the loss of an incalculable economic force to a nation only sparsely populated. The success of

other governments in dealing with waste and desert lands—and particularly the success of the British government in Egypt and India and of the United States government in its western irrigation projects—proves that there is a feasible solution for Brazil's problem. But the work of conserving and utilizing the water supply by means of great dams and reservoirs must be undertaken by the central government. The expenditure will be large and should not be dissimulated, but emphasis should be placed on the fact that, in the experience of other governments, a great part of this outlay is recoverable in a few years by the increased taxes resulting from the greater value of the irrigated lands and the larger prosperity of the people. The fear that there is not sufficient water to make great reservoirs useful in the States of northeastern Brazil is unfounded. A prolonged study of the rainfall in the State of Ceara, the least favored State in this respect, shows an annual precipitation of more than 80,000,000,000 cubic meters, 16,000,000,000 cubic meters of which could be collected and would serve for the irrigation of about a million hectares (about 2,400,000 acres) of land.

The foregoing statements summarize the arguments which President Pessoa of Brazil presented to the Brazilian National Congress on Sept. 19, 1919, when he recommended legislation to enable the government to undertake the reclamation of the arid lands of the Northeast. The provisions which he believed should be included in such a law were as follows:

(1) Authorization of the government to engage in credit operations to the maximum amount of 40,000 contos (\$11,000,000) per annum until not to exceed 200,000 contos (\$55,000,000) has been expended; these sums to be used for the construction and upkeep of large reservoirs, irrigation canals, and supplementary works in northeastern Brazil.

(2) The establishment of a fund, in addition to the foregoing, which will include the following resources applied to the service of interest and amortization of loans, as well as to the expenses of construction and upkeep of the work: (a) Two per cent of the general income of the Republic during the time necessary for the construction of the works; (b) from 2 to 5 per cent of the ordinary revenues of the States during the same period, payable by arrangement with the Federal government in cash or in public lands; (c) the proceeds from the sale of land ceded by the State and of the land which may be disappropriated; (d) the revenue from the irrigation works; (e) contributions or gifts from whatever other sources.

(3) Provision for the disappropriation of lands necessary for the construction of works, of the flooded lands, and of the forests necessary for the protection of springs.

(4) Provision for the construction of works by the administration or by contract with companies which have successfully executed works of this kind.

(5) Provision for the operation and administration of works by the Federal government until time of total repayment of the quantity expended.

(6) Establishment of an irrigation tax and a conservation tax for the upkeep of the works and determination of the terms of lease of disappropriated lands.

(7) Provision whereby the irrigated lands shall be subject to confiscation if the proprietors fail to cultivate them in accordance with the regulations issued by the government or to pay taxes during a period of two years, such confiscation to be made on the basis of the assessed valuation of the land without improvements.

(8) Preference to be given in the sale and lease of lands in favor of families of the resident farmers in the respective States in which lands are to be irrigated.

(9) Authorization to the government to regulate the operation of the funds, the collection of taxes, and the administration and operation of the works.

COMMERCE. Before the war exportations were limited to a few staple products including coffee, rubber, manganese, tobacco, mate, cocoa, raw cotton, cotton seed, building and cabinet woods, table fruits and carnauba. During the war however a variety of new markets were opened and the country was able to export for the first time certain products such as rice, chilled meat, Indian corn and cassava meal. The exports and imports by countries for the years 1913, 1917, and 1918 were as follows:

Countries	EXPORTS

The figures for the year 1919 were not available but during the first seven months the total foreign trade came to 2,050,762,000 milreis (milreis paper=about \$0.275, U. S.), the exports amounting to 1,289,390,000 milreis, and the imports to 761,372,000 milreis. As to quantity, the exports showed a total of 1,140,575 tons, and the imports, 1,708,103 tons. Both in volume and in value, the trade was much larger than in the same period of 1918.

RAILWAYS. The railroads in Brazil are divided into three groups: Those belonging to the Brazilian government, comprising 15,251 kilometers; those owned by private companies, with a trackage of 10,051 kilometers; and the railways of the state governments, which are 2464 kilometers in length. In the first group there are 6420 kilometers under the management of the government, and 8850 kilometers under management of leaseholding companies. Wishing to develop the railroad industry in Brazil, the government not only constructed or bought the railroads it owns to-day but assisted several companies by guaranteeing the interest on the capital invested in the construction of the lines. During 1918 the government paid nearly \$4,500,000 as guaranty of interest. The Sao Paulo-Rio Grande received \$2,671,286; the Victoria-Minas received \$1,082,269; the government's lines of the Sorocabana, \$321,263. The small line with 68 kilometers in traffic on the bank of the Tocantins River, \$148,399; the lines subsidized of the Leopoldina, \$174,340; and in Minas Geraes the Jaguará-Araguary line of the Mogyana system received \$133,105. The above information was supplied by the United States Bureau of Foreign and Domestic Commerce, but according to figures given out as official during the year the total railway length was 30,101 kilometers, distributed by states as follows: Sao Paulo, 6706; Minas Geraes, 6527; Rio de Janeiro, 3131; Rio Grande do Sul, 2756; Pernambuco, 2098; Bahia, 1839; Matto Grosso, 1168; Parana, 1064; Santa Catharina, 1018; Ceara, 891; Espiritu Santo, 652; Para, 450; Parahyba, 368; Alagoas, 364; Rio Grande do Norte, 313; Sergipe, 292; Federal District, 187; Govaz, 179; Maranhao, 91, and Amazonas, 6.

It was reported in 1919 that work was to be resumed on the extension of the Estrada de Ferro de Nazareth, as the legislature of the State of Bahia had established a credit for the carrying on of the work. This line had in operation 221 km. (137 miles); 30 km. (19 miles) in course of construction, and 35 km. (22 miles) surveyed. Work on this extension had been suspended since June, 1918, because of the failure of the State to provide funds for construction.

The effects of the World War were felt by the railways of Brazil both in difficulties and expense of maintenance and the inability to secure capital for necessary developments. It was realized in 1919 that there was much to be done for Brazilian railways and the raising of the tariffs was urged, though a 20 per cent increase had been made on the Central Railway belonging to the government and a similar increase authorized for the Sul de Minas system and for the F. de l'Est Brésilien. The reports for 1918 of three principal companies, the Sao Paulo Railway, the Leopoldina Railway and the Great Western of Brazil, show the following comparisons between the five years ended 1918 and the five years ended 1913:

		1909-1913 (INC.)			
		Average length of line	Average gross receipts	Average working expenses	Average P.C. net of receipts exp
Sao Paulo	153	£2,066,989	£1,268,218	£798,776	61
Leopoldina	1,631	1,492,104	925,751	506,353	66
Gt. Western	953	644,282	427,868	216,414	66

		1914-1918 (INC.)			
		Average length of line	Average gross receipts	Average working expenses	Average P.C. net of receipts exp
Sao Paulo	153	1,610,217	1,108,592	501,625	69
Leopoldina	1,820	1,526,543	1,062,045	464,498	70
Gt. Western	1,010	658,796	485,056	178,740	73

FINANCE. Revenues for 1918 were as follows: 66,437 contos (conto=1000 milreis), gold, and 380,995 contos, paper, as follows: Import duties, 55,219 contos, gold, and 52,567 contos, paper; tax on consumption, 116,007 contos, paper; stamp tax, etc., seven contos, gold, and 43,746 contos paper; tax on incomes, 94 contos, gold, and 14,901 contos, paper; tax on inheritance 598 contos, paper; tax on industrial revenues, 486 gold, and 96,109 contos, paper; extra revenues, 221, gold, and 38,933 contos, paper; special revenues, 10,407 contos, gold, and 14,766 contos, paper; lottery, 1067 contos, paper, and other revenues, three contos, gold, and 2301 contos, paper. The following table taken from the *Statesman's Year Book* shows the budget estimates for 1919:

	Gold milreis	Paper milreis
Revenue		
Import duties, etc.	82,072,400	66,564,000
Consumption taxes		131,180,000
Circulation taxes	20,000	28,300,000
Tax on incomes		6,610,000
Tax on lotteries		1,400,000
Other revenue		6,260,000
National patrimony and industries	1,800,000	104,492,000
Extraordinary revenue ...	24,141,034	119,650,000
Resources	100,000	150,000
	108,133,434	474,606,000
Less 5% set aside for special application	7,488,000
Total general revenue ..	100,645,434	474,606,000
Revenue with special application	12,888,000	28,383,000
Total revenue	113,533,434	502,989,000
Expenditure		
Ministry of Justice and Internal Affairs	18,342	47,691,803
Ministry of Foreign Affairs	3,220,146	1,207,800
Ministry of Marine	200,000	49,478,213
Ministry of War	100,000	77,947,308
Ministry of Agriculture	606,680	17,545,368
Ministry of Transportation and Public Works	27,397,492	158,114,071
Ministry of Finance	48,827,167	124,656,631
Total expenditure	80,369,827	476,641,194

The budget estimates for 1920 fixed the nation's expenditures for the year at 80,953,000 milreis gold (gold milreis about \$0.546 U. S. gold) and 526,953,000 milreis paper (paper milreis=about \$0.275 U. S.), representing a decrease of 5,218,000 milreis gold and an increase of 61,555,000 milreis paper compared with the sums appropriated for the expenditures of the present year. The following official figures on the financial situation of Brazil were supplied by the *Pan-American Union*: Foreign indebtedness, £116,434,274 sterling; internal debt, 1,012,137,000 milreis; currency in circulation, 1,709,113,473 milreis; conversion fund, 20,922,410 milreis, gold; guarantee fund, 48,391,020 milreis,

gold; unredeemed bills and notes, gold and paper, 14,632,500 milreis. The general taxes of the country for 1918 were 103,519,715 milreis, gold, and 380,995,807 milreis, paper, as against 67,155,954 milreis, gold, and 341,070,891 milreis, paper, in 1917; 62,872,969, gold, and 316,187,516, paper, in 1916; 48,931,835, gold, and 313,159,829, paper, in 1915; 75,767,717, gold, and 268,992,658, paper, in 1914. The amounts added give the total of 358,248,190 milreis, gold, and 1,620,406,701 milreis, paper, as the national tax for the five-year period of 1914-1918 both inclusive. The public wealth of Brazil is calculated to be 30,000,000 contos, reckoned as follows: Unimproved property, 10,000,000 contos; improved property, 5,500,000 contos; personal property, 7,000,000; live-stock, 5,000,000 contos; railroads and ports, 2,000,000 contos; manufacturing industries, 500,000 contos.

GOVERNMENT. The executive authority is vested in a president who is elected for four years and is not eligible for a succeeding term. The legislative authority is vested in the National Congress consisting of the Chamber of Deputies and the Senate. The former has 212 members elected for three years by direct vote and the latter 63 members elected for nine years, of whom one-third are renewable every three years. President, Dr. Epitacio de Silva Pessoa, elected April 13, 1919, for the remainder of the period 1918-1922. At the time of his election he had been chief of the Brazilian delegation at the Peace Conference. He visited the United States in 1919. In January, 1919, it was learned that the Congress of Brazil had authorized the continuance during 1919 of the preferential treatment of certain American products. BREEDING, PLANT. See BOTANY.

BRETHREN, CHURCH OF THE. This denomination, commonly known as "Dunkers," was organized at Schwarzenau, Germany, in 1708. It comprises a membership of about 100,000, with more than 1000 churches and 3300 ministers. It has established missions in India, China, Denmark, and Sweden, and is making active efforts towards the establishment of a church in Africa. Its missionary force on the foreign fields numbers 116, of whom 32 were appointed during 1919. The work of Home Missions is cared for through the medium of 47 State Districts in this country, each of which has a District Mission Board. Missionary contributions for the church for 1919 were \$277,417.91, while more than \$200,000 was raised for war relief work, its efforts being centred primarily in Armenia. The church is engaged in a Five Year Forward Movement programme which aims at very great expansion of its work during the next five years. Ten colleges are maintained, having in 1918 a total enrollment of 2434. Sunday Schools numbered 1271 with a total enrollment of 123,466 pupils and 12,459 officers and teachers. The headquarters of the various church boards are in Elgin, Ill., including the General Mission Board, General Educational Board, General Sunday School Board, General Christian Workers' Board, Temperance Board, General Relief Committee, and the Peace Committee. The publishing house is at Elgin, Ill., and the organ of the church is known as the *Gospel Messenger*.

BRIDGES. Bridge construction during 1919 in Europe involved principally the restoration of structures that had been destroyed during the war and the providing of temporary or permanent structures that would enable ordinary transportation and commerce to be resumed. In the United States the railway situation was such that no major improvements of any kind could be undertaken without their absolute necessity being more than demonstrated, and naturally in this class bridge construction fell. Therefore in 1919 there were no such structures as have been described in earlier YEAR BOOKS, such as those at Quebec, Hell Gate, Memphis, Metropolis, Sciotoville, New London and Louisville. The most important structure on which work was in progress was at the Baltimore and Ohio bridge at Pittsburgh. While there were discussions of proposed projects, several of which are outlined later in this article, the necessity for economy was also reflected in municipal and state operations so that there was but little activity in large highway bridges. In fact in many cases tunnel construction as an alternative often was favorably considered.

ECONOMIC SPAN LENGTHS FOR BRIDGES. An important paper on Economic Span Lengths for Simple Truss Bridges was presented before the Western Society of Engineers, Chicago, on Sept. 15, 1919, by Dr. J. A. L. Waddell, of Kansas City, Mo. In preparing this paper the actual cost of both substructure and superstructure for over 200 cases of bridge layouts covering the following combination was computed. Railway, highway, and combined railway and highway bridges, on concrete pier shafts overlying caissons or cribs raised on sand, bed-rock or piles reaching to depths below low water of 50, 100, 150, and 250 feet; also for low, medium and high conditions of the material market. As a result of the study and the incidental tabulation of results, Dr. Waddell drew the following deductions: That for all types of bridge the economic span length increases with the depth of foundation, though not necessarily in the same proportion. The lighter the superstructure and the live load carried the greater generally is the economic span length, and the greater the variation of the latter with the depth of foundation. For sand foundations there is not much difference in economic span length for low level and high level bridges of the same type. Structures with piers founded on bed-rock generally have economic span lengths somewhat greater than those of corresponding structures founded upon sand. Single track railroad bridges have economic span lengths a little less than those of the corresponding double track structures. Pile piers for high level bridges involve, for economic considerations, rather short spans, and for low level structures they usually necessitate such short ones as to require the adoption of plate girder superstructures. In highway bridges having very deep foundations on sand, increasing the batter of the shaft augments the economic span length. The use of nickel steel instead of carbon steel in the superstructure increases materially the economic span length. Dr. Waddell was also about to provide a check on the accuracy of the old methods of determining economic span lengths, and he found that the former rule for determining these amounts was not reliable, especially for foundations of

great depth, hence should not be used. This paper was printed in the *Railway Age* for Sept. 26, 1919, vol. 67, No. 13.

REVISED BRIDGE SPECIFICATIONS. A committee of the American Railway Engineering Association entered, at a meeting of that body in March, 1919, a proposed draft of the revision of the steel bridge specifications which had figured for many years in American Railway Engineering. These were originally drawn up in 1904, adopted in 1906, and slightly revised in 1910, since which time there have been changes in conditions due to increased weight of rolling stock and the use of special steels and other materials. The Association declined to accept the revision as drafted and referred it back to the committee for reconsideration, but it was not believed that a re-draft would depart very much from the general lines of the first draft. The specifications under discussion were limited to spans not exceeding 300 feet, as it was believed that beyond such dimensions a railway bridge presented special problems which could not be solved in general specifications. The submission of these specifications naturally aroused discussion as to the various bridge specifications in use on the leading railways, and it was found that not only was there a substantial difference in the proposed specifications of the American Railway Engineering Association over the old, but also there was a difference between those in use on the Southern Pacific prepared in 1909, on the Pennsylvania prepared in 1916, and on the New York Central prepared in 1917. These specifications were summarized and their outstanding features compared in *Engineering News Record* for July 3, 1919.

MILITARY BRIDGE ENGINEERING. One of the important engineering developments of the Great War in Europe was the development of military bridges adequate to the loads which modern military service required. This rendered obsolete many of the types used in the United States as well as in foreign armies, and a distinct tendency of the time was the use of civilian bridge engineering methods and the virtual abandonment of the systems of the military engineer as regards fixed bridges. In the Corps of Engineers of the American army, a bridge department was organized beginning with two engineer officers, which soon developed into an important force and was called upon in many operations. The bridge equipment even for pontoon bridging was most inadequate and required development as well as the fixed bridge material.

Showing the importance of bridge construction. Major Lewis E. Moore and Captain Marshall W. McDonald, in a paper in the *Engineering News-Record* for Oct. 9, 1919, vol. 83, No. 15, page 690, state that over the Meuse River between Verdun and St. Mihiel, approximately 33 km., the French constructed 23 crossings for wheeled traffic and 47 crossings for infantry. Between March and December, 1918, inclusive, the British army erected 562 highway bridges. The American First army built nearly a mile of bridges during the Meuse-Argonne offensive and immediately afterward, as the following table indicates. The table includes railway bridges, though the present article is confined to the subject of highway bridges:

LINEAL FEET OF BRIDGING							
	Number of Bridges	Strength- ened	Wid- ened	New Framed Trestle	New A- Frame	New Pile Frame	New on Piles
Highway ...	40	1329	95	662	400	120	90
Stand-gauge.	12	230	.	305	186
60 cm gauge	12	330	.	276	195
Totals ..	64	1889	95	1243	781	120	90

The paper from which this is quoted and the succeeding article in the same journal, Oct. 16, 1919, page 734, contain a copiously illustrated summary of military bridge construction by the American Expeditionary Force.

PONTOON BRIDGES OF THE U. S. ARMY. The American Engineer Corps in Europe with the Army of Occupation carried on some pontoon bridge construction with remarkable speed and efficiency. The Third Corps Engineers maintained a Pontoon Bridge School at Hönningen on the Rhine, where the river is 1440 feet wide and has a current of nearly 7 km per hour. The river is approximately 25 feet deep in midchannel and has a rock bottom, so that bridge construction is rendered difficult, and a pontoon bridge is the most feasible from the military standpoint. On May 25th the 2d Engineers, using captured German pontoon equipment, consisting of 91 steel boats and three trestles, making 95 spans in all, and working from both banks, constructed the bridge in 58½ minutes, and immediately after its completion it was crossed by a field battery with full equipment. The bridge detail consisted of 400 men, half of whom had received 10 days' training and the other half but three days. The record made by this company did not stand long, for on June 8th the 1st U S. Engineers did the same work in 41 minutes 8½ seconds, at the end of which time they had the bridge in readiness for crossing and of sufficient capacity to accommodate the entire divisional traffic.

DETROIT RIVER BRIDGE. One of the interesting proposals of the year on which investigations were started was a bridge across the Detroit River to connect Detroit and Windsor, Canada. Gustave Lindenthal, engineer of the Hell Gate arch bridge, was appointed consulting engineer, and Charles E. Fowler chief engineer for the joint boards of American and Canadian companies which were to undertake the construction. The views most favored in 1919 were a double deck structure to carry roadway traffic, street cars and steam trains, and it was believed that either a cantilever or a suspension bridge of from 1800 to 2400 feet span would be adopted. A bridge of this size would rank among the greatest bridge structures of the world, and the estimated cost would be between \$20,000,000 and \$30,000,000. It was of course essential not to obstruct the heavy vessel traffic on the Lakes in any way, but it was eminently desirable to provide for the increase of traffic between Detroit and Windsor, which had become an important industrial centre in recent years.

On Dec. 2, 1919, a bill authorizing the city of Detroit to construct and operate a bridge across the American channel of the Detroit River to Belle Isle passed the United States Senate. This bridge was estimated to cost about \$3,000,000, and the original plan called for a bridge without a draw span, closing the American channel. Approval of this project was granted by

the local United States Engineer office, but was denied at Washington, a draw span being required, regardless of the height of the bridge. In order to carry out the design of the bridge with a solid span which shall close the American channel to vessels larger than pleasure craft and scows, further Congressional action was to be required. During the year the designs were being prepared for the approaches of the bridge, and a subway under Jefferson Avenue to separate traffic where the boulevard crosses Jefferson Avenue near the north approach to the bridge was an important feature. This subway was to have a roadway approximately 36 feet wide and a grade of about $3\frac{1}{2}$ per cent. It was planned to proceed with the bridge work, inasmuch as it would relieve congestion at the approach of the temporary bridge in use, while action was being taken with regard to the main span of the bridge.

CHICAGO RIVER BASCULE BRIDGE. During the year the longest single leaf bascule bridge ever built was completed over the Chicago River. This bridge was on the St. Charles Air Line, one of the first lines of railroad built in Chicago, which is a short east and west transfer line extending from the Illinois Central on the lake front in the vicinity of 16th Street to a point west of the Chicago River, being considerably less than a mile in length, but connecting the Illinois Central and the Michigan Central at the eastern end with the New York Central, the Chicago, Rock Island and Pacific, the Chicago, Burlington & Quincy, and the Chicago & Northwestern, being owned jointly by a number of lines and operated by the Illinois Central. The new record structure was built to replace a swing span constructed in 1882, 297 feet 6 inches long, and crossing the river at an angle of 42 deg. 45 min., providing two channels, one of 59 feet and one of 55 feet. For the new bridge the alignment and track arrangements were changed, making a shorter bridge, namely, of 260 feet length between the end bearings of the moving leaf, and affording a clear channel for navigation 200 feet wide. This bridge crosses the river at an angle of 63 deg. 28 min. The old bridge was used during construction. The substructure presented several unusual features. Although the east piers and the southwest piers of the west structure could be constructed by the "Chicago" method of open well excavation, the northwest pier on the west side required a puddle coffer dam, as it was close to a private slip. For the two east piers a cellular crib was developed on account of lack of sufficient earth cover over the rock, and a puddle wall was provided surrounding two interior cells on the sites of the two piers. This puddle wall enabled the level of the water to be reduced, and here sheet piling was driven in circles approximately the size of the piers. The space within these circles was then excavated to a depth of about two or three feet into the rock and filled with concrete, and this concrete structure was gradually brought up, the wooden cribs remaining as a protection to the structure. The bridge was erected in a vertical or open position, with the outer end some 265 feet above the track level, or about as high as a 22-story building, thus presenting difficulties in construction. The tower, and counterweight trusses were first erected, while the moving leaf was erected by means of a tall

derrick more in the fashion of a tall steel frame building than a steel bridge. The span in its vertical position served as an enormous elevator shaft, in which the erection equipment might be considered the elevator, as the derrick moved upward as the structure was developed.

The Strauss Bascule Bridge Company of Chicago were the consulting engineers, the Foundation Company of New York built the substructure, work on which was begun in October, 1917, and completed in August, 1918. The superstructure was begun in October, 1918, and completed in August, 1919. The structural steel weighs 1544 tons, and the trunnion pins and operating machinery 166 tons. The main trunnions are 25 inches in diameter, the counterweight trunnions 46 inches, and the first and second link pins 20½ inches and 31 inches respectively. This bridge is discussed with diagrams in the *Railway Age* for Dec. 12, 1919.

REBUILDING THE NIAGARA GORGE ARCH. The 550-foot steel arch double track railway bridge crossing the Niagara Gorge, Niagara Falls, N. Y., underwent reinforcement during the year, so that its capacity is adequate to meet the heaviest traffic and the increasing demands. This was carried out successfully by October 1, and involved a stress readjustment after a series of strain gauge measurements of primary stresses, secondaries and impact. The net result was that a bridge built 22 years previously was so strengthened as to meet modern conditions. Not only were bad and loose rivets found and removed, but the few parts, notably the railway floor members, which had deteriorated due to salt water drip from the trains were replaced or strengthened; these being the only evidences of deterioration of the Arch. As a result of the reinforcement the main arch was found amply strong for the heavier loads.

KANKAKEE BRIDGE OF ILLINOIS CENTRAL R. R. An interesting project completed during the year was a wide bridge for the Illinois Central Railroad at Kankakee, Ill., built as two bridges without interval by the use of the same equipment twice and two separate set-ups of the same centres. This was a 4-track, 6-arch railway bridge, with five 90-foot and one 60-foot barrel arch spans, with spandrel walls and a deck of precast slabs. It is 64 feet wide, face to face at arch rings, and including the piers the structure required about 16,000 cubic yards of concrete. It took the place of a single-track, three span steel truss bridge, and construction of the new bridge was undertaken without interfering with the old. After the first half of the bridge was completed, tracks were shifted from the steel bridge to it, the older structure was removed, and the remainder of the new bridge was then built.

MISSOURI RIVER BRIDGE AT CHAMBERLAIN, S. D. The Chicago, Milwaukee & St. Paul Railway during the year completed a bridge across the Missouri River at Chamberlain, S. D., which showed the influence of the wartime conditions in the extraordinary use of pile piers to support 300 foot steel truss spans and a combination of reinforced concrete and timber that was distinctly novel. This particular structure took the place of a pile trestle, with a pontoon barge 366 feet long to meet government requirements for a draw opening for the river traffic, and two 300-foot single track through truss spans

released from a bridge over the Kaw River were purchased in 1917 from the Kansas City Terminal to be substituted for the original bridge. In 1918 the pontoon developed leaks, requiring its withdrawal from service, and after a temporary swing span was used, it was decided to construct a permanent bridge. For the substructure the construction determined on consisted of a combination of a piled pier supporting the superstructure, with a rock-filled ice break timber cribbing protected against scour by the high velocity of the current in flood season by willow mattresses and rip rap. The vertical load of the pier is carried by 70-foot piles capped by a grillage of cross timbers. In addition to the pile driving a certain amount of concrete was employed, including concrete covering to the nose of the ice breaker and a horizontal diaphragm or slab of concrete covering the entire area of the pier to receive the thrust of the ice pressure and transmit it uniformly to all the piles in the pier. With the piling and through the two trusses referred to, a 262-foot pontoon to replace the original one was constructed, and this was launched on Mar. 1, 1919.

RONDOUT CREEK BRIDGE DESIGN CONDEMNED. During the year the substructure work on the highway bridge over Rondout Creek at Kingston, N. Y., was stopped by order of the State Highway Commissioner, Frederick Stuart Greene, on the ground that the proposed foundation for the main pier was unsafe. Furthermore, it was plain that the superstructure could not be built for the available money, and as the design in his opinion was unsuited to the location, he withdrew the specifications for the superstructure from bidding April 22, two days before the bids were to be opened. The preparation of new designs was under progress later in the year, as the bridge is required as part of the new State highway from Kingston to Port Ewen, a link in the New York to Albany highway along the west bank of the Hudson River. The plans that were held up were made with regard to the War Department requirements, which fixed a clearance height of 85 feet on a width of 200 feet above Rondout Creek. The design condemned consisted of two steel arch spans of 360 feet with a rise of 110 feet, with a centre pier raised on a pile foundation, the piles going 60 feet below water. On either bank were two piers, which were solid up to the springing line of the arches. The centre foundation piles were driven inclined on a 1:5 batter alternately a pile row in one direction and a row in the other, with a view of securing stability against any unbalanced thrust developed by the two arches. On either side were two rows of vertical piles, 52 in number, but the batter piles were 338. The bearing pile cluster was enclosed by a wall of concrete sheet piles intended to serve as a coffer dam during construction, and subsequently as a bearing element for the outer part of the capping slab. The foundation was designed to carry a gross load—dead load plus live load—of something over 9000 tons, which in Commissioner Greene's opinion was too high for the piles. It was stated by Commissioner Greene that the State of New York had suffered a financial loss of \$47,916.40, of which \$37,500.97 represented payments to contractors. The criticism of Commissioner Greene on the design and work done on the

foundation was replied to by H. Eltinge Breed, Deputy Commissioner of Highways under the previous administration, and W. R. Davis, who was the author of the original design, who argued that the bridge was safe and that the design was proper and could be constructed for the available funds. In place of the original design, Highway Commissioner Greene directed Daniel E. Moran, a civil engineer who had specialized in foundations, to prepare new designs, and a massive concrete viaduct with concrete arch spanning the canal was planned.

MEMORIAL BRIDGES. As war memorials monumental bridges were under consideration in many American cities as ornamental architectural features readily could be introduced to carry out the underlying idea. One of the largest of these memorial bridges, the State Soldiers and Sailors' Memorial Bridge across the Susquehanna at Harrisburg, Pa., was contracted for during the year at a cost of \$2,384,458. This bridge was to be put under way before the end of the year.

LIFTABLE SPANS AT PITTSBURGH. A proposition was made during the year that the new Allegheny River bridges at Pittsburgh, which were being designed to meet the War Department's requirements as to span length and navigation clearance, be equipped with liftable spans instead of fixed spans, in order to accommodate them to the clearance requirements at all river stages. The height dictated by the maximum stage of water naturally conditioned the building of fixed spans, and this involved steep approach grades. With the liftable span system, the steep grades would only be required at high flood stages.

That replacement of engineering structures after years of service is required was shown by the fact that the renewal of two old bridges over the Willamette River was under consideration by the Multnomah County, Oregon, commissioners. These were the Burnside and Morrison bridges, whose condition was thought to be becoming dangerous. A cost of \$2,000,000 was like to be involved in the replacement of these important structures.

Among new construction in the south is the St Johns River bridge at Jacksonville, Fla., on which work started on September 25th. The foundations involved an outlay of \$374,447, this sum covering also the approaches. The superstructure to be built by the Bethlehem Steel Bridge Corporation, Bethlehem, Pa., was to cost \$534,180.

BRIGHT'S DISEASE. This affection was originally looked upon as medical almost exclusively, something to be studied, recognized and treated by the physician. Surgical kidney so-called was relatively a narrow subject. Gradually the surgeon has encroached on the original domain of the physician in pathological study, diagnosis and treatment, until the ratio of medical to surgical cases has become markedly altered. Generally speaking, when both organs are simultaneously attacked by a process that involves a pathological blood state and in which surgical measures are unavailing, the condition is classed as medical. Quite recently, however, William J. Mayo, the distinguished surgeon, has written a paper on what would ordinarily be called medical nephritis; and this fact is significant. The term Bright's disease he restricts to disease affecting both organs and due

to some blood or general state. He isolates acute and chronic forms which have nothing in common. The acute form occurs in the midst of or following some one of the infections which attack the skin or mucous membranes, as scarlatina and diphtheria. The organs are large, white and soft, and oedema, while not always present, is very common and due to retention in the blood of the chlorides, as shown by the fact that a salt poor diet will dispel the dropsical swelling. The urine is scanty and loaded with albumin. This typically acute form may occur at times in a subacute and even a chronic form, but must not be confounded with the typical chronic Bright's disease to be discussed later. The patient often recovers from the acute type of the disease. The second great form of medical nephritis differs radically from the first, begins insidiously, cannot be brought in direct relation with organisms in the blood but is often associated with cardiovascular disease, and high blood pressure and is technically incurable, although patients may live 20 and even 30 years with it. The urine is not diminished and is often increased in amount and bropy and albuminuria are mostly absent. The foregoing is merely a résumé of what is common knowledge, but Mayo now calls attention to a third type of disease due to an organism in the blood, which does not involve the kidneys equally and may be limited to one organ. It may pass for Bright's disease but is not entitled to this designation. A kidney which is inferior because of some congenital defect is often attacked. The infecting germ may vary not only in kind but in virulence. Thus we have hyperacute or fulminating cases which if both kidneys are involved quickly destroy the patient; while if one organ is attacked and destroyed its surgical removal may save the patient's life. If the infection is less intense more or less local mischief requiring surgical aid may develop in or around the organs. The organisms do not long survive in the blood, so that attempts to isolate them may fail. The local abscesses may produce scar tissue and deformity in the kidneys, which at a later period may demand further intervention. Deposits of lime salts in these kidneys are often confused with renal calculi in X-ray diagnosis. The author concludes with the statement that the general interest of the surgeon in the kidney now at least equals that of the physician, while the fact that he is always operating gives him a considerable advantage in actual knowledge of diseased kidneys. The physician has been and still is at a disadvantage because as a rule he must depend on autopsy finds for this information. The two fundamental forms of medical nephritis may be accidentally associated in the same kidney and neither form may be associated with the third form, and these mixed cases are naturally the most difficult of recognition and treatment.

BRITISH COLUMBIA. A maritime province of Canada on the Pacific Ocean extending from Alberta to Alaska with an area of 355,855 square miles inclusive of inland waters, and a population according to the census of 1911 of 392,480, estimated in 1917 at 396,800. The chief cities with their estimated population in 1918 were: Victoria, the capital, 45,000; Vancouver, 99,000; New Westminster, 15,000; Nanaimo, 8000; Nelson, 7000. The executive

power is vested in the Lieutenant-Governor, appointed by the Governor-General of the Dominion, who acts through a responsible ministry or executive council, consisting of eight members. The legislative power is in the legislative assembly of 47 members elected for four years by direct male and female adult suffrage. Lieutenant-Governor at the beginning of 1919, Sir Frank S. Barnard; Prime Minister, John Oliver. See CANADA.

BRITISH EAST AFRICA. The area on the mainland of Africa comprising East Africa Protectorate, Uganda Protectorate and Zanzibar Protectorate. See these articles.

BRITISH GUIANA. A South American British colony on the northeastern coast including the settlements of Demerara, Essequibo, and Berbice; bounded on the east by Dutch Guiana, on the south by Brazil, and on the west by Venezuela, and on the northeast by the Atlantic Ocean. Area, 89,480 square miles; population (1911) 296,000; estimated, Jan. 1, 1918, 314,000. According to the estimates of 1917, 62,400 were living on the sugar estates and 125,800 in villages and settlements. The East Indians on that date were placed at 75,740. Out of the total population 105,400 were agricultural laborers. Of the surface only 198,352 acres were under cultivation in 1918, the leading crops in point of acreage being rice, sugar cane and coconuts. The chief domestic exports are sugar, rum and rice.

	1914	1917
Imports	£1,766,094	£3,271,017
Exports	2,623,064	4,315,939
Revenue	586,598	736,478
Expenditure	622,025	783,689
Shipping *	682,906

* Tonnage entered and cleared.

Exports in 1918, \$16,919,029; imports, \$16,292,508.

The United States continued the increase in imports of 1917, the gain in 1918 being \$1,342,483, or 22 per cent. The United States supplied 44.5 per cent of the total imports, the United Kingdom 25.7 per cent, Canada 16 per cent, and other British possessions 10.8. The export trade, however, was largely with the United Kingdom and Canada, the United States taking only 5.7 per cent of the total exports as compared with 46.2 per cent by the United Kingdom, 33.3 per cent by Canada, and 6.6 per cent by other British possessions. The total trade of the colony was divided as follows: The United Kingdom 36 per cent, Canada 24 per cent, the United States 24 per cent, other British possessions 6 per cent, and all other countries 10 per cent.

BRITISH GUINEA. See PAPUA.

BRITISH HONDURAS. A British crown colony on the coast of Central America south of Yucatan and 660 miles west of Jamaica. Area, 8598 square miles; population (1911) 40,458; estimated, Jan. 1, 1918, 42,732. Only a small part of the land is under cultivation. The main sources of wealth are mahogany and other forest products. The chief imports of 1917 were gum, flour, boots and shoes and the chief exports were mahogany, bananas, coconuts, gum, and logwood. Statistics for two years follow:

	1916-17	1917-18
Imports	\$553,765	\$574,850
Exports	259,641	530,300
Revenue	131,782
Expenditure	126,294
Shipping *	863,916	686,987

* Tonnage entered and cleared.

BRITISH INDIA. See INDIA, BRITISH.

BRITISH NEW GUINEA. See PAPUA.

BRITISH NORTH BORNEO. A British colony occupying the northern part of the island of Borneo, under the jurisdiction of the British North Borneo Company and administered by a governor in Borneo and a court of directors in London. The British government proclaimed a formal protectorate over the State of North Borneo on May 12, 1888, and certain additional lands were acquired in 1898 and later. The area is about 31,106 square miles; population (1911) 208,183 chiefly made up of Mohammedan settlers on the coast, and native tribes in the interior. In 1911 the Europeans numbered only 353. The number of natives has only been roughly estimated and is placed at about 170,000, the most numerous being the Dusuns. In 1911 the most numerous foreign element residing in the territory was the Chinese, who numbered about 26,000. The trade is with Great Britain and the colonies chiefly through the ports of Singapore and Hong Kong. The chief products are coconuts, gums, coffee, and a variety of table fruits, vegetables, spices and tobacco. A railway 127 miles long connects Jesselton on the coast with Melalap in the interior. Statistics for 1916 and 1917 are as follows:

	1916	1917
Revenue	\$249,587	\$280,480
Expenditure	170,045	170,685
Imports	500,933	624,487
Exports	1,014,142	1,076,073

BRITISH SOMALILAND. See SOMALILAND PROTECTORATE.

BRITISH SOUTH AFRICA. See SOUTH AFRICA, UNION OF.

BRITISH WEST AFRICA. A term including the British colonies and protectorates in West Africa namely Nigeria (colony and protectorate), Gold Coast (comprising the Gold Coast Colony, Ashanti, and the Northern Territories), Sierra Leone (colony and protectorate), Gambia (colony and protectorate). See these separate titles.

BROOKLYN INSTITUTE OF ARTS AND SCIENCES. Founded in 1824 and reincorporated in 1890, this institute consists of four departments, namely, the Department of Education, headed by Charles D. Atkins; the Department of Museums, including the Brooklyn Museum and the Children's Museum, headed by William H. Fox; the Department of Botanic Gardens, headed by C. Stuart Gager, and the Department of Biological Laboratory, headed by Charles B. Davenport. Addresses, lectures, courses of instruction, concerts, and meetings are offered by the educational department. Each year many important men lecture, and eminent artists give concerts. Only very small fees are charged for these opportunities. The School of Pedagogy is one of the well-known features of this institute. The art, ethnology, and natural

science departments of the Brooklyn Museum are among the finest in the country. The Brooklyn Botanic Garden ranks among the leading botanic gardens of the country. The total membership in all departments at the close of 1919 was 9905. The total attendance for the season 1918-1919 was 1,064,425. The total receipts for the same year were \$424,824.58, and the permanent funds were \$1,041,142.26. There are branches of the Institute at Jamaica and Huntington, Long Island. The President of the Board of Trustees was A. Augustus Healy.

BROWN, DANIEL RUSSELL. Former governor of Rhode Island, died at Providence, R. I., February 28. He was born at Bolton, Conn., Mar. 28, 1848, and founded the firm of Butler, Brown & Company in Providence, which afterwards became the Brown Brothers Co. He was governor of Rhode Island from 1892-5.

BROWN UNIVERSITY. An institution of higher learning, located at Providence, R. I. The enrollment for the fall of 1919 was as follows: freshmen, 277; sophomores, 220; juniors, 174; seniors, 182; specials, 79; graduate students, 106; women's college, 270. The faculty contains 78 members, exclusive of assistants, etc. The library contains 270,000 volumes. During the year a new Language Building was erected, and also a Memorial Arch. In effect September, 1919, the entrance requirements were modified by reducing the language requirements and increasing the number of electives; a comprehensive psychological test is also required. The requirements for degrees of A.B., Ph.D. were also changed at this time. Brown University was founded in 1764. President, W. H. P. Faunce, D.D., LL.D.

BYRN MAWR COLLEGE. An institution for the education of women located at Bryn Mawr, Pa. Enrollment on Nov. 25, 1919 was 458, and there were 67 members in the faculty. Productive funds amounted to \$2,002,195, and the income for the year was \$93,989. The library contains 94,000 volumes. Bryn Mawr is one of the educational institutions to benefit under the will of the late Mrs. Russell Sage. A campaign is in progress for a \$2,000,000 Endowment Fund to increase the salaries of the teaching staff. During the absence on leave of President M. Carey Thomas, Miss Helen Herron Taft is acting president. The college was founded in 1880.

BUBONIC PLAGUE. While this affection has not recently threatened any serious invasion of countries outside its natural habitat, it has received a good deal of prominence from the close resemblance between the pneumonic form and the severest type of influenza. A comparison between the two may therefore be instructive. In its natural home in Asia the plague is primarily a disease of rodents, chiefly of the rat, and is conveyed from the latter to man through the bite of the rat-flea, which leads incidentally to the external swellings known as buboes, which are the most noticeable feature of the malady. Secondary pneumonia develops and when this is directly contagious from man to man we see the pneumonic form of the pestilence, which is diffusible without the intermediation of the flea. The two expressions of the disease usually flourish side by side, and exceptionally we see the pneumonic form alone, which has the highest mortality of any infectious disease, this being at times 100

per cent. In order to compare the bubonic plague in its double form with influenza we may take the experience of the city of Dakar in Senegal. In September, 1918, influenza appeared there in virulent form and its nature was not at first recognized. Patients suffering with the disease introduced it into Rio Janeiro through the regular steamship travel between the two seaports and the disease spread later throughout South America. During 1914-15 the same city had a visitation of the bubonic plague which did not first appear in the local rats but in man, in the pneumonic form. The contagion was traced to some small plague focus in Africa and vigorous measures of all kinds were used to combat it. While influenza attacked all parts of the city and all strata of society the plague was limited to certain quarters, streets and houses and spared inhabitants of European origin. And while the wave of influenza ran its course quickly according to its wont the plague persisted for about eight months, gradually dying out. After the first two months or so of the epidemic the rats were attacked for the first time and bubonic began to be reported side by side with pneumonic cases. The preventive measures found useful for the plague would have been helpless against influenza.

BUCKWHEAT. The area devoted to buckwheat in the United States in 1919 as estimated by the Department of Agriculture was 790,000 acres, while in 1918 it was 1,027,000 acres and for the years 1913 to 1917 inclusive 824,000 acres. The sudden and marked reduction in area was due largely to the end of the war. The increase in the culture of the crop had been the result of the greater use of buckwheat flour in the diet of the people of the United States to make larger quantities of wheat flour available for European requirements.

The total production was placed at 16,301,000 bushels as compared with 16,905,000 bushels in 1918 and 14,691,000 bushels for the five-year period of 1913-17. The very satisfactory average yield per acre, 20.6 bushels, as compared with 16.5 bushels the year before largely offset the reduced acreage. The average farm value of buckwheat on December 1st was estimated at 147.4 cents per bushel as against 166.5 cents and 100.7 cents, the corresponding bushel values in 1918 and for the five-year period respectively. On the basis of these prices the total value of the crop was \$24,026,000 in 1919, \$28,142,000 in 1918, and \$14,792,000 the average for the years 1913 to 1917, inclusive. The legal bushel weight of buckwheat in the different States ranges from 40 pounds in California to 56 pounds in Kentucky. The legal weight as established by Federal statute and by the laws of 15 States including most of the principal buckwheat producing States is 48 pounds per bushel.

A brief treatise on the culture and uses of this crop was published during the year by the United States Department of Agriculture as *Farmers' Bulletin No. 1062*.

BUEHLER, WILLIAM GEORGE. American naval officer, died at Philadelphia, Pa., August 10. He was born at Philadelphia, Mar. 25, 1837, and entered the navy in May, 1857, rising to the rank of chief engineer, Nov. 10, 1863. He was an officer of the United States steamship *Niagara* at the time when the first Atlantic telegraph

was laid. During the Civil War he was chief engineer on board the *Aroostook* 1861-2 and on board the *Galena* 1863-5 and he took part in the attacks on James River and at the entrance of Mobile Bay under Farragut. From 1894 to 1899 he was in charge of the department of steam engineering in the Portsmouth Navy Yard. He retired Mar. 25, 1899.

BUFFALO. See GARBAGE.

BUHLIG, RICHARD. See MUSIC, *Artists, Instrumentalists*.

BUILDING. Although difficulties in the way of securing materials and labor, together with their high cost, were evident in 1919, yet an estimate made at the close of the year placed the total of new building projects at an aggregate of \$2,600,000,000 including engineering construction. Of this amount one-third was stated to be residential, one-third industrial, 15 per cent for general business and 10 per cent for public works and utilities. There was available for building considerable capital, but uncertainty in regard to material costs, which together with labor were increasing, curtailed a certain amount of construction and in some localities as in previous years, continued to render speculative building impossible. Throughout the United States, and particularly in the large cities of the East and their suburbs, there was a considerable shortage of housing so that the building problem was indeed serious and related to general welfare. At the end of the year an estimate made of building operations in the great New York district gave \$550,000,000 as the total of the projects put under way, over one-third of which was residential. This was not so much the case in Manhattan where notwithstanding the shortage of homes, the greatest activity was in business projects as lack of space had brought rents to unprecedented figures. The Boroughs of Brooklyn and Queens experienced a great advance in home construction, especially in small houses in the suburbs which were occupied as soon as finished. The improvement of transportation facilities naturally influenced this demand but the shortage of accommodations in the city proper was a further impelling force.

Chicago experienced the third greatest building year in its history, 1919 being exceeded only by 1911 and 1916. In 1919 6523 building permits for all classes of structures were issued, representing \$102,906,150. As in New York this included a large number of small homes. In the Middle West generally there was considerable capital available for building and after the prosperity of the previous five years, an unprecedented amount of building was under way. An estimate based on reports of 11 months' activity in Illinois, Indiana, Iowa, Wisconsin, Michigan, Missouri, and Kansas, gives a total outlay for that time of \$820,506,000. In New England an outlay of \$207,288,000 for the year represented the demand for homes while in the middle eastern section many districts had records of nearly double those of the best previous years.

ZONE LAWS IN PHILADELPHIA. The tendency toward passing zone laws in the large cities of the United States was reflected in a movement in Philadelphia, where a proposed city ordinance was under active discussion during the year. This ordinance, drafted by the Philadelphia Zoning Commission, provided for five

classes of buildings as regards height, based on street width, these classes being 1, $1\frac{1}{2}$, 2, $2\frac{1}{2}$ and 3 times the street width respectively. In addition to this, in each district the buildings may not exceed a maximum height varying from 40 feet in the one-times district to 150 feet in the three times the street width district. Above such heights the buildings must recede from the building lines at a certain proportion, which is one foot for every foot of elevation in the one-time district, and one foot for every 3 feet excess height in the three-times district. As regards classes of buildings, four districts are provided, namely, residential, commercial, industrial, and unrestricted, the latter containing such industries as are obnoxious because of excessive noise, odor or smoke. Public garages are not permitted in the residential district, and the capacity of private garages is limited in proportion to the size of the lot. There are also classes of area districts in which the buildings are restricted to certain proportions of the lot, varying from the Class A district, where buildings may not cover over 30 per cent, to the "E" Class, where they may cover 90 per cent. The scheme has been worked out in considerable detail by a representative commission representing various interests of the city, and was under active discussion at the end of the year in Philadelphia.

ZONING ORDINANCE FOR NEWARK, N. J. A zoning ordinance providing for the regulation of building in Newark, N. J., specifying building heights and uses, and localizing types of construction, was before the Newark City Council during the year 1919. This was a further example of the tendency in large cities to attempt to control and symmetrically develop the city through intelligent restriction of building.

TO LIMIT HEIGHT OF BUILDINGS IN WASHINGTON, D. C. The House of Representatives passed a bill to regulate the height, area and use of buildings in the District of Columbia, one feature of which was the provision for a zoning commission, which was to consist of three commissioners in the District of Columbia, the officer in charge of public buildings and grounds in the District of Columbia, and the superintendent of the Capitol buildings and grounds. This bill was patterned after the New York and St. Louis zoning laws. See CITY PLANNING.

BUILDING OPERATIONS. See FINANCIAL REVIEW.

BUKOWINA. A crownland and titular dukedom of Austria, lying to the south of eastern Galicia, with Russia and east Rumania on the east and Rumania on the south. In the unsettled conditions following the disruption of the Austro-Hungarian monarchy in November, 1918, the exact statistics were not available. Its area and population when forming a part of the Austrian kingdom were according to the census of 1910: Area, 4033 square miles; population, 800,098; estimated population in 1913, 818,328. In the Austrian parliament it was formerly represented by 14 members, one for every 57,150 inhabitants. Capital, Czernowitz, with a population of 87,113 (1910)—estimated June 30, 1914, 94,000. For further details see preceding YEAR BOOK.

BULGARIA. A European monarchy situated in the Balkan peninsula, to the south of Rumania and to the east of Serbia. During the great war Bulgaria began by maintaining a

nominal neutrality but favored more and more the side of the Central Powers and finally on Oct. 12, 1915, declared war against Serbia. From that time she was definitely ranged against the Allies, and she was the first to suffer defeat. In October, 1918, she surrendered unconditionally to the Allies and the Czar Ferdinand was forced to abdicate, and was succeeded by his son Boris. See under *Government*, below; also *WAR OF THE NATIONS*.

AREA, POPULATION, ETC. The estimated area in 1917 was 47,750 square miles; estimated population 5,517,700. No figures are available later than those given in the preceding YEAR BOOK. The following table showing the area and population according to the census of Dec. 31, 1911, is taken from the *Statesman's Year Book*:

	Area sq. miles	Popula- tion
1 Bourgas	5,409	351,508
2 Varna	2,554	329,612
3. Vidin	8,255	237,571
4. Vratza	773	312,460
5 Kustendil	867	231,522
6 Plovdiv (Philippopolis)	3,238	447,809
7 Pleven	1,851	365,868
8 Rousse (Rustchuk)	2,135	406,309
9 Sofia	1,832	481,598
10. St Zagora	6,540	442,969
11. Turnovo	2,502	448,197
12. Choumen	2,691	282,601
Total (1910)	33,647	4,337,516
Total. (1912)	4,482,427

The religion is Greek Orthodox though the Bulgarian church was declared in 1870 to be outside the Orthodox communion. It is under the government of a synod of bishops. Education is subsidized annually by the State to the extent of one-half of the cost in general and two-thirds of the cost of elementary schools. The remaining costs are paid by the local authorities. Instruction is free and nominally compulsory between the ages of eight and 12. There is a university at Sofia with the four faculties of history; physics and mathematics; medicine, and law. Before the war the attendance at the elementary schools was 290,800 boys and 213,963 girls.

PRODUCTION, INDUSTRY, COMMERCE, ETC. The chief occupation is agriculture which engages about five-sevenths of the population, for the most part small proprietors of from one to six acres. The chief crops have been wheat, tobacco, barley, rye, oats and corn. Fruit also is raised in abundance. The State owns the minerals and the government works the coal mines of Pernik. Coal is also worked under concession in the region of Trevna in the Balkans. Stone is quarried in large quantities; iron is plentiful; gold, lead, silver, manganese and copper are found. The chief manufactures are woolen goods, cottons, cord, and cigarettes. Nearly 400 industrial institutions are reported to be in receipt of State aid. Commerce statistics before the war showed Austria-Hungary and Germany as by far the leading importers. Next on the list of importing countries was the United Kingdom. In the value of exports, while Austria-Hungary and Germany were in the lead, the United Kingdom and Belgium were not far below. The chief imports down to the beginning of the war were: metals, machinery, textiles, hides, leather, etc., cattle and cereals; and the chief exports were

wheat, corn, live-stock, silk cocoons, hides, attar of roses, etc. According to the Board of Trade returns imports to the United Kingdom fell from £195,143 in 1914 to only £800 in 1916. Exports from the United Kingdom fell from £857,856 in 1914 to £185,505 in 1915. In 1913 the vessels entered were 11,755 of 3,132,481 tons and cleared 11,710 of 3,108,505, the chief ports being Varna and Bourgas on the Black Sea and Rustchuk, Widin and Sistor on the Danube. Railway mileage in 1916 was placed at 1675 (State) and 149 (private companies); total 1,824. Telegraph lines in 1914, 3692 miles.

FINANCE. The budget estimates for the year 1918 are as follows: Revenue, 481,100,000 leva; expenditure, 479,414,019 leva. Consolidated debt, Dec. 1, 1917, 108,131,364 leva; floating debt, 2,324,200,215 leva. A lev (plural leva) is equivalent to a franc.

DEFENSE. Before the war the Bulgarian army consisted of nine field divisions in peace time and 14 in war. Its peace strength was about 3900 officers and 56,000 men; its war strength about 280,000. The Bulgarian troops were expelled during September, 1918, from the Serbian and Greek territories with a loss of over 30,000 prisoners and 400 guns. The armistice was granted on September 30th and demobilization immediately followed. On October 6th, 25,000 Bulgarians surrendered and on the 10th, 90,000 with more than 2000 guns. The casualties during the war were estimated at 200,000.

GOVERNMENT. The government is fixed by the constitution of 1879 as amended in May, 1893 and June, 1911. The executive power is in the king and a council of eight members nominated by him, and the legislative power is in a single chamber called the Sobranje, whose members are elected for four years by universal manhood suffrage. The king's consent is necessary to measures passed by the Sobranje. There is also a special body known as Grand Sobranje which is elected in the same manner as the regular assembly but contains double the number of representatives. It is called together to consider questions involving changes of territory or in the dynasty. Boris III succeeded on the abdication of his father Ferdinand I, Oct. 4, 1918. He was the eldest son (born Jan. 13, 1894), the other children being Prince Cyril (born Nov. 17, 1895) and the Princesses Eudoxia and Nadeja (born in 1898 and 1899 respectively). He was baptized for political reasons in the Orthodox Greek Church. The ministry appointed Nov. 28, 1918, and holding office at the beginning of 1919 was as follows: Premier and Minister of Foreign Affairs, T. Todoroff (Gueshoff's Party); Minister of the Interior, N. Moushanoff (Democrat); Minister of Finance, Dr. Daneff (Progressive); Minister of Justice, Dr. Djidroff (Unified Socialist); Minister of War, A. Liapcheff (Democrat); Minister of Commerce, I. Sakasoff (Unified Socialist); Minister of Agriculture, D. Draghieff (Peasants' Party); Minister of Public Works, Alexander Stambolisky; Minister of Posts and Railways, M. Bacaloff, (Peasants' Party); Minister of Education, S. Kostwikoff (Radical). The treaty with the Allies was signed on November 27th.

FRENCH CAPITAL IN BULGARIA. The part played by French investment in the economic life of Bulgaria was large, especially in regard to the public finances. The funds for nearly the whole of the public debt of Bulgaria

before the Balkan war were raised on the Paris market. In 1907 the Banque de Paris et des Pays-Bas floated a loan of 145,000,000 francs, the last one raised in France. The same bank in 1912 floated Bulgarian treasury notes not to exceed 80,000,000 francs. Aside from government loans, French interests had, since 1909, taken a considerable part in the development of local industry as for example in sugar manufacture and mining, but the French capital engaged in banking enterprises was greater. French money was also invested in insurance and in Bulgarian public enterprises, such as the construction of the Sofia-Roman Railway, the Oktchilar-Dedeagatch branch on the junction line Salonica-Constantinople. The amount of French capital invested in Bulgaria before the last great war was placed at approximately 700,000,000 francs.

HISTORY

REPORT ON ATROCITIES. The inter-Allied commission published their volume on the alleged Bulgarian atrocities during the summer. It was a work of 635 pages consisting almost entirely of testimony and was entitled *Report of the Inter-Allied Commission Upon the Violations of the Law of Nations, Committed in Macedonia by the Bulgarian Armies*. Since the beginning of the war and even before it many writers had borne witness to the cruelty displayed by the Bulgarians in war time. Frequent charges of this kind had been made during their wars with other Balkan Powers. Greece had repeatedly made these accusations but they had not been believed, and finally the Greek government had prevailed upon the Peace Conference to appoint an inter-Allied commission to make inquiries in Eastern Macedonia, to consist of five members, one from each of the following countries, France, England, Belgium, Serbia, and Greece. Their testimony was complete on April 21st, but the book was not published till the middle of August. From this it would appear that there had been a settled policy on the part of the government at Sofia for the de-nationalization of Eastern Macedonia. In order to make the territorial claims of the government appear plausible, the commissioners declared, Bulgaria had systematically carried out a plan for the destruction of the orthodox Greek population. The inquiry had been conducted in 339 cities and villages and had extended over a population of 305,000. In other words, it had applied to the larger part of the country. The results were classified under arrests, terror, requisitions, forced labor, spoliation, extortion, pillage, starvation, rape, kidnapping of children, taxation, destruction, and deportations. Before the entry of Greece into the war, Bulgarian troops had penetrated with the connivance of the Greek King into Greek Macedonia. In June, 1917, Greece declared war against Bulgaria, but the Bulgarians had already treated the Greek Macedonians as a conquered race. It was reported that they did not resort to the violent methods of the Turks, but especially to starvation as a means of destroying the people. This policy was said to have been carried out deliberately and methodically. Under the pretense of requisitioning they confiscated without any formalities the entire harvest and all the live-stock, and the population of course was immediately brought to the verge of

starvation. Then in the villages they made levies of men and women and even children to serve as workers at a distance and they employed them in military works without shelter or clothes and with a starvation ration. They had at the beginning deported into Bulgarian territory all men between the ages of 18 and 55. Their plan appeared to be to introduce a system of famine, spoliation, execution, and outrage that would make it impossible for the Greeks who survived to remain in the country. The policy was largely successful and in two years the population was nearly annihilated. The figures given in the report were as follows: 94 villages literally destroyed; 32,000 Greeks died on the spot of whom 30,000 perished from starvation or violence; 42,000 were deported into Bulgaria, and 12,000 were forced by their sufferings to immigrate there; of these 54,000, 12,000 died in Bulgaria. The report further concluded that far from being the result of the criminality of an uncontrolled soldiery, the atrocities had been designed and organized by the government of the Bulgarian military staff, and it concluded as follows: "Not a single civilized people would dare apply to criminals under the common law the treatment which the people deported from Eastern Macedonia suffered. How should a government be described which has shown so deep a spirit of treachery; which so readily breaks its word and which disregards the rules of international law and the most elementary principles of the law of nations; which condemns to punishment many thousands of inoffensive persons; which does not hesitate at any means, however barbarous, to satisfy its appetites, cupidity, and ambitions? We simply say that it is a dangerous element not only for its immediate neighbors but for all civilized human beings."

THE NEW MINISTRY. The Bulgarian treaty was signed at Neuilly in the vicinity of Paris on November 27th. Toward the end of the year a new ministry was formed under M. Stambolisky, leader of the Agrarians, who headed the Bulgarian delegation to Paris that signed the treaty. It was composed of members favorable to the Entente and was formed with the programme of signing the treaty and bringing to justice the men of Ferdinand's régime who had led the country to disaster. One of its earliest acts was to order the arrest (November 4th) of all members of the former ministry and of Parliament, and all leaders, officials, and journalists "who by their conduct have given Germanophile tendencies to Bulgarian politics and have contributed to the catastrophe of the country which involved Bulgaria in war." The arrest of 400 persons was ordered and the authorities began at once to carry it out. The Prime Minister on returning from Paris, December 15th, declared at a cabinet meeting that the ex-Czar would be tried and that the government would at once take measures to extradite him. While signing the treaty the government took steps toward a commercial understanding with Greece. A Bulgarian-Greek convention was signed at Paris the same day (November 27th). It permitted free emigration for two years and established a mixed Bulgarian-Greek commission to supervise and promote it. Its main object was to safeguard the interests of the respective racial minorities. The government did not sign the treaty of November 27th with the Entente without a protest. It complained of the loss

of Thrace, the Dobruja, Vidin, Bossilegrad, Strumitza, and Tzaribrod, claiming that a plebiscite would have shown Bulgarian majorities.

BURGESS, GEORGE FARMER. Former member of Congress, died, December 31, at Gonzales, Texas. He was born in Wharton County, Texas, Sept. 21, 1861; was admitted to the bar in 1882, and practiced law for many years. He was presidential elector in 1892 and a member of Congress from 1901 to 1917. In politics he was a Democrat.

BURMA. The largest and most easterly province of British India. Area 230,839 square miles; population (1911) 12,115,217. The population is much diversified in respect to race having nine chief racial groups, of which the Burman is the chief. This main stock with its allied branches came from Tibeto-Burman tribes who originated probably in the interior of Tibet and invaded Burma in the pre-historic period. Burma is separated from China by the Shan States. The chief languages are Burmese, which is spoken by about 8,000,000 and Karen spoken by about 1,000,000. The chief industry is agriculture and rice is grown almost everywhere. Its export in 1916-17 was placed at 2,055,688 tons. Other exports included wheat, cotton, tobacco, sugarcane, onions and a variety of vegetables and fruits. Teak-wood abounds in the extensive forests. Mineral products include petroleum, wolfram, and gems. The petroleum output in 1917 was placed at 291,769,083 gallons. Capital of Lower Burma, Rangoon, with a population of 293,316; of Upper Burma, Mandalay, with a population of 138,299. The lieutenant-governor at the beginning of 1919 was Sir Reginald Henry Craddock.

BURNETT, JOHN LAWSON. Congressman, died at Gadsden, Alabama, May 13. He was born at Cedar Bluff, Ala., Jan. 20, 1854; studied law at Vanderbilt University and was admitted to the bar in 1876, practicing at Gadsden, Ala. He was a member of the Alabama House of Representatives in 1884 and served in Congress from 1899 to 1919. He was chairman of the committee on immigration and naturalization. In politics he was a Democrat.

BUTTER. See DAIRYING.

CADMAN, CHARLES WAKEFIELD. See MUSIC, OPERA.

CALCAÑO, JULIO. Venezuelan writer. See SPANISH LITERATURE.

CALENDAR. See ASTRONOMY.

CALIFORNIA. POPULATION. The population of the State in 1910 was 2,377,549, and on July 1, 1919, it was estimated to be 3,209,792, a gain during the year of 90,000.

AGRICULTURE. The following table is compiled from a report of the Federal Department of Agriculture:

Crop	Year	Acreage	Prod. Bu.	Value
Corn . . .	1919	87,000	2,871,000	\$5,139,000
	1918	85,000	2,975,000	5,742,000
Oats	1919	175,000	5,250,000	5,040,000
	1918	175,000	5,600,000	5,264,000
Wheat . . .	1919	990,000	16,385,000	33,323,000
	1918	506,000	7,590,000	16,894,000
Barley . . .	1919	1,000,000	30,000,000	42,300,000
	1918	1,320,000	34,320,000	39,468,000
Hay	1919	2,352,000	a 4,257,000	73,220,000
	1918	2,376,000	a 2,970,000	50,400,000
Beans . . .	1919	495,000	4,464,000	19,418,000
	1918	592,000	8,584,000	46,354,000
Potatoes . .	1919	88,000	11,352,000	19,412,000
	1918	90,000	12,870,000	15,444,000

Crop	Year	Acres	Prod. Bu.	Value
Cotton	1919	167,000	b 102,000	21,930,000
	1918	173,000	b 67,000	10,103,000
Rice	1919	142,000	7,881,000	21,042,000
	1918	112,000	7,336,000	13,938,000
Hops	1919	11,000 c	17,875,000	13,764,000
	1918	11,000 c	12,500,000	2,500,000

a Tons. b Bales. c Pounds.

TRANSPORTATION. Two railroad companies constructed in 1919 a total of 69.29 miles of new first track. See CHILD LABOR.

LEGISLATION OF IMPORTANCE, 1919 LEGISLATURE: \$1,000,000 appropriation for extension of State land settlement project, including preferential selection of farms by returned service men; \$10,000,000 bond issue for the same purpose, to be voted on in November, 1920; \$40,000,000 highway bond issue, submitted to vote and approved overwhelmingly July 1, 1919; compulsory part-time education law; industrial farm for the rehabilitation of fallen women; vocational reeducation of workmen disabled in industry; raising age limit for compulsory school attendance from 15 to 16 years and the age limit in the child labor law from 15 to 16 years; ratification of the federal prohibition amendment and enactment of State enforcement law; creation of a Department of Agriculture by the consolidation of numerous boards and commissions. An effort was made to introduce anti-alien legislation intended to prohibit leasing of land to Japanese and to make illegal "picture bride" marriages among Japanese. Secretary of State Lansing, who was asked by Senate officials to express his opinion as to the wisdom of reviving the anti-alien agitation, requested that no action be taken. The Senate, under the constitutional rule which prohibits the introduction of bills in the second part of the legislative session, refused to grant permission for the introduction of this legislation. A constitutional amendment was passed, to be voted on in November, 1920, providing for calling a constitutional convention. The general appropriation bill amounted to \$20,596,388 and special appropriations totalled \$9,970,920.02.

FINANCE. According to the report of the State controller, total receipts during the fiscal year 1918-19 were \$50,132,900.37 and total disbursements for the same period were \$50,681,433.48. Cash on hand July 1, 1918, was \$13,865,546.81; on July 1, 1919, was \$14,140,661.17. The assessed value of taxable property on July 1, 1919, was \$4,023,009,588. The net bonded debt on July 1, 1919, was \$44,138,500.

STATE INSTITUTIONS. The total number of inmates in State institutions on Nov. 30, 1919, was 15,169, an increase of 193 over 1918. This was distributed as follows: Industrial Home for the Adult Blind, 139; State reform schools, 734; State hospitals for the insane, 10,124 (85 inebriates); State home for feeble-minded, 1301; State prisons, 2871.

OFFICERS. Governor, William D. Stephens; Lieutenant-Governor, C. C. Young; Secretary of State, Frank C. Jordan; Controller, John S. Chambers; Treasurer, Friend Wm. Richardson; Attorney General, U. S. Webb; Surveyor General, W. S. Kingsbury; Adjutant General, J. J. Borree; Superintendent of Public Instruction, Will C. Wood; Commissioner of Corporations, E. C. Bellows; Librarian, Milton J. Ferguson; Legislative Counsel, Arthur P. Will; President

Railroad Commission, Edwin O. Edgerton; Chairman Industrial Accident Commission, A. J. Pillsbury.

JUDICIARY. Supreme Court: Chief Justice, Frank M. Angellotti; Associate Justices, Lucien Shaw, Henry A. Melvin, William P. Lawlor, Curtis D. Wilbur, Thomas J. Lennon, Warren Olney, Jr.; Clerk, B. Grant Taylor. See AGRICULTURAL EXPERIMENT STATIONS; CHILD LABOR; COTTON; MINERAL PRODUCTION; WORKMEN'S COMPENSATION; OLD AGE PENSIONS.

CALIFORNIA, UNIVERSITY OF. A co-educational State institution, founded in 1860 at Berkeley, Cal. The enrollment for the summer session of 1919 was 4322. The enrollment for the fall term was as follows: College of Agriculture, men 547, women 51; commerce, men 591, women 205; mechanics, men 589, women 2; mining, men 230; civil engineering, men 234; chemistry, men 264, women 20; letters and sciences, men 2216, women 3046; medicine, men 177, women 30; dentistry, men 226, women 19; pharmacy, men 87, women 20; law, men 48, women 4; jurisprudence, men 198, women 31; grand totals, men 5276, women 4002. The teaching staff numbers 696, exclusive of assistants not engaged in instruction. The university library contains 458,000 bound volumes and 185,000 pamphlets. David Prescott Barrows, Ph.D., Professor of Political Science at the university, was elected late in the year to succeed to the office of president, vacated by Dr Benjamin Ide Wheeler in the previous June.

CALL, EDWARD PAYSON. Newspaper publisher, died at Larchmont, N. Y., May 19. He was born at West Cambridge, Mass., Nov. 2, 1855. He was on the Philadelphia Press from 1893 to 1897, and published the New York Evening Post, 1897-1902; Mail and Express, 1902-04; Commercial, 1904-07; and was assistant business manager of the New York Times, 1909-13; and business manager of the Journal of Commerce from 1913 to the time of his death.

CALTHROP, Sir Guy. British Coal Controller, died in London, February 23. He was well known as a railway manager before he was appointed controller of the coal mines during the war. He was born in 1870, entered the service of a railway company in 1886 and had risen in 1902 to the position of general superintendent of the Caledonian Railway, of which he was afterwards general manager. In 1916 the government took possession of the South Wales coal field and soon afterwards State control was extended to the coal-mining industry in general. This resulted in the creation of a new department and Sir Guy Calthrop was put in charge of it under the title of Controller of Coal Mines. Under him a fair system of distribution was organized and the method of fuel rationing, employed to the close of the war, was introduced.

CAMPODIA. A French protectorate in Farther India, a native kingdom forming part of French Indo-China. The territory of Cambodia was increased 7000 square miles by treaty of Mar 23, 1907, providing for boundary changes. The figures for area and population are included with those of other portions of French Indo-China. (see the article FRENCH INDO-CHINA). The capital is Pnom Penh, with a population estimated at over 60,000. The foreign trade is mostly routed through Saigon in Cochinchina. The main products are rice, betel, tobacco, spices,

etc. A large portion of the country is wooded; there is also some cattle raising.

CAMBON, JULES. French representative at the Paris Peace Conference. He was for many years French ambassador in London. His early diplomatic experience was gained in South America and his last diplomatic position was that of ambassador in Berlin, where he saw the preparations for war and kept his government fully informed as to conditions in Germany. He was called into the Briand war cabinet when it was reconstructed, and was then appointed general secretary to the foreign office. From that date he was entrusted with various important tasks and was especially the adviser of the foreign office in matters relating to Franco-American affairs, and to Alsace-Lorraine.

CAMEROON. See KAMERUN.

CAMPANINI, CLEOFONTE. Italian musical conductor, and operatic manager, died in Chicago, Ill., December 19. He was born at Parma, Italy, Sept. 1, 1860, and studied at the Royal Conservatory there. In his youth he was assistant conductor in the first season of Italian opera in the Metropolitan Opera House in New York in 1883. He returned to Europe and his reputation spread rapidly throughout the world. He was the principal conductor of opera at the Covent Garden, London, 1897-1906. From that time his activities were in the United States where he was director of the Manhattan Opera Company, New York, 1906-1909, and of the Chicago and Philadelphia Opera Companies, 1910-13. After 1913 he became general manager of the Chicago Opera Company. He was accounted among the greatest of the world's conductors, and the most famous pieces of the time were produced under him, including *Salome*, *Pelleas and Melisande*, *Samson and Delilah* and *Cleopatra*.

CAMPFIRE GIRLS OF AMERICA. An association founded by Dr. and Mrs. Luther H. Gulick in 1912 for the general purpose of promoting good health by outdoor life, encouraging economy, and effecting social improvement. It is an organized effort to find romance, beauty, and adventure in every-day life. It seeks to make the homely task contribute to the joy of every-day living. Camping-out is a regular feature of the programme each year. A group, consisting of from six to 20 girls, with a Guardian, is called a Camp Fire. The Guardian must be at least 18. Each member pays 50 cents annual dues which goes toward the support of the National Headquarters at 31 E. 17th St., New York City. Each Camp Fire and each Camp Fire Girl has a name and a symbol. Ceremonial meetings are held once a month. The Camp Fire law is as follows: Seek beauty, give service, pursue knowledge, be trustworthy, hold on to health, glorify work, and be happy. Health is considered a sacred thing. During the past year more than 40,000 girls carried out this point of the law by camping in the open for one or more weeks. The second point of the law, "Give Service," was followed by 70,448 girls who maintained gardens, and by 83,356 who contributed money and coöperation with the Red Cross. The following figures exemplify the work of the Camp Fire Girls during the war: over \$1,000,000 of Liberty Bonds were sold in the Third Liberty Loan; \$695,500 Thrift Stamps were purchased; \$903,000 Thrift Stamps were sold; 55,000 girls helped in the support of

French and Belgian orphans, or specially cared for children in poor families in 1918; 37,000 cared for little children, thus freeing older women for other work, 70,000 helped maintain gardens; 68,000 girls earned honors by conservation of food; and in many other ways the Camp Fire Girls aided the government and the various relief organizations.

At a meeting of the Department of Superintendence of the National Education Association, Chicago, Ill., Feb. 24, 1919, a conference with the Camp Fire Girls was held. The Camp Fire movement was thoroughly endorsed, several speeches being made on the subject by prominent educators. An effort is being made to introduce courses in Camp Fire into various colleges and normal schools. The Michigan State Normal College at Ypsilanti has conducted a course of this kind for several years, and in July, 1919, conducted a camping trip to act as a sort of laboratory for the work studied. The New York University Summer School also conducted a thorough course in Camp Fire Training in 1919.

In their Reconstruction Programme, endorsed by President Wilson, they pledge themselves to conserve health and become sturdy and rugged, to create wealth for self and country by saving, and to reestablish the old-fashioned womanhood by making the home more beautiful and happy.

Camp Fire membership consists of 7384 camps and 100,747 members throughout the world: United States, Alaska, Philippine Islands, Hawaiian Islands, Canada, Canal Zone, Porto Rico, South America, England, Scotland, Africa, China, Japan, Korea, and Australia. The officers for 1919 were as follows: Honorary president, Woodrow Wilson; honorary vice-president, William Howard Taft; acting president, Robert Garrett; treasurer, John A. Potter; secretary, Lester F. Scott.

CAMPBOR, ALEXANDER PRIESTLY. Methodist Episcopal Bishop, died at South Orange, N. J., December 10. From 1897 to 1907 he was president of the College of West Africa in Monrovia, Liberia. He was born in Jefferson Parish, Louisiana, Aug. 9, 1865, studied at the Lehigh University 1879-80 and New Orleans University 1880-89; the Gammon Theological Seminary 1893-95, and other institutions. He was professor of mathematics at New Orleans August, 1889-93, served as pastor in parishes in Pennsylvania and New Jersey, and after completing his 10 years' work in Liberia above mentioned was president of the Central Alabama Institute at Birmingham, 1908-16. From 1916 to the time of his death he was Methodist Episcopal Bishop for Africa. He went to Africa on a visit and returned early in 1919 to attend the centennial of his church at Columbus, Ohio.

CANADA, DOMINION OF. A self-governing dependency of Great Britain, lying between the United States on the south and the Arctic Ocean on the north, and extending from the Atlantic to the Pacific. Capital, Ottawa.

AREA AND POPULATION. A total area of 3,729,665 square miles is divided into nine provinces and two territories with a deduction of 125,755 square miles of water area, exclusive of Hudson Bay and other tidal waters. The total population by the last census, June 1, 1911 was 7,206,643, which has reached, according to the estimate of 1917, 8,361,000, with the

inclusion of an Eskimo population of 3300, and an Indian, of 106,000. For details by provinces and territories see 1917 YEAR BOOK, also for distribution of the population by race, color, and sex, and the number of births, deaths, and marriages. The number of immigrants in the year ending Nov. 30, 1919, was 114,768, of whom 54,641 were from the British Isles and 52,141 from the United States. An important change went into effect in 1919 in respect to the rules governing immigration, a law having been passed to provide for a more careful selection of immigrants and bestowing upon the authorities enlarged powers for the deportation of undesirable immigrants.

AGRICULTURE. In 1917, 42,602,000 acres were under field crops; their total value for the year of 1917 was estimated at \$1,145,000,000. The following are the provisional estimates for 1918, according to the *Statesman's Year Book*:

1918	Wheat		Barley

According to a bulletin issued by the Dominion Bureau of Statistics the total yield of wheat for Canada in 1918 is returned as 189,075,350 bushels from 17,353,000 sown acres, an average yield per acre of 10.8 bushels. In 1917 the corresponding figures were 233,742,850 bushels from 14,755,850 acres, a yield per acre of 15.7 bushels. The yield of oats in 1918 was 426,312,500 bushels from 14,790,336 acres, an average of 28.8 bushels per acre, as compared with 403,009,800 bushels from 13,313,400 acres in 1917, an average of 30.2 bushels per acre. Of the remaining grain crops the total yields in 1918, with the figures for 1917 in parentheses, were, in bushels, as follows: Barley, 77,287,240 (55,057,750); rye, 8,504,400 (3,857,200); peas, 3,099,400 (3,026,340); beans, 3,563,380 (1,274,000); buckwheat, 11,375,500 (7,149,400); flax,

6,055,200, (5,934,900); mixed grains, 35,862,300 (16,157,080); corn for husking, 14,214,200 (7,762,700); potatoes, 104,364,200 (79,892,000); turnips, etc., 122,699,600 (63,451,000); hay and clover, 14,772,300 tons (13,684,700); fodder corn, 4,787,500 tons (2,690,370); sugar beets, 180,000 tons (117,600); alfalfa, 446,400 tons (262,400).

The average price per bushel of grain crops in 1918 according to the findings of the crop correspondents of the Dominion Bureau of Statistics was: Fall wheat, \$2.08 as against the same price in 1917; spring wheat \$2.02 as against \$1.93; oats \$0.78 as against \$0.69; barley \$1.00 as against \$1.08; rye \$1.49 as against \$1.62; peas \$2.54 against \$3.54; beans \$5.41 as against \$7.45; buckwheat \$1.58 against \$1.46; mixed grains \$1.14 against \$1.16; flax \$3.13 against \$2.65; corn for husking \$1.75 against \$1.84. The price for potatoes was \$0.98 as compared with \$1 in 1917. Hay and clover have the record price of \$16.25 per ton as compared with \$10.33 in 1917. For alfalfa the price was \$17.84, also the highest on record, as against \$11.59 in 1917. The price of fodder corn was \$6.15 per ton as against \$5.14; and of sugar beets \$10.25 against \$6.75.

The total farm values for 1918, of all the principal field crops were given as follows, the corresponding values for 1917 being in parentheses: Wheat \$381,677,700 (\$453,038,600); oats \$331,357,400 (\$277,065,300); barley \$77,378,670 (\$59,654,400); rye \$12,728,600 (\$6,267,200); peas \$7,873,100 (\$10,724,100); beans \$19,283,900 (\$9,493,400); buckwheat \$18,018,100 (\$10,443,400); mixed grains \$40,726,500 (\$18,801,750); flax \$18,951,000 (\$15,737,000); corn for husking, \$24,902,800 (\$14,307,200); potatoes \$102,235,300 (\$80,808,400); turnips, etc., \$52,252,000 (\$29,253,000); hay and clover \$241,277,300 (\$141,376,700); fodder corn \$29,439,100 (\$13,834,900); sugar beets, \$1,845,000 (\$793,800); alfalfa \$7,963,500 (\$3,041,300).

The total value of the field crops of Canada in 1918 was estimated at \$1,367,909,970, which was the highest on record, and compares with \$1,144,636,450 in 1917. The total includes grain crops, \$932,897,770 (\$875,532,350); potatoes and sugar beets, \$104,080,300 (\$81,598,200); and fodder crops, \$330,931,900 (\$187,505,900).

In the three Prairie Provinces—Manitoba, Saskatchewan, and Alberta—the production of wheat in 1918 was estimated at 164,436,100 bushels as compared with 211,953,100 bushels in 1917; of oats, 222,049,500, as compared with 254,877,200; of barley, 47,607,400, as compared with 40,384,100; of flax, 5,776,000 bushels, as compared with 5,835,900 bushels. The estimated wheat production of Manitoba was 48,191,100 bushels from 2,963,702 acres, in Saskatchewan, 92,493,000 bushels from 9,249,260 acres, and in Alberta, 23,752,000 bushels from 3,892,489 acres. See AGRICULTURE.

FOREST PRODUCTS. The area of land bearing timber of commercial value is estimated at 200,000,000 to 300,000,000 acres divided among the provinces as follows: Quebec, 100,000,000; Ontario, 70,000,000; British Columbia, 50,000,000; Alberta, Manitoba, and Saskatchewan, 11,000,000; New Brunswick, 9,000,000; and Nova Scotia, 5,000,000.

No official statistics of lumbering were available for 1918, but from information published by the *Canada Lumberman* it would appear that production during 1918 was less than in the

previous year. In the Georgian Bay and Northern Ontario districts the production of lumber in 1918 shows a decrease of 107,300,202 feet board measure as compared with the production in 1917. The total cut according to the *Canada Lumberman* amounted to 514,118,455 feet board measure, as compared with 621,418,657 feet board measure in 1917. The decrease in the cut is attributed chiefly to unsatisfactory labor conditions. The high cost of production, absence of export, and frequent embargoes upon the railways were also deterrent factors. A contributing agency was the sudden break-up of winter in 1918, which left in the forests many logs which had not been hauled to the banks of the streams. The production of laths in the district was 109,441,720 pieces, as compared with 226,283,760 in 1917, a drop of 116,842,040 pieces. The shingle production was 11,386,750 pieces as compared with 16,240,250 in 1917, a shrinkage of 4,853,500 pieces.

Production in the Ottawa Valley declined by 78,352,987 feet as compared with 1917; lath was 34,172,250 pieces less, and shingles dropped 16,510,000 pieces. The total lumber output here in 1918 was 349,978,000 feet, compared with 426,330,987 in 1917; lath 40,294,000 in 1918, compared with 74,466,250 pieces in 1917; shingles, 16,815,000 compared with 33,325,000 pieces in 1917.

MINERALS. According to a preliminary report issued by the Department of Mines the total value of the metal and mineral production in 1918 was \$210,204,970. Compared with the production of 1917, valued at \$189,646,821, an increase of \$20,558,149, or 10.8 per cent, is shown.

This table indicates the fluctuations in quantity and value of the principal minerals in 1918 as compared with 1917:

Principal products		Increase (+) or decrease (-) in quantity		Increase (+) or decrease (-) in value	
METALLIC			Per cent		Per cent
Cobalt	pounds..	+ 267,972	24.8	+\$1,641,545	95.0
Copper	do.	+ 9,188,497	8.4	— 524,539	1.8
Gold	ounces..	— 28,305	3.8	— 585,117	3.8
Pig iron from Canadian ore	tons.	+ 1,422	8.1	+ 435,920	56.7
Lead	pounds..	+11,269,979	34.6	+ 427,759	11.8
Molybdenite	do.	+ 89,145	30.8	+ 145,823	50.5
Nickel	do.	+ 9,745,754	11.8	+ 3,098,302	9.2
Silver	ounces..	— 938,667	4.2	+ 2,505,645	13.8
Zinc	pounds..	+ 3,994,926	13.4	+ 105,803	4.0
NONMETALLIC					
Asbestos and asbestic	tons.	+ 4,415	2.9	+ 1,740,396	24.1
Coal	do.	+ 932,454	6.6	+12,552,840	29.1
Graphite	do.	— 663	17.9	— 132,838	33.0
Gypsum	do.	— 184,045	54.7	— 58,978	6.7
Magnesite	do.	— 18,725	82.2	+ 288,490	39.6
Mica	do.	— 90,476	25.2

During the three years down to the close of 1918 greatly enhanced prices of metals and mineral products contributed in large measure toward increasing the total value of the mineral production, but out of 45 items included in the mineral record, 18 reached their highest production in actual quantity during 1918 or 1917. The production of cement, clay products, stone quarries, and other materials of construction, compared with maximum production before the war, was reduced almost one-half because of the enforced cessation of building activity, whereas the output of metals and of various nonmetals and fuels, most of which entered directly or indirectly into the requirements of the war was

greatly increased. More than half the total increase was due to the higher prices obtained for coal, and a considerable proportion of the remainder of the increase to higher prices of silver, cobalt, and asbestos, though each of these products except silver was also produced in greater quantity than in the previous year. The metal output in 1918 was valued at \$113,563,111, an increase of \$7,107,964, or 6.6 per cent over 1917. The total value of the non-metallic production, including clay and quarry products, in 1918 was \$96,641,859, as compared with \$83,191,674 in 1917, showing an increase of \$13,450,185, or 16 per cent.

MANUFACTURES. During the year the Dominion Bureau of Statistics completed its census of manufactures for the year 1917 and has issued returns that cover 34,380 establishments, and show a remarkable development when compared with the year 1915, as shown by the following table:

Items	1917	Increase over 1915
Capital invested	\$2,772,517,680	\$778,414,408
Employees on salaries	a 73,598	a 20,915
Salaries paid	93,983,605	35,675,213
Employees on wages, including piece work	a 619,473	a 157,273
Wages paid	457,245,456	227,789,246
Cost of materials	1,602,820,631	800,686,769
Value of products	3,015,506,869	1,608,369,729

a Number.

The gross value of goods manufactured in Canada in 1917 amounted to \$3,015,506,869 and the cost of materials was \$1,602,820,631, leaving a net value of \$1,412,686,238 or \$5,549,098 more than the gross value of production in 1915.

The amount invested in leading industries was: Electric light and power, \$356,004,168;

pulp and paper, \$186,787,405; log products, \$149,266,019; cars and car work, \$98,274,585; steel furnaces and rolling mills, \$91,894,777; flour and grist mill products, \$72,573,982; agricultural implements, \$70,493,801; foundry and machine shop products, \$69,915,032; car repair shops, \$68,763,298; slaughtering and meat products, \$68,145,347. Canada has nearly a monopoly of the newsprint paper used in the United States, supplying over 56 per cent used, besides supplying her domestic demand entirely. After August, 1914, many new industries developed in Canada as a result of war conditions. Among them may be mentioned: Margarine, candied peel, phonograph records, steel

for motor-car frames, galvanized sheets, beet-slicer knives, steel barrels, ribbed hosiery, knitting machinery, equipment for electric furnaces, semitortary double-acting pumps, steel plates, gear hoppers, machine tools, alloys, a considerable range of chemical products, machinery of various kinds, collapsible baskets, electric bulbs, semaphore lenses, and ruby lantern globes.

COMMERCE. Canada's foreign trade in 1918 showed a decrease over that of the previous year in imports and exports. Total imports in 1918 were worth \$906,954,900 as compared with \$1,005,071,716 in 1917, a decrease of \$98,116,816 or 9.8 per cent. Total exports for 1918

Imports and exports	12 months ending Sept. 30—	
	1918	1919
Exports—		
Canadian	1,358,419,580	1,201,801,387
Foreign	42,761,192	58,511,284
Total exports, merchandise	\$1,401,180,772	\$1,260,312,671

The United States supplied \$38,000,000 less of Canada's imports in the year ended Sept. 30, 1919, than it did in the preceding 12 months, but took nearly \$13,000,000 more of Canada's merchandise exports, as the following table shows:

Countries	1918	Imports from		Exports to	
		1919	1918	1919	1918
United Kingdom	\$70,598,856	\$79,023,483	\$712,670,484	\$540,378,091	
Australia	2,767,072	4,215,120	11,844,103	12,510,332	
British East Indies	16,775,873	12,800,718	2,322,708	5,443,797	
British Guiana	5,411,468	9,039,973	2,360,770	2,630,722	
British South Africa	996,140	1,072,898	8,205,301	9,918,777	
British West Indies	7,639,737	10,420,957	8,451,395	10,358,556	
Hongkong	2,291,770	1,611,703	820,026	1,126,718	
Newfoundland	3,164,166	2,456,324	11,492,275	13,160,904	
New Zealand	6,375,862	5,329,798	4,900,966	6,448,688	
Other British Empire	1,855,559	743,584	2,109,256	6,648,428	
Total, British Empire	117,876,503	125,714,553	765,177,284	608,625,013	
United States	739,463,574	701,087,586	420,865,838	433,337,935	
Argentina	1,060,383	1,609,973	1,973,595	5,945,084	
Brazil	771,574	1,478,452	3,911,636	1,871,128	
China	1,767,702	1,322,132	3,021,096	2,565,604	
Cuba	1,790,601	7,542,830	4,042,994	6,045,767	
France	4,112,771	4,848,857	131,460,692	73,688,731	
Italy	650,993	495,302	6,474,042	19,664,534	
Japan	13,480,013	12,500,342	8,642,930	9,542,377	
Netherlands	689,912	929,461	1,644,649	2,264,927	
Other foreign countries	10,887,858	28,604,555	11,204,824	38,250,287	
Total, foreign countries	780,675,381	760,419,490	593,242,296	593,176,374	
Grand total	\$898,551,884	\$886,134,043	\$1,358,419,580	\$1,201,801,387	

were \$1,229,708,244, as compared with \$1,547,340,855 the year previous, a difference of \$317,632,611 or 20.5 per cent. There was, however, a substantial balance of trade in Canada's favor, exports amounting to \$322,753,344 over imports, or 35.5 per cent.

The following statement gives a summary of Canada's trade for the calendar year 1918 compared with 1917:

Items	1917	1918
Imports for Consumption—		
Dutiable goods	\$557,636,509	\$511,125,417
Free goods	447,435,207	395,829,483
Total imports	1,005,071,716	906,954,900
Duty collected	167,041,330	154,849,472
Exports—		
Mineral products	77,389,963	75,708,425
Fishery products	28,323,877	33,577,772
Forest products	52,280,875	65,436,204
Animal produce	170,561,884	176,407,332
Agricultural prod	531,300,259	320,524,859
Manufactures	682,431,692	552,683,692
Miscellaneous	5,052,305	5,369,960
Total exports	\$1,547,340,855	\$1,229,708,244

The trade of Canada for the 12 months ending Sept. 30, 1919, as compared with the corresponding period of 1917-18 is as follows:

Imports and exports	12 months ending Sept. 30—	
	1918	1919
Imports for Consumption—		
Dutiable goods	\$514,219,510	\$550,516,656
Free goods	884,332,374	335,617,387
Total imports, merchandise	898,551,884	886,134,043
Duty collected	154,869,499	158,435,970

The Canadian Trade Commission, to which was transferred by order-in-council all functions, powers, and duties formerly vested in the War Trade Board, approved a general license permitting the importation of all commodities restricted from importation by the War Trade Board during the war, except foodstuffs. The trade commission has also approved regulations by which collectors of customs at ports of exit may, by endorsement of the usual shipper's export entries, license shipments of all commodities except the following. Gold coin, gold bullion, fine gold bars, Canadian silver coin, silver bullion, fine silver bars, cinchona bark and products, quinine and its compounds, cocaine, opium, opium gum and its products, wheat, wheat flour and farina, butter, cheese, sugar, sirup and molasses, mill screenings and screenings of grain, and canned salmon. For the foregoing individual licenses are required to all destinations.

RAILWAYS. In 1919 433.31 miles of new first track and 9.15 miles of new second track, or a total of 442.46 miles, were completed and put in service in the Dominion of Canada. This amounts to three times as much as that of 1918—135.08 miles of first track and 4.28 miles of second track, a total of 139.36 miles—and was greater than for any year since 1915, though of course not to be compared with 1913 when almost 3000 miles was built. The new construction in 1919 was by six different companies, the Alberta and Great Waterways building in Alberta 8.1 miles of first track; the Canadian National 148.05 miles of first track in Alberta, Saskatchewan and Manitoba, and 6.75 miles of second track in Alberta; the Kettle Valley 5.75 miles of first track in British Columbia; the

Pacific Great Eastern 113 miles of first track in British Columbia, and the St. John and Quebec 70 miles of first track in New Brunswick, and 2,40 miles of second track. On the Grand Trunk Pacific the diversion project at Firdale, Manitoba, where temporary trestles were being replaced with permanent openings and roadway at a cost of \$420,000, was 67 per cent complete. At Toronto the new terminal station was making progress.

The most important railway event of 1919 was the taking over of the Grand Trunk by the government following the policy of government ownership or operation, or as it was termed nationalization, which had been developing in Canada for some 10 years previously. This step was necessary in the government's plan of railway nationalization and unification both to bring the province of Ontario into communication with the Grand Trunk Pacific, whose operation had been unproductive, and which with the Grand Trunk Pacific Branch Lines had passed into the hands of a receiver, and to relieve the Grand Trunk which with the government was a guarantor of the Grand Trunk Pacific.

The taking over of the Grand Trunk in November, 1919, thus brought into the hands of the Canadian government what was consolidated into the largest railway system on the American continent, and a government operated mileage comparable with, though less in extent, those of Germany, India and Austria-Hungary. These lines were under the control of the Canadian National Railways Company, a government corporation, which was in the unique position of controlling some 1900 miles of line within the territorial limits of the United States. The mileage in 1919 of the various lines which were to be operated as a single system was as follows:

Intercolonial	1,592.35
Prince Edward Island	278.81
Transcontinental	2,002.92
Canadian Northern	9,479.17
Grand Trunk Pacific	1,794.07
G. T. P. branch lines	1,036.79
Grand Trunk in Canada	3,578.80
Grand Trunk in United States	1,665.00
Lines in maritime provinces	485.00
Total	21,912.91

The problems of this vast combination were considered not only interesting but severe. In 1918 every one of these roads had a deficit which in the aggregate was said to amount to over \$26,000,000, considering merely income and expense. Furthermore the new government system inevitably must compete with the Canadian Pacific, which with a mileage of approximately 13,000 at the end of 1919 was the only remaining privately owned line in Canada. This road had a very small funded debt and the government had no direct financial interest in it. In addition it was in excellent physical condition. There was considerable difference of opinion as to the advantage or effects of such competition, but it was thought that a practical comparison between two large trans-continental systems, one under private and the other under government operation would go a long way towards settling the merits of the two methods. See CANALS.

TROOP MOVEMENTS ON CANADIAN LINES. During the year, Maj.-Gen. J. Lyons Biggar, quartermaster general of the Canadian army, pre-

sented statistics regarding "the admirable services" of the railway and steamship companies in the movement of troops during the war. The following is the number of troops which were carried by the various railways:

CANADIAN PACIFIC		
	Mobilization	Demobilization
Canadian troops	158,826	175,567
United States troops	54,810
Chinese coolies for overseas	81,530
French battalion, Serbian, Montenegrin and Polish reservists	16,108
Imperial troops	9,082
Total	306,269	184,599
GRAND TRUNK		
Canadian troops	200,273	105,259
United States troops	118,180
Total	318,453	105,259
CANADIAN NATIONAL		
Canadian troops	339,172	267,436
United States troops	5,843
Total	345,015	267,436

The number carried by the Canadian Pacific steamships was as follows:

CANADIAN PACIFIC		
	Eastbound	Westbound
Canadian troops	121,097	80,811
United States troops	18,407	2,120
Chinese coolies	37,084	3,120
Prisoners of war	1,424
Total	177,962	86,051

The following official figures were published, December 3d, showing casualties and numbers engaged in the war:

	Officers	Other ranks	Total
Killed in action and died of wounds	2,559	48,557	51,116
Accidentally killed	5	8	13
Died of disease	292	4,613	4,905
Wounded	5,349	143,510	148,859
Presumed dead	187	4,915	5,102
Missing	57	57
Deaths in Canada	2,633	2,633
	8,392	204,293	*212,685
Total prisoners of war	236	3,493	3,729
Repatriated	204	3,086	3,290
C E F., Siberia Forces: 4 accidentally killed, 13 died of disease, 1 wounded			
Enlistments up to Nov. 15, 1918			†595,441
Sailings for England			418,052
Sailings to Siberia			4,214
Total that went overseas			†422,266

* Represents nearly 3 per cent of Canada's total population of 8,000,000. † Over 7 per cent of population. ‡ Five per cent of population.

FINANCE. Gold is the standard of value with a monetary unit of the dollar similar to the United States. Revenues supply a consolidated fund from which are paid the expenditures incident to the fiscal year which ends March 31. A second fund, the miscellaneous accounts, provides for loans, redemption of debt, railway administration, expenditures on capital account for public works, etc.

Detailed estimates for the year ending Mar.

31, 1919, according to the *Statesman's Year Book* were:

<i>Services</i>	<i>Dollars</i>
Public debt (including sinking funds) . . .	78,119,502
Charges of management	518,850
Civil government	8,143,633
Administration of justice	1,552,883
Police, Dominion	146,765
Penitentiaries	991,600
Legislation	1,850,154
Arts, agriculture, and statistics	4,260,152
Quarantine	241,000
Immigration	1,135,000
Pensions	16,146,575
Superannuation	400,000
Militia and defense	4,212,600
Railways and canals (chargeable to income)	33,071,387
Mail subsidies and steamship subventions	1,906,901
Ocean and river service	1,947,800
Lighthouse and coast service	1,939,500
Scientific institutions	405,000
Marine hospitals	78,000
Steamboat inspection	79,221
Fisheries	1,035,000
Subsidies to provinces	11,369,148
Department of Mines	427,900
Indians	1,879,188
Mounted police	1,127,778
Government of Northwest Territories	8,000
Government of Yukon Territory	185,000
Dominion lands (chargeable to income)	2,531,645
Miscellaneous	6,555,531
Custons	4,665,000
Excise	1,523,768
Weights and measures, gas and electric light inspection	394,510
Adulteration of food, etc.	53,500
Railways and canals (chargeable to collection of revenue)	1,648,500
Public works (chargeable to collection of revenue)	935,900
Public works (chargeable to income)	7,595,363
Post Office	19,116,261
Trade and commerce	1,712,595
Naval service	1,530,000
Labor	75,000
Total consolidated funds	224,332,110
Railways and Canals (capital)	23,813,000
Public Works (capital)	4,456,000
Public Works, Marine Dept. (capital)	691,900
Total capital	28,460,900
Grand total	252,793,010

In the spring there was some criticism of the government's financial policy during the war as leading to an unnecessary increase in the body of the currency. Before the war the Dominion notes outstanding June 30, 1914, amounted to \$114,182,100 of which \$94,664,482 were owned by banks, and the rest were in public securities. Against this the Canadian treasury held at the same date \$92,663,575 in gold. On Feb. 28, 1919, the Dominion outstanding notes amounted to \$306,405,599 of which Canadian chartered banks held \$185,932,418, which therefore had increased about threefold their holdings since June, 1914. On \$104,000,000 of their resources the banks were now receiving no interest. The critics maintained that as the result of the situation the currency had been diluted since June, 1914, by the addition of \$98,000,000 of irredeemable currency. Various remedial measures were under discussion during the year.

According to a statement issued by the Finance Department, the net debt of the Dominion at the end of December, 1918, was \$1,330,228,898, compared with \$976,428,504 at the end of 1917, an increase of \$353,800,394, or slightly over 36 per cent. The statement given below shows the details of revenue and expenditure for the nine months of the fiscal year (April 1 to Dec. 31, 1918):

<i>Revenue and expenditure on account of consolidated fund</i>		<i>April 1-Dec. 31, 1918</i>
Revenue:		
Customs	\$113,284,019	
Excise	22,839,887	
Post office	14,900,000	
Public works (including railways and canals)	31,089,476	
Miscellaneous	40,372,170	
Total	\$222,485,552	
Expenditure		
	\$124,539,099	
Expenditure on capital account:		
War	224,408,107	
Public works (including railways and canals)	11,830,420	
Total	\$286,238,527	

The following table shows the value of bond sales in 1918 compared with the figures for 1917:

<i>Bonds</i>	<i>1917</i>	<i>1918</i>
Government bonds	\$694,182,500	\$733,648,729
Municipal	26,104,067	45,805,720
Railways	22,566,666	5,000,000
Public service (including Canadian companies operating in other countries)	15,425,000	2,375,000
All other	17,067,800	5,155,000
Total	\$775,346,033	\$791,984,449

A recent table of subscriptions to the Victory Loan shows a total of \$695,389,227. Taking the Dominion as a whole, one person in every 7.08 subscribed, as compared with one in every 9.02 in 1917. The Dominion averaged \$88.91 per capita compared with \$53.37 the previous year. It has been announced that of the total subscribed the Dominion government has accepted \$660,000,000, the balance to be turned back to some of the largest subscribers.

General progress in all branches of the banking business is recorded by the figures given in the Canadian bank statement issued by the Finance Department to the end of December, 1918. The following is a summary:

<i>Items</i>	<i>1917</i>	<i>1918</i>
Deposits on demand	\$569,441,871	\$711,034,060
Deposits after notice	995,978,013	958,478,557
Current loans in Canada	858,533,298	1,075,640,008
Current loans elsewhere	111,581,098	119,153,924
Loans to municipalities	36,353,039	30,684,052
Call loans in Canada	71,779,020	89,120,423
Call loans elsewhere	134,483,482	150,248,322
Circulation	208,753,337	240,705,540
Total assets	\$2,323,163,783	\$2,689,835,181

DEFENSE. Under the Military Act of 1914, the Governor General exercises the power as commander-in-chief of the militia, as representative of the King. There is a Minister of Militia and Defense and a Council of Militia and Defense, which includes besides the Minister, four military members and one finance member. The division of forces in 1919 is: a fighting echelon in France of 150,000; a training echelon in England who are employed on Forestry and Railways; a recruiting and preliminary training unit in Canada. In December, 1918, demobilization commenced, with the retainment of 100,000 men in France provided for. Up to October, 1918, there had been sent overseas for active service with the Canadian Expeditionary

Force, 418,502 officers and men, and at the same time 35,013 men of all ranks were training in Canada. The plans for a Canadian navy have been in abeyance for some time; at present there are only a few fighting craft for the protection of commerce.

GOVERNMENT. The legislative power is vested in a Parliament of two Chambers, the Senate, and the House of Commons, with a term of five years. At the beginning of 1918 there were 96 Senators; these are nominated by the governor-general for life terms. The members of the House of Commons are elected by direct suffrage and numbered 235 in 1918.

The ultimate executive authority is vested in the king, exercised in his name by the governor-general and the ministry, who, in turn are responsible to the House of Commons.

The numerical representation by provinces in the Senate was: Prince Edward Island, 4; Nova Scotia, 10; New Brunswick, 10; Quebec, 24; Ontario, 24; Manitoba, 4; Saskatchewan, 4; Alberta, 4; British Columbia, 3. This was increased in 1917 to six from Prince Edward Island, Alberta, Saskatchewan, Manitoba, and British Columbia; the other provinces remaining the same. The House of Commons has a representation as follows: 82 from Ontario, 65 for Quebec, 16 from Nova Scotia, 11 for New Brunswick, 15 for Manitoba, 13 for British Columbia, 4 for Prince Edward Island, 16 for Saskatchewan, 12 for Alberta, and 1 for Yukon Territory.

In the last election, December, 1917, the constituencies were divided in the following party alignments: Unionist 151, and Opposition 81. The Ministry at the close of the year was as follows: Governor-General, the Duke of Devonshire, appointed Aug. 19, 1916; the main heads of the king's privy council: Premier Sir Robert Laird Borden; President of the Privy Council, and Minister of Health, Newton W. Rowell; Secretary of State and Minister of Mines, Martin Burrell; Minister of Trade and Commerce, Sir George E. Foster; Minister of Justice, Charles J. Doherty; Minister of Marine, Fisheries, and Naval Service, Sir Charles C. Ballantyne; Minister of Militia and Defense, Maj.-Gen. Hon. Sydney C. Mewburn; Minister of Overseas Forces, Sir Edward Kemp; Postmaster General, Pierre E. Blondin; Minister of Agriculture, Simon F. Tolmie; Minister of Public Works, Arthur L. Sifton (H. K. MacLean without portfolio); Minister of Finance, Sir Henry L. Drayton; Minister of Railways and Canals, John D. Reid; Minister of the Interior, Arthur Meighen; Minister of Immigration and Colonization, James A. Calder; Minister of Labor, Gideon Robertson; Minister of Customs and Internal Revenue, vacant; Minister of Soldiers' Civil Reestablishment, Sir James Loughheed.

LEADERSHIP OF THE LIBERALS. After the death of Sir Wilfrid Laurier (q.v.), it was announced on February 24th, that his temporary successor as leader of the opposition in the House was Mr. Daniel D. Mackenzie, member for Cape Breton since 1901; and while it seemed not unlikely that he would remain the permanent leader, there was much speculation as to the permanent choice. Among others mentioned were Messrs. W. S. Fielding, W. L. Mackenzie King, George P. Graham, W. M. Martin, and A. B. Hudson, and Sir Lomer Gouin. The last-named who was Premier of Quebec and had shown much tact in

dealing with the race difficulties during the war was especially favored in certain quarters, but by many it was believed that Laurier's successor should be an English-speaking Protestant in recognition of that numerous element in the Liberal party which had been loyal for over 30 years. In the summer, opinion seemed to incline toward Mr. Mackenzie King, Minister of Labor, who had enjoyed in exceptional degree the confidence of the late leader.

ARMY RIOT. The report of a riot in the Canadian camp at Kinnel Park was published on March 7th. It was said to have arisen chiefly from the discontent of the men at the delay in getting home, which was aggravated by the fact that the sailing of several boats had recently been cancelled. Some of the rioters raised the red flag, but the Bolshevik element was described as unimportant, the Reds being of foreign birth. Five of the men were killed and 23 injured.

THE SITUATION IN QUEBEC. The animosities of war time (see preceding YEAR BOOK) continued to some degree and conditions during the first part of the year were reported as unsatisfactory. An organ of the Nationalists declared that it would not regret to see Quebec refuse all advances and maintain for some time to come her full independence and liberty. Attacks upon the Union Government were frequent, despite the conciliatory attitude of some of the latter's spokesmen and their plea for generous treatment of Quebec.

TRANSITION TO A PEACE FOOTING. Labor troubles were incidental to the passage from peace to war in Canada as elsewhere. Early in the year the government appointed a commission representing employers and labor leaders to consider how far labor might be represented in industry. Its programme was given out as follows: First, to consider and make suggestions for securing a permanent improvement in the relations between employers and employees. Second, to recommend means for insuring that industrial conditions affecting relations between employers and employees shall be reviewed from time to time by those concerned with a view to improving conditions in the future. Third, to make a survey and classification of existing Canadian industries. Fourth, to obtain information as to the character and extent of organization already existing among employers and employees respectively. Fifth, to investigate available data as to the progress made by established joint industrial councils in Canada, Great Britain, and the United States.

In regard to the labor situation, see below. As to the restoration of trade, the government took the important measure of providing over \$100,000,000 as credits for exports to Great Britain, Greece, Rumania, and Belgium.

LABOR CONDITIONS. On April 9th a Royal Commission of seven members representing labor and capital was appointed on account of conditions arising from the high cost of living, to investigate industrial affairs and suggest means of improving the relations between the employer and the employee. The majority report was more sympathetic with the demand of labor than the report of the minority. Meanwhile a Cost of Living Commission had been appointed and had reported in favor of abolition of combinations and a more careful regulation of business by means of a national board of commerce; but

Parliament took no action on the matter. General strikes were in progress during the sessions of these commissions and in spite of the government's efforts the great strike of Winnipeg was effected. There was a considerable Bolshevik element in the working class, and there was early in the year a "One Big Union" movement in the West, like that in Australia (q.v.), but it was opposed by the officers of the Trades and Labor Congress and by the conservative unionists as a whole. It was strong, however, in parts of the Far West and had a good many adherents in Toronto.

THE STRIKE IN WINNIPEG. At the beginning of June industrial conditions were threatened by one of the most serious strikes of recent years. It occurred in Winnipeg, the metropolis of western Canada, and originated in a dispute between the union of metal works and the local iron foundries. The majority of the latter were uncompromising opponents of unionism, and refused to deal with any representative of the metal workers' union or to recognize the principle of collective bargaining, though they were ready to meet and negotiate with their individual workmen. Attempts at arbitration failed and upon the declaration of the strike the whole working class (95 unions in all) went on strike sympathetically. Firemen, police, postal employees, telegraph and telephone operators, etc., joined in the revolt. As a result the city was practically cut off from the rest of the world, and as it was a commercial centre for all of western Canada, the consequences were serious. The war veterans' association in Winnipeg openly expressed sympathy with the strikers and when a demand was made upon the returned soldiers to join the militia, there was practically no response. The proposal to declare martial law was rejected as certain to make matters worse and perhaps to result in a strike throughout the entire country. The labor element in Canada, though conservative before the war, had rapidly developed radical tendencies, and comprised an increasing element that favored direct action. The control of Winnipeg passed completely into the hands of the strikers, and the government was under the direction of a workmen's Soviet. Alarm among all business classes in Canada and elsewhere was expressed over what was declared to be a manifestation of Bolshevism. See **ARBITRATION AND CONCILIATION, FINANCIAL REVIEW, INDUSTRIAL WORKERS OF THE WORLD, LABOR LEGISLATION, MINIMUM WAGE, STRIKES AND LOCKOUTS, TAXATION, TRADE UNIONS, UNEMPLOYMENT, WAR FINANCE.**

CANALS. Discussion rather than construction characterized the inland waterway situation the world over. It was realized that rail transportation in many countries required at least to be supplemented, while mounting cost seemed to suggest that water borne traffic would be more economical in many localities. Particularly where terminals immediately accessible were available the idea of water transportation was beginning to appeal with more force, and it was further realized that the canalization of a number of rivers could be undertaken with profit.

ILLINOIS DEEP WATERWAY BILL. During the year the Governor of Illinois signed a bill for a deep waterway connecting the Chicago Drainage Canal with the Illinois River, thus linking the Great Lakes and the Mississippi, together

with a bill authorizing an issue of bonds to the amount of \$20,000,000, which had already been approved by public vote. The project must be submitted to the U. S. War Department for its approval, but the construction, maintenance and operation of the proposed waterway and its various appurtenances were placed in the hands of the Illinois State Department of Public Works and Buildings, which is empowered either to let contracts or to perform the work with its own forces. The general route of the canal is from the water-power plant of the Sanitary District of Chicago at Lockport, which is the end of the Drainage Canal, following its tailrace, the Des Plaines River and the Illinois and Michigan Canal through Joliet, and then the Des Plaines River and Illinois River to a point on the latter near Utica. If the two rivers cannot be utilized, the route may be changed to the Illinois and Michigan Canal or to new channels outside the rivers. The project calls for a bottom width of not less than 150 feet, with a depth of not less than 8 feet in earth and 10 feet in rock. For the locks, minimum dimensions of 110 x 600 feet were specified, with 14 feet of water on the mitre sills. Through Joliet it is proposed that the water level should not be higher than 40.5 below Chicago datum, or 41 feet, if certain shoals are deepened, and the width must not be less than 270 feet. Through Ottawa the level must not be higher than 120.5 below the Chicago datum.

THE CHICAGO DRAINAGE CANAL. An interesting development in connection with canal construction in the United States was the decision to prepare plans for a trunk highway about 60 miles long from Chicago to Waukegan and Joliet, Ill., along the right of way of the existing canals. This plan was to utilize large quantities of rock from the old spoil banks and contemplated the construction of an 18-foot road from Chicago to Waukegan and a 30-foot road from Chicago to Joliet, with due regard to the possibilities of motor truck traffic.

ATLANTIC TO GULF CANALS. During the year there were introduced into the House of Representatives two bills providing for canal construction between the Atlantic Ocean and the Gulf of Mexico. Bill H-R 6560 provided for a survey and estimate of cost of a sea level or lock ship canal from the mouth of the Altamaha River in Georgia through a series of rivers in Georgia to the Apalachicola River in Florida, thence down that river to its mouth in the Gulf of Mexico. A survey for a similar canal from Cumberland Sound on the Atlantic Ocean up the St. Mary's River across the States of Georgia and Florida to the Gulf of Mexico at or near St. George's Sound was the subject of Bill H-R 6558.

CHESAPEAKE AND DELAWARE CANAL. The Chesapeake and Delaware Canal, about 15 miles in length, from Delaware City on the Delaware River to Chesapeake City, Maryland, on a stream flowing into Chesapeake Bay, was formally taken over by the United States government, and the event celebrated at Delaware City on October 11th. This canal was chartered in 1799, but was acquired by the national government under an appropriation of \$2,514,290 by Congress and about \$500,000 additional for deepening and widening. It was proposed to make this a sea level canal, which would require an increased excavation of 10 feet for a considerable distance at

the summit. When enlarged, this canal will complete an inland waterway from Philadelphia to Norfolk. The improvement of this canal was investigated during the year by the Engineer Department of the U. S. army, and the sum of \$2,000,000 was asked for for dredging, purchase of land for right of way and for contract work on high land elevation.

CANALS AT SAULT STE. MARIE. The fourth lock at the American Canal at Sault Ste. Marie, Michigan, was thrown open to traffic on Sept. 18, 1919. This lock, the construction of which has been discussed in previous issues of the YEAR BOOK (See INTERNATIONAL YEAR BOOK for 1914 and 1915), is a companion lock to the so-called Davis or third lock, each being 1350 by 80 feet in plan, with a depth of 24.5 over the mitre sills. The construction of the fourth lock was carried on throughout the war, though this work had to be done by force account. The lock was named the Sabin Lock, in honor of L. C. Sabin, the general manager of the canal, an engineer who has been connected with this work for many years. It is operated by electricity. The opening of the lock was not attended by special ceremonies, the various government craft in the neighborhood and a large freighter being successfully locked through. Eight minutes is the time required to raise or lower the craft in the lock a distance of 20 feet and two of the largest lake freighters can be accommodated tandem. The cost of the new lock was in excess of \$2,500,000.

Traffic in both United States and Canadian canals was considerably less in 1919 than in the previous year. The registered tonnage passing through the U. S. Canal, represented by 13,517 vessel passages was 43,803,991 tons net and through the Canadian Canal 4070 vessel passages and 6,485,099 registered tonnage net, or a total of 17,587 vessel passages and a registered tonnage of 50,089,090 in 1919, as compared with 20,610 vessel passages and a registered tonnage of 61,100,244 in 1918. The total freight passing through the canals in 1919 was 68,235,542 short tons of which 64,097,583 passed through the U. S. Canal and 4,137,959 through the Canadian Canal. Of the total freight going through the canals 52,831,205 short tons were east bound and 15,404,387 short tons were west bound. The total freight represented a decrease of 17,444,785 short tons or 20 per cent over 1918. The number of passengers, 56,992, passing through the canals represented an increase of 63 per cent over the number in 1918, 34,990, the greater number of passengers in 1919 using the Canadian Canal. There was also an increase in the amount of grain carried, 52,734,355 bushels in 1919 as compared with 30,800,621 bushels in 1918. In wheat there was a shrinkage of 7 per cent or from 122,718,146 bushels to 113,734,848 bushels and in iron ore of 23 per cent or from 60,551,296 short tons to 46,922,792 short tons. Soft coal showed a decline from 15,770,560 to 11,461,962 short tons.

The United States canal was in operation from April 10 to Dec. 15, 1919, or 250 days, while the Canadian Canal was opened April 12 and closed Dec. 15, 1919, or a season of 248 days.

CANADIAN CANALS. The construction of the Welland Canal, which had been resumed after the war, was shut down in the summer of 1919 by order of the Department of Railways in Ottawa, because of labor difficulties. The work had been interrupted during the latter part of the war, and was resumed in large measure as a

means of social relief. Demands for higher wages and labor unrest were responsible for the closing down of work. The construction of the new Welland Ship Canal was thought to present many possibilities for the Canadian inland waterways. During the year preliminary surveys were in progress by the Canadian Government, looking towards the construction of a St. Lawrence canal system capable of taking such ships as could be accommodated by the Welland Canal when completed. This water way has a mitre sill depth of 25 feet, which is greater than the depth of the St. Lawrence marginal canal. The new project was to include a new canal extending from Cardinal to Cornwall, doing away with the locks at Cardinal, Morrisburg, Fabian's Point, and Cornwall, and would involve the construction of a new canal located farther back from the river than the existing one.

EUROPEAN CANALS. In September, 1919, a Congress on Internal Waterways was held at Strassburg at which the traffic results of the Rhine navigation and improvement were considered and some remarkable figures were submitted. The proposed canal between the Rhine and the Marne was also discussed and the general policy of developing waterborne traffic which was a great urgency with the deficiencies of transportation in western Europe. The five years of war had shown the value of its inland waterways to France and their increased use did not present any striking obstacles.

As a result of such policy it was announced toward the end of 1919 that a new section of canal would be constructed to permit 300 ton ships to navigate along the entire lengths of the Rhone and the Rhine. Furthermore the canal connecting the Marne with the Rhine and the Sarre basin would be electrified throughout so as to substitute electric towage for horse towage. Another important development was the construction of three canals in the valleys of the Moselle and the Fruchtz to complete the water connection of Metz and Thionville.

Another French project advanced during 1919 aimed to put Dieppe into direct waterway communication with Paris by constructing a canal from Dieppe to Rouen. It was announced that the scheme had progressed to a stage where parliamentary powers would be applied for to carry out the undertaking. The necessary capital was guaranteed for the work, which would require about five years.

CANARY ISLANDS. A group of islands off the northwest coast of Africa, province of Spain. Area, 2808 square miles. The census of Dec. 31, 1910, gave the population as 444,016; while the estimate of Dec. 31, 1916, places it at 497,995. The capital, Santa Cruz de Teneriffe, had a population of 63,004 in 1910, which was estimated at 79,889. Next in size to the capital is Las Palmas with an estimated population in 1917 of 69,758. The leading exports are tomatoes, bananas, potatoes, and wheat.

CANCER. As time progresses certain facts about cancer stand out in an increasingly bold relief, some of which run counter to popular and even professional beliefs. It is clearly increasing in incidence and at present is claiming 80,000 annual victims in the United States alone. There is a certain racial immunity, as shown for example in the low incidence of cancer among the reservation Indians. The part played by prosperity and high civilization in the cause of

the disease, which appears to be a notable one, will be better understood when the figures of cancer incidence during the years of the great war have been published; for millions of people were and still are living on a very low ration and often under primitive conditions which approximate those of semicivilized races. Cancer is not properly a disease of old age, but of upper middle age and appears to occur with increasing frequency in young subjects; so that the surgeon no longer thinks it unique if he encounters the disease in the early twenties. Inheritance of the cancer tendency is vague, but "cancer families" are known in which the disease appears at a relatively early period and attacks unaccustomed localities. Cancer is one of the few "diseases of the robust," and the exuberant health and vigor of many of these subjects almost suggest the presence of some unhealthy vital stimulus such as is seen in the redundant health of the Tyrolean arsenic eaters. It is now only too evident that surgery cannot be depended on to cope with the disease as a racial evil, although it may hold out hope to the individual. The use of x-rays and radium will doubtless secure more and more relief in the future because it appeals more to the public, who seem unwilling to co-operate with the profession in a surgical crusade. Many sound thinkers are still hopeful of future benefits from dietetic and other medical procedures, especially in the direction of prevention. The parasitic theory, once quiescent, has now an increasing following.

CANDIA. See CRETE.

CAPE COLONY. See CAPE OF GOOD HOPE PROVINCE.

CAPE OF GOOD HOPE PROVINCE. One of the four original provinces formerly known as Cape Colony, the southernmost province of the Union of South Africa. Area, 276,966 square miles, with total population of 2,564,965; European or white, 582,377; colored, 1,982,588 (all these, census of 1911). In 1918 the European population was 619,319. There are the following divisions of the province: Bechuanaland, East Griqualand, Tembuland, Pondoland, Transkei, and Walfish Bay. The capital is Capetown, with a population in 1917 of 67,159, including the suburbs, 161,579. Other towns with their population in 1911 are: Kimberly, 29,525; Beaconsfield, 14,294; Port Elizabeth, 30,688; London, 20,867; Graham's Town, 13,830; Paarl, 11,018; Simonstown, 4751; Vryburg, 2461; Mafeking, 2296. The races are mainly Hottentots, Malays, Kaffirs, Fingoes, and Bechuanas. Malays numbered 19,763 and of the colored population 415,282 were of mixed races. Among the colored population the females outnumbered the males, but among the whites the reverse was true. The number of Christians was 1,437,688 according to the 1911 census. The churches were at that time, in the order of their numerical importance: Dutch, Congregational, and Anglican. The census also showed that 1,735,491 could neither read nor write. European children are required to attend school and the state has established (1918) 4888 state aided schools. The estimate of Provincial Expenditures for 1917-18 was £1,789,795, and the estimated revenue was £1,367,210. In 1918 (by provisional figures) the trade between the Cape of Good Hope Province and the United Kingdom was: Imports from Cape, £8,065,208; exports from U. K. to Cape—British produce and manu-

factures £10,251,287—foreign and colonial merchandise £310,815.

CAPE VERDE ISLANDS. A West African group of Portuguese islands, with a total area of 1516 square miles, with a population, according to the census of Dec. 31, 1912, of 149,793, of whom 4799 were white. The chief products are coffee, hides, medicinal plants, and millet. For revenue, expenditure, imports and exports, see preceding YEAR BOOK. The ports of the Archipelago were visited in 1916 by 7407 merchant vessels of 5,017,671 tons, besides the coasting trade. Capital, Praia.

CARINTHIA. Prior to the break-up of the Austro-Hungarian Empire, this country was a crownland and titular dukedom of Austria. It is bounded by Tirol on the west, Styria on the east, Salzburg and Styria on the north, and Venetia, Görz, and Carniola on the south, with an area of 3987 square miles. It had a population of 396,200 by the census of 1910, which was estimated at 406,162 in 1913. Of these 304,287 were German speaking and the majority have Catholicism as religion. The capital is Klagenfurt, with a population of 28,911 in 1910. Carinthia was formerly represented by 10 members in the lower house of the Austrian Parliament and was locally governed by a single chamber of 43 members. For further details based on the 1910 census, no later figures being obtainable, see preceding volumes of the YEAR BOOK.

CAPPIANI, LUISA. A German dramatic soprano and noted teacher, died at Zurich, September 27. She did not make her debut until after the death of her first husband, Gisbert Kapp, in 1859. In 1861 she sang Wagner rôles in Rotterdam. In the United States she appeared in 1867 as Mme. Kapp-Young. After several seasons in Italy she came back to this country, and established herself under the name of Cappiani as a teacher in Boston and New York. After 1899 she lived permanently in Milan. In 1884 she was one of the original founders of the American College of Musicians.

CARLISLE INDIAN SCHOOL. See INDIAN TRAINING AND INDUSTRIAL SCHOOL.

CARNEGIE, ANDREW. American financier and philanthropist, died of pneumonia at Shadow Brook near Lenox, Mass., on August 11. Though he had been for several years preceding in bad health which became worse during the past year, his death was unexpected. He was born at Dunfermline, Fifeshire, Scotland, Nov. 25, 1835, the son of a Scotch weaver. In 1848 when introduction of steam threw so many weavers out of employment the Carnegie family came to the United States and while still a boy he worked as weaver's assistant in a cotton factory in Allegheny, Pa. (1848). In 1851 he was a telegraph messenger boy in a Pittsburgh office; and having learned telegraphy entered the service of the Pennsylvania Railroad as telegraph operator, but advanced rapidly until he became superintendent of the Pittsburgh division. His first important financial interest was in the Woodruff Sleeping Car Company and he there laid the foundation of his fortune which by careful investment in oil lands was subsequently increased. During the Civil War he rendered excellent service to the War Department as superintendent of military railroads, and of government telegraph lines in the east. He began to see a great future for iron and steel and henceforth interested himself in the development of iron works of various

kinds, especially the Keystone Bridge Works at Pittsburgh and the Union Iron Works. In 1867 he visited England for the purpose of placing certain securities there and was successful, receiving a large commission. While there he studied carefully the making of steel and in 1868, having returned to the United States, he installed the Bessemer processes in his shops. He organized in Pittsburgh the firm of Carnegie, McCandless & Company. By 1874 the output and profits of his works were very large. In 1881 the firm was reorganized under the name of Carnegie Brothers and Company with a capital of \$5,000,000. He bought shares in the Homestead and Edgar Thomas steel works as well as in other large plants and became the principal owner a few years later. In 1888 besides being the principal owner of the Homestead Steel works he controlled seven other large steel plants. In 1899 he consolidated his interests in the Carnegie Steel Company, which in 1901 was merged in the United States Steel Corporation. Thereupon Mr. Carnegie retired from business and from that time on devoted himself to philanthropy. The price that he received upon the incorporation with the United States Steel Company was placed at \$460,000,000 and his annual income at that time was \$22,000,000. The value of his property since that date was said to have greatly increased. The most notable gift was that to libraries throughout the United States and Great Britain, the Carnegie library being a feature known throughout the entire country, as well as in Canada, New Zealand, and the United Kingdom. In 1918 his gifts in all were placed at over \$300,000,000, and at the time of death at \$400,000,000. The largest single gift was that of \$24,000,000 for the creation of the Carnegie Institute at Pittsburgh. Some of the other leading benefactions were as follows: \$22,000,000 to Carnegie Institution of Washington; \$10,000,000 to Scotch universities; \$5,200,000 to New York for branch libraries; \$5,000,000 to the Carnegie Hero Fund Commission, Pittsburgh; \$5,000,000 to funds for the benefit of the employees of the Carnegie Steel Company; \$1,500,000 for the Peace Temple at The Hague. His donations for libraries in 1918 had come to over \$60,000,000 for over 3000 municipal buildings; \$10,000,000 for the Carnegie endowment for international peace; \$16,250,000 for the foundation for the advancement of teaching in the United States, Canada, and Newfoundland. In 1912 he announced that his property with the exception of \$25,000,000 had all been turned over to the Carnegie Corporation, organized in New York on Nov. 10, 1911. His membership in societies, clubs, and the honors which he received makes too long a list to be given here. He was Lord Rector of Saint Andrew's University, Scotland, 1903-07, and Lord Rector of Aberdeen University, 1912-14. His publications include: *An American Four-in-Hand in Britain* (1883); *Round the World* (1884); *Triumphant Democracy* (1886); *The Gospel of Wealth* (1900); *Empire of Business* (1902); *James Watt* (1905); *Problems of To-day* (1909).

CARNEGIE ENDOWMENT FOR INTERNATIONAL PEACE. See INTERNATIONAL PEACE AND ARBITRATION.

CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING. See UNIVERSITIES AND COLLEGES.

CARNEGIE INSTITUTION OF WASH-

INGTON. The 1919 annual report of President Robert S. Woodward contains a summary of the activities of the institution during the year ending October 31st. When the armistice was signed the Institution was devoting about two-thirds of the staffs, some 200 men, to war work. Of the larger undertakings in this work, the most conspicuous were the development to the point of quantity production of the optical glass industry by the Geophysical Laboratory; the manufacture of precision micrometers for the U. S. Bureau of Standards and the manufacture of optical adjuncts for artillery by the staff of the Mount Wilson Observatory; the construction of special devices for the navy in the shops of the Department of Terrestrial Magnetism; the contributions of the Nutrition Laboratory to knowledge of the effects of undernutrition; and the information service rendered by the Department of Historical Research. This work continued until about the middle of 1919. Because of all this war work, the regular activities of the Institution have been somewhat neglected from lack of time and men, but now that the war is at a close they are being taken up again with renewed vigor. The Hooker telescope, the largest in the world, was completed just before the United States entered the war, but experiments have not been conducted with it until this year. As an engineering feat it was a hazardous undertaking, but the Director of the Observatory now reports that the optical and the engineering difficulties have been overcome and that the instrument under repeated tests has proved efficient quite beyond the conservative theoretical predictions of attainable capacities. On October 19th of this year, the non-magnetic ship *Carnegie* sailed from Virginia on her sixth cruise, to comprise surveys in the Atlantic and Indian Oceans not yet adequately covered by previous circuits. This ship had been in port during the war on account of the dangers of navigation.

During the year the Division of Publications issued 29 volumes. Among them the most important was the *History of the Theory of Numbers* by Prof. Leonard E. Dickson of the University of Chicago. Up to October 31st, Vol. I had been printed and Vol. II was in the press. Vol. I was devoted to divisibility and to primality of numbers. Vol. II will be devoted to diophantine analysis.

During the year several important men have been lost to the Institution by death, the most important being Mr. Andrew Carnegie who died on August 11th at Lenox, Mass. In his relations with the trustees of the Institution, Mr. Carnegie took a most liberal attitude, never seeking to dominate, or even to guide. Other recorded deaths are: Andrew D. White, eminent historian, and a trustee of the Institution; Theodore Roosevelt, a member of the Board of Trustees under the terms of the original charter, which gave to the Institution a quasi-governmental connection; John Coit Spooner, distinguished lawyer and ex-Senator, and another member of the Board of Trustees; and W. Max Muller, eminent orientalist and a Research Associate of the Institution since 1904. He was an indefatigable student of Egyptology and made three archaeological expeditions under the auspices of the Institution to that country.

The financial report shows total receipts during the year of \$1,532,028.53, and disbursements amounting to \$1,612,602.01. The receipts from

CARNIOLA. Formerly a titular dukedom and crownland of the kingdom of Austria, having Carinthia and Styria on the north, Styria and Croatia on the east, Görz and Gradisca on the west, and Croatia and Istria on the south. Area, 3842 square miles. The population according to the census of 1910 was 525,995, the largest part being German speaking and having Catholic religion. For further details based on 1910 census see preceding volumes of the YEAR BOOK, as there are no later figures available. Laibach is the capital, and had a population of 41,727 in 1910. Under the Empire Carniola was represented in the lower Austrian Parliament by 12 members and locally governed by a single chamber of 51 members.

CAROLINE ISLANDS. See GERMAN NEW GUINEA.

CARPENTER, ROLLA CLINTON. Civil engineer, died at Ithaca, N. Y., January 19. He was born at Orion, Michigan, June 26, 1852; studied at the Michigan Agricultural College, the University of Michigan and Cornell University. He entered the faculty of the Michigan Agricultural College in 1875 and was professor of experimental engineering at Cornell University from 1895 to 1917 after which he became professor emeritus. He was consulting engineer for a large number of important enterprises in different parts of the country. Among his writings may be mentioned the following: *Experimental Engineering* (8 edits., 1890, 1902); *Heating and Ventilating* (6 edits., 1898, 1910); *The Gas Engine* (with Professor Diedrichs); *Heating and Ventilation* (*New Internat. Ency.*, and Kidder's *Architectural Pocket Book*); numerous papers, translations, etc.

CARR, CLARK EZRA. Lawyer and diplomat, died at Peoria, Ill., February 28. He was born at Boston Corners, N. Y., May 30, 1836; studied at Knox College, Illinois, and at the Albany Law School in New York, and practiced law in Galesburg, Ill. During the Civil War he served on the staff of Governor Yates of Illinois. From 1889 to 1893 he was minister to Denmark. He was prominent as a spokesman for the Republican party in almost every political campaign after 1856 and was the author of the following books: *The Illini* (1904); *Lincoln at Gettysburg* (1906); *My Day and Generation* (1908); *The Railway Mail Service* (1909); *Life of Stephen A. Douglas* (1909); also magazine articles.

CARTER, FRANKLIN. Former president of Williams College, Mass., died at Williamstown, Mass., November 22. He was born at Waterbury, Conn., Sep. 30, 1837, studied at Yale and Williams, graduated at the latter in 1862; and subsequently studied at the University of Berlin. He was professor of Latin at Williams College, 1865-72; professor of German at Yale, 1872-81; became president of Williams College, 1881, holding that office for 10 years when he resigned. After 1896 he was president of the Clarke School for the Deaf. He was trustee of Williams College and other educational institutions, and an officer or member of important societies. He wrote a *Life of Mark Hopkins* (1882), and edited an edition of *Goethe's Iphigenie auf Tauris*.

CARUS, PAUL. Philosophical writer and editor, died at La Salle, Ill., February 11. He was a well known writer on a great variety of philosophical subjects. He was born at Ilsenburg, Germany, July 18, 1852, and was educated at the universities of Strassburg and Tübingen. He was editor of the *Open Court* and the *Monist*. Among his publications may be mentioned the following: *The Soul of Man* (1891); *Monism: Its Scope and Import* (1891); *Religion and Science* (1893); *The History of the Devil* (1900); *The Surd of Metaphysics* (1903); *The Story of Samson* (1907); *Foundations of Mathematics* (1908); *God* (1908); *Pleroma* (1909); *The Philosophy of Form* (1911); *The Mechanistic Principle of Relativity in the Light of the Philosophy of Modern Science* (1913); *Nietzsche and Other Exponents of Individualism* (1914); in addition to several works on Buddhism and Chinese philosophy, and *Truth and Other Poems and Night* (Dramatic Poem).

CASE SCHOOL OF APPLIED SCIENCE.

An engineering college at Cleveland, Ohio, giving courses in civil engineering, mechanical, electrical, mining, and chemical engineering, and physics. In the fall of 1919 there were 781 students and 62 members in the faculty. Productive funds for the year amounted to \$207,991. The library contained 13,981 volumes. Case was founded in 1881. President, Charles S. Howe, Ph.D., LL.D.

CATTLE. See LIVE STOCK; DAIRYING; VETERINARY MEDICINE, etc.

CAUCASUS. The isthmian region of southeastern Europe, separating the Black Sea and the Sea of Azov from the Caspian Sea. This region was formerly one of the general governments of Imperial Russia, with divisions into Ciscaucasia and Transcaucasia. The area is 181,173 square miles, and estimated population, Jan. 1, 1915, 13,299,100. For further information as to divisions of the country, and distribution of the population by color, race, etc., see preceding volumes of the YEAR BOOK.

CELEBES. See EXPLORATION.

CELEBRATIONS. The centenary of the death of James Watt was celebrated in Birmingham, England on September 16th, 17th, and 18th, and exercises commemorative of his invention of steam engines were arranged under the direction of a committee of which Sir David Brooks, Mayor of Birmingham, was chairman and consisting of official representatives from the universities of Belfast, Birmingham, Bristol, Cambridge, Durham, Edinburgh, Glasgow, Ireland, Leeds, Liverpool, London, Manchester, Sheffield, and St. Andrews, as well as numerous technical schools, various societies and learned institutions, and many prominent citizens, including the U. S. Ambassador.

The Commemoration began on September 16th with a service in the Handsworth Parish church (in which is the Chantry statue of James Watt), where the address was made by the Canon of Westminster; after which there was a garden party, a reception, and a lecture. On the morning of September 17th there were lectures dealing with the history and development of the application of science to industry and in the afternoon visits were made to the Watt engines at Ocker Hill and at Bordesley, while in the evening the Centenary Dinner was held. On September 18th visits were again made to see the Watt engines

and to the Soho Foundry, where some of the original buildings erected by Watt are still standing. Also a Degree Congregation was held at the University of Birmingham where degrees were conferred upon distinguished engineers and scientists. Excursions to places of historic interest, such as Stratford-on-Avon and Warwick were arranged for. During the Commemoration a large collection of Watt, Boulton, and Murdoch relics were on exhibition.

To commemorate the Centenary funds were solicited, 1, To endow a Professorship of Engineering, to be known as the James Watt Chair, at the University of Birmingham, for the promotion of Research in: "The fundamental principles underlying the production of Power, and the study of the conservation of the natural sources of energy." 2 To erect a James Watt Memorial Building, to serve as a museum for collecting together examples of the work of James Watt and his contemporaries, Boulton and Murdoch, illustrating this interesting epoch in the history of engineering, and 3, To publish a Memorial Volume.

Independence Day was celebrated in Washington, D. C., by seven pageants, showing the calls of art, of the land, of commerce, business and professions, of the children, of labor, of liberty, and to world service were given late on July 4th on the lawns of department and other public buildings. These pantomimes were merged into a great pageant entitled the "Offering of Peace," which showed the peoples of the world having passed through the horrors of war returning with courage and expectation to the pursuits of peace.

Victory pageants depicting war events were presented in various cities to serve as a stimulus to the Victory Loan campaign, and that given in New York on May 3rd, was especially noteworthy.

As the time for the Tercentenary of the landing of the Pilgrims of the *Mayflower* at Plymouth in 1620 approaches plans for its celebration are being prepared. In June a joint committee of two Senators and four representatives from Congress was appointed to confer with the Massachusetts State officials and it was directed to recommend legislation necessary for "participation by the government of the United States in the celebration of this historic event." Senator Harding of Ohio was made chairman of the committee.

The General Society of *Mayflower* Descendants is raising funds to purchase two corner lots at the end of Middle Street, Plymouth, Mass., to be added to the ancient burial ground on Cole's Hill. The contemplated purchase would give the society the ownership of the original graveyard, only a portion of which is now preserved. The property will provide sufficient room for an oval 100 by 40 feet, which will be inclosed by a stone coping and marked in the centre by a monument or boulder containing the names of the original settlers who died at Plymouth during the first Winter.

The New York State Society of *Mayflower* Descendants has appointed a committee which proposes to erect a suitable monument in New York City to commemorate the arrival of the *Mayflower* in the New World in 1620. It will be of bronze and stone and it is hoped that it will be completed and ready for dedication on the tercentenary date.

The National Society of the Colonial Dames of

America at their annual Council held in Washington, D. C., in May, 1919, pledged \$24,000 towards the erection of a granite memorial to be placed on a granite sea-wall, which it is proposed shall be built by this organization at a cost of about \$50,000.

In November the announcement was made that the Administrative Committee of the Federal Council of Churches of Christ in America had decided to name a special committee for the *Mayflower* Tercentenary to work in coöperation with the British Council's *Mayflower* Committee. They plan to hold great celebrations in Plymouth, in London, in Southampton, in Nottingham, in Northumberland, as well as in Amsterdam and Leyden, so that the delegates who come from America will be able to make a pilgrimage of the places associated with the story of the Pilgrims.

CELLERE, B. MACCHI DI. Italian diplomat, died at Washington, D. C., October 20. He had been Italian Ambassador to the United States since 1913. He was born in 1866 and served as private secretary to successive ministers in the Department of Foreign Affairs, and in 1904 was chargé at Washington. He was Minister to the Argentine Republic from 1907 to 1912. His death occurred suddenly as the result of an operation at the hospital.

CEMENT. Owing to war restrictions the production of cement in the United States during 1918 was the smallest recorded since 1909. The average factory price per barrel for Portland cement in 1918 was \$1.56, as against \$1.35 in 1917—an increase of 17.9 per cent.

Shipments of Portland cement in 1918 amounted to 70,915,508 barrels, valued at \$113,153,513, compared with 90,703,474 barrels, valued at \$122,775,088, in 1917, a decrease in quantity of 21.8 per cent and in value of 7.8 per cent. The production in 1918 was 71,081,663 barrels, compared with 92,814,202 barrels in 1917, a decrease of 23.4 per cent. Stocks at the mills increased from 10,353,838 barrels in 1917 to 10,453,950 barrels in 1918, an increase of 1 per cent.

Exports of hydraulic cement from the United States in 1918 totaled 2,252,446 barrels, valued at \$5,912,166, or \$2.62 per barrel, compared with 2,586,215 barrels, valued at \$5,328,536 or \$2.06 per barrel, in 1917. This was a decrease in quantity of 12.9 per cent and an increase in value of 11 per cent. Imports for consumption in 1918 were 305 barrels, valued at \$1200, or \$3.93 per barrel, compared with 2323 barrels, valued at \$6076, or \$2.62 per barrel, in 1917, representing a decrease in quantity of 86.9 per cent and in value of 80.3 per cent.

In the autumn of 1919 it was officially announced that in order to afford ample opportunity for mill adjustments the United States departmental cement committee had postponed the proposed increase in the fineness requirements for Portland cement until Jan. 1, 1921. At that time the government would require a 20 per cent residuum on the No. 200 sieve instead of the 22 per cent of the existing standard specification.

CENSUS, UNITED STATES. The law providing for the Fourteenth Census which was to be taken in 1920 was enacted on March 3, 1919. In respect to scope, methods, and administration it follows in the main the lines of the Thirteenth Census legislation. Among the most important new points in respect to scope the following may be mentioned: The date of the census was changed from April 15th to January 1st. The

© Underwood & Underwood

VICTORY ARCH ON FIFTH AVENUE, NEW YORK

minimum-size limit for cities in which enumeration must be completed within two weeks was changed from 5000 to 2500. Provision was made for the census of forestry and forest products; for information as to the encumbrances on homes and farms; for inquiry as to the sex of farm operators; for the amplification of the irrigation inquiry and the addition of a drainage inquiry; for mid-decennial censuses of agriculture to be taken in 1925 and at 10 year intervals thereafter; for biennial censuses of products of manufacturing industries, beginning in 1921. In 1919 the Census Bureau was active in preparing for the new census and took a number of important measures. Several meetings of the Joint Advisory Committee chosen from statistical and economic experts were held, and all phases of the census work were carefully considered by it. The general population schedule was completed and issued on June 9th and was in the course of the year distributed to the supervisors and enumerators. In general form it was similar to those used in the two last decennial censuses. In the census of Alaska the Bureau planned to cooperate with the Bureau of Education, and in the census of Guam, Samoa, and the Panama Canal Zone it acted in conference with officials of the War and Navy Departments. Plans were made for ascertaining the military and naval population through the War and Navy Departments. In like manner cooperation was assured with other departments of the government in the respective fields of inquiry, for the purpose of avoiding duplication of work.

The important questions to be asked of all persons according to the schedule issued in 1919 were as follows:

1. Age at last birthday
2. Each person ten years of age and over will be asked whether he is able to read or write.
3. Each person will be asked his birthplace as well as the birthplace of father and mother
4. If foreign born the date of coming to the United States will be asked, and, if naturalized, the date of becoming a citizen; also mother tongue or native language.
5. Each head of a family will be asked whether his home is owned by him or rented. If owned, whether the home is mortgaged or free of debt.
6. Each person will be asked his occupation and whether he is an employer or employee or is working on his own account.

Of farmers especially the following are among the important questions asked:

1. Each occupant of a farm will be asked how many years, if any, he worked on a farm for wages; how many years, if any, he was a tenant; and how many years, if any, he farmed as an owner
2. Whether he (a) owns, or (b) rents, or (c) partly owns and partly rents his farm, or whether (d) he operates the farm for others as a manager or superintendent.
3. How many acres in his farm? Number of improved acres? Number of unimproved acres and number of acres of woodland?
4. Total value of farm? Total value of buildings? Value of implements and machinery on farm?
5. Whether farm is mortgaged? If so, the amount of mortgage?
6. Expenses for feed, fertilizer, and labor in the year 1919?
7. Several questions concerning artificial drainage of his farm.
8. Number of cows, horses, sheep, chickens, and other domestic animals on the farm January 1, 1920?
9. Quantity and acreage of all crops grown on the farm in 1919, including fruits and vegetables?
10. Quantity of milk and butter sold off the farm during the year 1919?
11. Acreage of timber land on farm and value of forest products.

CENTRAL AMERICA. The territory including Guatemala, Honduras, Salvador, Nicara-

gua, Costa Rica, and British Honduras. The term sometimes includes also Panama. See these titles.

CENTRALIA DISTURBANCE. See INDUSTRIAL WORKERS OF THE WORLD.

CEYLON. An island in the Indian Ocean at the southern end of Hindustan constituting a British colony. Its extreme length from north to south is 376 miles, and extreme width 139 miles. Area, 25,481 square miles. Population, in 1911, 3,592,883; estimated, at the beginning of 1918, exclusive of the military and shipping, 4,632,400. The Maldivé islands which consist of a group of coral islets 400 miles to the west are tributary to the Ceylon government, and are governed by an elective Sultan. Their population is placed at 72,237. The population of Ceylon as distributed by race according to 1917 estimates is as follows: Singhalese, 2,951,100; Tamils, 1,388,100; non-Malay Mohammedans, 2,766,600; Burghers, 28,750; Malays, 14,000; Veddahs (aborigines) and others, 16,600; Europeans, excluding those absent for military duty, 7200. The marriage rate according to 1917 estimates was 11.87 per thousand, the birth rate 40.1, and the death rate 24.7. Distribution according to religions in 1917: Buddhists, 2,791,120; Hindus, 1,058,450; Mohammedans, 319,965; Christians, 461,584. The urban population was placed at 13 per cent of the total. The chief towns with their population according to the census of 1911 are: Colombo, 211,274; Galle, 39,960; Jaffna, 40,441; Kandy, 29,451. The government schools in 1917 numbered 817 with an attendance of 84,552 boys and 28,544 girls; aided schools 1835, with an attendance of 131,892 boys and 78,434 girls; unaided schools 1229 with an attendance of 24,864. In English and English-vernacular schools which numbered 332 there were 37,170 boys and 10,353 girls. Acreages under cocoanuts in 1917, 904,674; rice, 702,165; other grains, 133,028; tea, 508,779; rubber, 251,500; cinnamon, 39,930; cacao, 44,280. The chief mineral industry from the point of view of exportation is that of plumbago whose normal annual production is about 30,000 tons. In 1918 only about one-half of that quantity was produced owing chiefly to the loss of the American market during the latter half of the year. The United States took less than 55 per cent of the quantity as compared with 80 per cent in 1917. The mica industry was revived during 1918 and a beginning was made in the preparation of monazite. The figures for the overseas trade of Ceylon for 1913 to 1918 inclusive are as follows:

Year	Imports	Exports	Total trade
1913	\$60,368,312	\$75,588,731	\$135,957,043
1914	55,905,553	70,844,514	126,750,067
1915	53,089,540	88,692,283	141,781,823
1916	68,617,895	96,520,835	165,138,730
1917	59,735,959	98,679,791	158,415,750
1918	57,657,242	68,560,980	126,218,222

Of the total exports in 1918, \$64,118,794 represents the value of Ceylon produce and \$4,442,186 that of reexports. In the total of the Ceylon trade the British possessions had nearly 50 per cent. Of foreign countries importing from Ceylon Japan held front rank in 1918. The United States had only 11 per cent of Ceylon's trade as compared with 22 per cent in 1917. The imports from the United States include a larger amount of metals and metal ware than from any other importing country. In respect to exports, rubber

and tea made up 72 per cent of the value of Ceylon's exports in 1918 as compared with 76 per cent in 1917. In 1918 the export of rubber sank to a point lower than in any previous year after 1914. Restrictions imposed by the United States greatly cut down shipments to America, and the export to the United Kingdom was cut off on account of the removal of rubber from the priority list, and to the policy of the rubber companies in restricting the crops. The exportation of tea in 1918 was less than in any previous year after 1908. Coconuts, a staple product, also suffered as a result of war conditions. The total declared exports from Ceylon to the United States were considerably below those of any previous year after 1914, being valued at \$12,682,374. The imports from the United States were about the same in 1918 as in 1917, being in round numbers \$1,800,000.

Revenue (1916-17) £4,465,458; expenditure, £4,289,044. The public debt on Sept. 30, 1917, was £5,410,667.

Railways open for traffic on Sept. 30, 1918, 714; at that time several extensions were under construction. The post offices numbered 524, and the telegraph wire had a length of 6953 miles. The shipping entered and cleared in 1917 was 6,153,778 tons, of which 14,626,345 was British. Ceylon possessed a merchant marine on Jan. 1, 1918, of 137 sailing vessels and 8 steamers.

CHADWICK, FRENCH ENSOR. Rear-Admiral in the United States navy, died in New York City, January 27. He was born at Morgantown, W. Va., Feb. 29, 1844; graduated at Annapolis, 1864, and was on board the *Marblehead* when it pursued the Confederate steamships *Florida* and *Tallahassee*, 1864. He was in command of the *New York* and the chief of staff of Admiral Sampson during the war with Spain and took part in its most important naval engagements, and he was commander in chief of the South Atlantic Squadron in 1904. He rose to the rank of rear-admiral Oct. 11, 1903, and retired, Feb. 28, 1906. A list of his writings includes the following: *Temperament, Disease, and Health* (1892); *An Unsolved Problem* (1896); *Causes of the Civil War* (American Nation Series, Vol. XIX, 1906); *Relations of the United States and Spain, 1776-1898*; *Diplomacy* (Vol. I, 1909); and *Spanish-American War* (Vols. II and III, 1911); *The American Navy* (1915).

CHAMBER MUSIC. See MUSIC.

CHAMBER OF COMMERCE, RECONSTRUCTION PROGRAMME, see INDUSTRIAL RECONSTRUCTION.

CHARITIES. In the field of charitable endeavor the year has been marked by the sincere efforts of all agencies to readjust themselves and redirect their activities along peace lines. The signing of the armistice threw into confusion many plans and undertakings of the social organizations, and made radical readjustment necessary in almost the whole field. Particularly was this true of the special agencies created to meet the requirements of the war. See RED CROSS, WAR CAMP COMMUNITY SERVICE, Y. M. C. A., Y. W. C. A., ROCKEFELLER PHILANTHROPIC BOARDS, RELIEF FOR WAR VICTIMS, RUSSELL SAGE FOUNDATION.

Of the foregoing agencies, that which has been engaged most extensively in relief work with families in this country is the Red Cross in that branch of its activities known as Home Service. Soon after the outbreak of the war, it became

evident that some provision was necessary to help the families of men in the service with their unusual perplexities, such as difficulties of dealing with new and complicated governmental machinery, and delays incident to the system of allowances, allotments, compensation for injuries, and insurance granted to men in the service. A Bureau of Civilian Relief, formerly called into action only to cope with disasters, was quickly expanded to meet this need, and Home Service Sections composed of some paid and many voluntary workers, were established in connection with all the chapters as well as the majority of the branches, and were equipped to give information, sympathetic advice and direction, and relief of various kinds. Division offices were organized to help and supervise this work, and to train workers for the field. Nearly 4000 such Home Service Sections have been established with nearly 12,000 branches. The work was in the hands of 30,000 workers, of whom all but 2000 were volunteers. More than 1,000,000 different families have been reached by this organization since the war began, and the material relief disbursed by it to families of soldiers and sailors has averaged about \$500,000 a month.

The question of a peace-time programme for Home Service is still under discussion. The organization is opposed to duplication, and has signified its intention of withdrawing, when its work for men in service is at an end, from any community that is organized to carry on work for distressed families. This would mean ceasing to operate in most of the larger cities of the country, but would leave a very large field for its activities in the smaller towns and rural communities, many of which have for the first time experienced the benefits of intelligent social work directed toward the impecunious members of the community. In the larger communities as well, the effect of the Home Service work has often been to stimulate existing agencies for family social work to renewed activities.

Partly in response to the demand so created, the American Association for Organized Family Social Work (formerly the American Association for Organizing Charity) has extended its programme, and reorganized its staff to provide an Executive Department as a general suggestive help centre and means of inter-communication for member societies, and a Field Department which makes visits of organization, reorganization or consultation to such communities as need their services. It works in the closest cooperation with the division offices of the Red Cross. The Association is composed of 177 variously-named societies in as many different cities, which share the same general principles of doing case-work with families. They meet certain requirements such as employing at least one competent paid worker; their boards of management are open to all in the community regardless of sect; and they subscribe to the Transportation Agreement which prohibits the "passing on" of dependents from one community to another on which they have no claim. During the past year the Association assisted in the organization or reorganization of 13 societies for family social work, and made visits of consultation to 37 others, as well as carrying out two special community surveys. The total number of cities advised by correspondence was 288.

NATIONAL CONFERENCE OF SOCIAL WORK. The forty-sixth annual meeting of National Confer-

ence of Social Work was held this year at Atlantic City, June 1-8. This organization "exists to facilitate discussion of the problems and methods of practical human improvement, to increase the efficiency of agencies and institutions devoted to this cause and to disseminate information." In 1917 the name of the organization was changed from the National Conference of Charities and Correction to the present one. The organization has grown rapidly and the last meeting was marked by the largest attendance in the history of the conference, almost 5000 delegates being present. The conference is organized in 10 divisions: children; delinquents and correction; health; public agencies and institutions; the family; industrial and economic conditions; the local community; mental hygiene; organization of social forces; and the uniting of native and foreign born in America. General sessions were held each evening of the conference. At each of the sessions the work of one division was presented and discussed. Among the principal topics discussed were: a scientific basis of social work, a peace-time home service programme; the coöperative movement at home and abroad; provision for bringing the treatment of mental disease in civilian population up to the standards established in the army; the needs of industrial cripples; minimum standards of child welfare; standards of admission to day nurseries; standard methods in research surveys; case-work and industrial standards; effects of good standards in housing and recreation; a standard organization for community federation; health and the standard of living; elementary education; a living wage; rural communities; the negro problem; the immigrant problem; and European suffering.

Great interest was taken in the proposal "to request the President of the United States through the Secretary of the Interior or other cabinet official, to call a conference of national social and civil organizations to consider the correlation of efforts of those agencies and national budget planning (for the organizations concerned)." A Committee of Ten was finally appointed to execute this proposal. William J. Norton is chairman of the committee. A Committee of Twenty-one was also selected "to report on the advisability of a plan whereby the conference may give expression to standards and ideals." Otto W. Davis was made chairman of this committee.

During or preceding the Conference the following organizations held meetings: National Probation Association; National Conference of Jewish Charities; Conference of Foreign Community Workers, National Board; Y. W. C. A.; National Children's Home and Welfare Association; National Travelers' Aid Society; American Association of Hospital Social Workers; National Social Workers' Exchange; National Conference on the Education of Truant, Backward, Dependent, and Delinquent Children; New Jersey State Conference of Charities and Correction; National League on Unclean Conditions Among Negroes; National Conference of Catholic Charities; National Federation of Day Nurseries; Secretaries and Other Officers of State Conferences of Social Work; American Association of Officials of Charity and Correction; Home Service Workers, American Red Cross; Bureau of Information for Child Helping Societies; and the Inter-City Conference on Illegitimacy.

The divisions and chairmen of the Conference for 1920 are as follows: Children, Henry W. Thurston; delinquents and correction, Bernard Glueck; health, George J. Nelback; public agencies and institutions, Robert W. Kelso; the family, Amelia Sears; industrial and economic conditions, Florence Kelly; the local community, Howard S. Braucher; mental hygiene, C. Macfie Campbell; organization of social forces, William J. Norton; uniting of native and foreign born in America, Allen T. Burns. Owen R. Lovejoy was elected president of the organization for 1920. The annual meeting of the Conference will be held at New Orleans in 1920.

INSTRUCTION IN SOCIAL WORK. The problem of providing trained workers for the rapidly expanding needs of the social and charitable field has been extremely pressing for the last few years. To meet it, the existing Schools for Social Work have been extending their programmes and all report greatly increased enrollment. That at Richmond, Va., has doubled its attendance, has opened new departments of recreation, industrial service and community work, and is arranging for the first time to provide field work in the rural districts. The Chicago School of Civics and Philanthropy is specializing on Americanization and the Missouri School of Social Economy has added a course for the training of public health nurses. The Boston School of Social Workers has expanded its course on problems in industry and is requiring of all full-time students a new course on the principles of physical and mental health. The New York School of Social Work, whose registration of 92 includes 15 men, has added a department of mental hygiene and a vocational course in employment management. Many of the colleges and universities maintain special departments for the teaching of social work, some of them with a distinctly vocational aspect. New training centers of this description have been opened during the past year in connection with the Universities of Louisville, Rochester, Michigan, and Oregon. Thirty institutions of learning are cooperating with the Department of Training of the American Red Cross in conducting courses ranging in length from six weeks to a year. These include, in addition to the several institutions already mentioned, the Universities of Alabama, Washington, Nebraska, Wisconsin, Iowa, Indiana, Kentucky, Ohio, Colorado, Oklahoma, Missouri, Texas, Minnesota, New Mexico, Utah, Wyoming, Idaho, Arkansas, Tulane University, Emory University, Newcomb, Berea and Goucher College.

An Association of Training Schools for Social Work has been formed by the institutions which offer at least one full year's work. Jeffrey R. Brackett of Boston is chairman. During the coming year this association plans to study curricula, with object of recommending minimum standards for this kind of education.

CHASE, GEORGE COLBY. Educator, died May 27. From 1894 to the time of his death he was President of Bates College, Maine. He was born at Unity, Me., March 15, 1844; graduated at Bates College, 1868, and studied at Harvard and at University College, London. He was professor of rhetoric and English literature at Bates from 1872 to 1894 when he became President and professor of psychology and logic.

CHAUTAQUA INSTITUTION. Founded in 1874, this institution carried on its activities

under three general heads: (1) The public Assembly, with its educative though necessarily popular series of lectures and addresses, dramatic and other entertainments, concerts, etc., continuing through eight weeks each year. In the aggregate 50,000 persons attend annually. (2) The Summer Schools, offering formal classroom instruction in a great variety of subjects, under 13 departments, for six weeks annually, and enrolling over 3000 students. (3) The Home Reading work, presented in a set of four books and the news narrative appearing regularly in some weekly review, at present *The Independent*. The teaching element is supplied by a monthly bulletin, *The Round Table*. This department is operative throughout the year. Official enrollment is about 10,000, but readers are many more.

The forty-sixth Assembly was held beginning July 3, 1919, at Chautauqua, N. Y. A subject is taken for each week, and in 1919 the following topics were discussed by noted persons of this and other countries: "Women's After-War Problems," "Physical Efficiency and Public Health," "Music" (with many recitals), "Americanization," "The New Nations of Europe," and two weeks devoted to missionary subjects. The 1919 season was considered the most successful season in the history of the Institution. General attendance was 20 per cent above the best previous record, and registration in summer schools was 30 per cent above the largest former enrollment. During the summer a financial campaign under the name of the "Comprehensive Plan" was inaugurated with the aim to raise \$600,000 to clear the Institution from its indebtedness. Up to Sept. 1, 1919, \$415,000 had been raised, one-fifth of which was donated by Mr. John D. Rockefeller. It was expected that the rest of the amount would be raised before Jan. 1, 1920. Mr. Arthur E. Bestor is President of the Institution and Summer Schools. There are 89 members of the Summer Schools faculty. The headquarters of the Institution are at Chautauqua, N. Y.

CHEMICAL SOCIETY. See CHEMISTRY, INDUSTRIAL.

CHEMISTRY, GENERAL PROGRESS OF. The International Committee on Atomic Weights has made this year its first report since 1916. In reviewing the recent determinations the work of Guye's laboratory in Switzerland occupies a prominent place. Work of a very high order of accuracy has been done on the compounds of carbon and of bromine, only to confirm the present accepted values of their atomic weights. A new value for boron (10.9) has been placed in the table as a result of the work of Smith and van Haagen of the Carnegie Institution in Washington: a new value for argon (39.9) is based on Leduc's work in France, and 70.1 has been accepted for the atomic weight of gallium on account of the analysis of gallium chloride in the Harvard laboratories. Hönigschmid's ratios of silver to thorium bromide (reported in the *Zeitschrift für Elektrochemie*) have given 232.15 for the atomic weight of thorium; Hopkins and Balke have established 89.33 for that of yttrium from the ratio of oxide to chloride together with the analysis of yttrium chloride by Kremers and Hopkins. Other determinations made since 1916 are reviewed, but do not call for changes in the

table of atomic weights other than those noted above. In a study not yet considered by the Commission Hönigschmid has analyzed lead chloride from thorite, and obtained 207.90 for the atomic weight of lead, the highest value yet obtained. (See the YEAR BOOK for 1918.) He believes that an isotope of lead with an atomic weight 208.1 probably exists, and that the element thorium-D is not absolutely stable, but has a very long life. Hitherto no determinations of the atomic weight of scandium have been made by any other than the sulfate method. Hönigschmid has prepared the bromide of scandium by heating the oxide in a quartz tube with carbon in bromine vapor, and purified it by sublimation along the tube. Analysis of it by the Richards method gave 45.10 for its atomic weight, a whole unit higher than the value accepted in the table.

During the year several chemists of note have been taken by death. Among these should be mentioned John William Strutt (Baron Rayleigh), the discoverer of argon. His long scientific life was one of great productiveness in research, the merit of which was acknowledged by professional societies in this and other countries in their desire to award him medals, offices and honorary memberships. Of equal distinction in his field was Emil Fischer, professor of chemistry in the University of Berlin, and a world authority in organic and biological chemistry. His research work in these fields places him among the really great chemists of all time. Few indeed have contributed so largely to science, both by his own efforts in the laboratory and by the work done under his direction. Both of these men have been awarded the Nobel prize for science, the former in 1904, the latter in 1902.

The most striking papers in physical chemistry appearing during the year are without doubt those of Dr. Irving Langmuir on the arrangement of electrons in atoms and molecules, together with the brilliant conclusions drawn from his novel theory. Rejecting the current idea (based on physical evidence) of the motion of electrons in an atomic structure modeled like the planetary system, he assumes that the electrons in the elementary atoms are stationary, or at least that they are contained within a certain "cell" which is a part of the structure of the atom. Eleven postulates are stated and supported by data drawn from wide sources. These postulates are to the effect that electrons in the atoms of inert gases are arranged in pairs symmetrically placed with respect to a plane passed through the nucleus (equatorial plane); they are symmetrical with respect to a polar axis perpendicular to the plane and passing through the nucleus; they have four secondary planes of symmetry making angles of 45 degrees with each other so that the symmetry corresponds to that of a tetragonal crystal. Since the electrons occur in pairs symmetrical to the equatorial plane, there are no electrons in this plane. The electrons in any given atom are distributed through a series of concentric shells of equal thickness, the mean radii of the shells forming a series 1, 2, 3, 4, and the effective areas are 1:22:32:42. Each cell is divided into cellular spaces occupying equal areas in the respective shells and distributed over the surface of the shells in such a way as to allow the symmetry demanded in the first postulate. The first shell then contains 2 cells, the second 8, the third 18 and the fourth 32. Each of the cells in the first shell can contain only one elec-

tron, but the cells in the other shells can contain either one or two, provided all the inner shells contain the full quota of electrons before any occupy positions in an outer shell, and provided that there is an electron in every cell in this outside layer before any cell contains two electrons. The two electrons in any cell do not repel each other with strong forces, probably because there is a magnetic attraction which counteracts the electrostatic repulsion, as suggested in the Parson magneton theory of a few years ago. The remaining postulates have to do with the arrangement of the electrons in the outside (incomplete) shell of the atoms, since it is these electrons which determine the properties and behavior of the various atoms toward one another. When the number of outside electrons is small their arrangement is determined by the magnetic attractions beneath them, but as the number increases, especially when the outer shell is nearly completed, the electrostatic repulsion of the underlying electrons and those in the outside shell become predominant in determining the positions. The chemical behavior of an element is conditioned by its tendency to share pairs of electrons with other atoms, whereby the octet (somewhat crudely represented by the corners of a cube) arrangement for each atom is completed. Lithium, for example, contains only one electron in its outside shell, and it would be impossible or very difficult for it to acquire seven more electrons from another source, since this would make it correspond to a negative ion with seven charges. It easily gives up its single electron (for example to complete the octet arrangement in an element like fluorine whose outside shell already contains seven electrons) and thus becomes a positive ion on account of the charge of its nucleus. Fluorine, on the other hand, since it has seven electrons in the outer shell and strives to complete its octet arrangement by acquiring another electron, does not lose electrons from its shell (is never electropositive). By gaining an electron it assumes the octet arrangement in the stable (non-reactive) element neon. Similarly sodium, which has one more electron in the outer shell than neon, readily gives up this electron and reverts to the neon type. Thus the most stable arrangement of electrons is the octet, and other arrangements tend to assume this form by sharing their electrons in order to complete one octet or both of them, and in organic compounds the number of pairs of electrons shared by two octets corresponds to the usual valence of the element. In inorganic compounds the valence is not in general equal to the number of pairs of electrons shared by two octets. Some remarkable physical similarities are noted in the properties of substances not chemically related but which have similar arrangements of electrons in their molecules. For example, nitrogen and carbon monoxide have the same electron arrangement, and the physical properties of these two gases are practically identical; the same is true of carbon dioxide and nitrous oxide (laughing gas), though no chemical analogy is apparent without this ingenious theory of atomic structure. Such compounds are called "isosteric," and the term is applicable to radicals or groups of atoms as well as to molecules, though isosteric groups are not necessarily chemically similar. For example, sodium ions and neon atoms are isosteric, but have no physical or chemical similarity. Another type of relation-

ship may be illustrated as follows: argon and nitrogen gases resemble each other closely and argon is isosteric with chloride ion; hence cyanogen ion, which is isosteric with nitrogen, should resemble closely chloride ion. In fact the properties of the two classes of salts are very similar. It is impossible to go further into the consequences of the bold hypotheses advanced by Langmuir on account of limited space, but it may be said that this series of papers constitutes one of the most notable contributions to physical science for many years; the fruitfulness of the ideas is only just beginning.

W. A. Noyes, in his address accepting the Willard Gibbs Medal awarded him for distinguished work in science, reviewed the conceptions of valence which chemists have held since the nineteenth century, and advances the theory that a valence bond consists of an electron from one of two electrically neutral atoms rotating around two positive nuclei located in some part of the two atoms. He shows from a calculation of the known volume of sodium atoms that the kinetic theory would lead us to expect an orbital rotation of an electron during a period of the same order of magnitude as the vibrations which produce the sodium line in the spectrum. He considers, from this and other evidence, that it is more probable that atoms contain rotating electrons than that the electrons are in a static condition. The fact that halogens are sometimes positive and sometimes negative and that the oxygen atom of amine oxides is partly positive also points to a transfer of electrons which takes place in some other manner than that supposed by Langmuir and G. N. Lewis. His views are thus quite opposed to those set out in the preceding paragraph, and it is therefore evident that the matter of atomic structure is by no means near a settled question.

An ingenious adaptation of the thermionic amplifier used in radiotelegraphy has been made by Hall and Adams, who insert the instrument in the position usually taken by the telephone in ordinary determinations of electrical conductance. The instrument, which acts as a relay in that variations in one circuit set up amplified variations in another circuit coupled unilaterally with it, enables the audibility current to be greatly reduced, thus decreasing the possibility of polarization in the cell by current passing in it. With this arrangement it is possible to reduce the current to about 1 per cent of that usually employed, or to use frequencies beyond the limit of the human ear if desired.

There is a great and increasing tendency toward the adoption of physical methods in chemical analysis. The most striking development of the year is A. W. Hull's method by which a chemical analysis can be made on a cubic millimeter of material in powdered form. The substance is placed in a glass tube in the path of a beam of X-rays directed toward a photographic plate which records the diffraction pattern after an exposure of about an hour. The only apparatus required is a source of voltage, an X-ray tube and a photographic film. The method differs from other known methods of analysis by means of X rays in that the elements in the first row of the periodic table (that is, the lightest elements) may also be determined. After the film has been developed it shows, in addition to the overexposed beam in the centre, a series of lines caused by the reflection of the rays from the

tiny crystals of the powder. Their distances from the centre of the film depend on the spacing of the planes of atoms in the crystal, and there is one line for every important plane in every kind of crystal. Substances of different crystalline form will therefore exhibit entirely different patterns; substances similar in chemical nature will in general have similar crystal structure and give similar patterns, the one being simply a magnified image of the other. The magnification, or spread of the pattern, is inversely proportional to the cube root of the molecular volume of the substance causing the reflection. Since no two substances have exactly the same molecular volume, it is easy to distinguish between those with closely agreeing volumes, as the difference is cumulative for lines far from the centre of the plate. A further distinguishing mark is the relative intensity of the various lines, which differs greatly even in the most closely related compounds. The method is able to go a step farther than chemical analysis in that it shows beyond any question the nature of the combinations existing between the various elements as well as the elements present. The nature of the combinations in a mixture such as the ordinary sodium fluoride of commerce is clearly shown by the use of this method, which establishes the presence of the acid fluoride NaHF_2 , as well as the substance ordinarily designated by the symbols NaF . By narrowing the slits used to direct the beam of X-rays and using a smaller tube of the test material very sharp lines can be obtained in the photographs, and thus a mixture of several substances analyzed without ambiguity. Furthermore, by excessively long exposures (so as to greatly overexpose the principal lines) the presence of impurities in exceedingly small amounts can be established. As the material is not altered in any way by the passage of the X-rays, it is still available for any special tests desired after the analysis of it has been made.

A method for determining large or small quantities of iron has been devised by Hostetter and Roberts. They titrated the ferrous iron (after suitable reduction if necessary) with a very dilute dichromate solution and established the end point by the change of potential of a small platinum electrode dipping into the solution. If it was desired to estimate both ferrous and ferric iron in the same sample, the former was titrated in the usual way, then the total iron was reduced, again with electrometric control so that no excess of reducing agent was added. The presence of large quantities of acid in the solution was without effect on the sensitiveness of the method, and the salts accumulating in the course of an analysis were also without influence. Since hydrogen fluoride does not interfere, it was easy to determine both ferrous and ferric iron in a silicate in less than half an hour. Those familiar with the ordinary procedure for iron in both stages of oxidation will readily appreciate the usefulness of such a method. The precision of the method is equal to that of the best gravimetric work, the quantity of iron present may be as small as 0.28 milligrams or as large as that in a sample of pure iron. For the analysis of materials such as those required for optical glass, where the quantity of iron present is about a thousandth of 1 per cent, Hostetter has devised a method based on the color of ferric chloride in acid solutions, since as little as 0.02 milligrams of iron will give a perceptible

color to 50 cubic centimeters of 20 per cent hydrochloric acid. The method is not one of a high percentage accuracy, but is admirably adapted to the approximate determination of small quantities of iron, for example the impurities in high grade chemicals. When the quantity of iron is too large for this method, the electrometric one is applicable.

W. H. Perkin in England has extended his work on the structure of the alkaloids harmine and harmaline. He finds that the former assumption of a fused-ring system comprising a benzol, pyrrole and pyridine nucleus is not satisfactory, and reports a new series of experiments which shows that harmine is not a derivative of quinoline or iso-quinoline. Bearing in mind the formation of nitroanisic acid from harmaline, and that in the ring system the order of fusion is benzene-pyrrole-pyridine, two structural formulas are given with the methyl group in the pyridine nucleus, between which it is not possible to choose definitely. He has also published an investigation of cryptopine and its derivatives.

Kehrmann has taken up the study of diphenyl-dihydroacridine in an effort to establish the hypothesis of hexavalent carbon. This substance and its amino derivatives possess the character of leuco-derivatives, and is similar in structure to thiodiphenylamine. It gives on oxidation a new and interesting class of highly colored substances containing a chromogen analogous to phenylphenazonium. Structural formulas are given in which a hexavalent carbon atom is present. Unfortunately only a brief abstract in *Archives de science physique et naturelle* is available in this country, and details are therefore lacking.

Michael has continued his work on the relation between the chemical structure of organic compounds and their reactivities. Reactivity and instability are sharply differentiated, since the latter is due to incomplete neutralization of the atomic forces in the molecule, i.e., incomplete conversion of their free energies into bound energy, and should apply only to the behavior of a compound toward physical forces acting separately or simultaneously. Reactivity refers to the behavior of a certain atom or group of atoms in a given chemical system. It is the result of the sum total of changes in both free and bound chemical energy in all the atoms of a system which manifests itself at a certain atom or group. Many experiments have been performed on the reaction between carbonyl derivatives and semicarbazide, with the object of arranging the carbonyl compounds in the order of their reactivity toward the chosen reagent. The affinity constants in water and in alcohol were not the same, and he concludes that it is quite as unjustified to attach an absolute relative value to the reactivity of a ketone as to the affinity constant of an organic acid; in each case we should refer to a value in a given physical and chemical system. There is no connection between reactivity and velocity of reaction in the cases studied; velocity and reactivity are distinct relations which should invariably be distinguished between in organic investigations.

CHEMISTRY, INDUSTRIAL. The dominant feature in this year's progress in Industrial Chemistry seems to be readjustment or the resumption of pre-war conditions improved however locally by a greater knowledge of the

methods followed in other places, the result of intensified study of practices made necessary by the demands of the World War. This is conspicuously the situation in such industries as those pertaining to certain metals, dyestuffs, and potassium salts.

ORGANIZATIONS. The American Chemical Society held its spring meeting in Buffalo, N. Y., during April 8-11. The annual meeting was held in Philadelphia, Pa., during September 2-6. Membership has increased until it now exceeds 14,000 persons, William H. Nichols of the General Chemical Company was continued as president during the year. The American Electrochemical Society held its spring meeting in New York City during April 3-5, when the membership was reported as 1928. Wilder D. Bancroft was chosen president. Its 36th general meeting was held in Chicago, Ill., during September 23-26. The American Institute of Chemical Engineers met in Chicago, Ill., during January 15-18, and again in Boston, Mass., during June 18-21. Arthur D. Little was president for the year.

The Society of Chemical Industry held its 38th meeting in Mansion House, London, England, under the Presidency of Henry Louis. The membership increased during the year from 4429 to 5263. The Society lost in 1919 two of its most prominent past presidents by the deaths of Sir William Crookes (1913) and Sir Boverton Redwood (1907-08) both of whom were great leaders. There were important conferences at the annual meeting on Inter-allied Chemical Federation, on Power Plant in Chemical Works, on the Production and Consumption of Sugar within the British Empire, on Dyestuffs, Synthetic Drugs, and Associated Products, on the Chrome Tanning Industry, and on Recent Developments in the Fermentation Industries.

INTERNATIONAL ORGANIZATIONS Under the auspices of the Canadian Section of the Society of Chemical Industry, a number of chemists employed in industries, chemical engineers, research chemists, and chemists engaged in educational institutions from various parts of the Dominion met in Montreal on May 15-17 and organized the Canadian Institute of Chemistry. The Chairman of the Convention was Prof. W. L. Goodwin of Queen's University, and at a meeting held on May 21st, Prof. J. Watson Bain of the University of Toronto was chosen president.

Prior to the World War there had existed an International Chemical Council which had included representatives of the Central Empires but it had ceased to exist owing to the fact that while "German science will continue to function, the barbarous aid which it gave to the enemy armies during the war is sufficient to debar it forever from a confederation where science is to serve the progress of humanity." Accordingly in London on April 18th, an International Chemical Council was provisionally organized to cover the whole field of chemistry, including both technological and non-technological chemistry. This was followed by an Interallied Chemical Conference in Paris at which there were delegates from Belgium, France, Great Britain, Italy, and the United States out of which grew in turn at a meeting held in London during July 14-18 an International Union of Pure and Applied Chemistry and of which M. Moureu became president and M. Jean Girard,

secretary. Subsequently at a meeting of the International Research Council held in Brussels on July 22, the International Union of Pure and Applied Chemistry became officially the Chemical Section of the International Research Union. The next meeting of the Chemical Union will be held in Italy during the first two weeks of June, 1920.

NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES. During the week of September 22-27 there was held in the Coliseum and the First Regiment Armory in Chicago, Ill., the fifth National Exposition of Chemical Industries. According to the *Journal of Industrial and Engineering Chemistry*, the exposition "was a tremendous success: new materials, new products, new processes, new apparatus, and new machinery—to tell of it all would be the full story of American Success, not only in its declaration, but more still of its industrial independence." At the same time as the exposition was held there were meetings of the American Institute of Mining and Metallurgical Engineers, the American Ceramic Society, the American Electrochemical Society, and the Technical Association of the Pulp and Paper Industry. The exposition itself was formally opened on the evening of September 22 with addresses by Governor Lowden of Illinois, by Dr. Charles H. Herty, Chairman of the Advisory Committee, and one by John W. O'Leary on "The Relation of the Chemist to the Manufacturer." On September 22 there was a symposium on America's Case in Chemistry, and on the day following the principal sessions of the American Electrochemical Society were held. These were continued on September 25th when there was also a Symposium on Catalysis and a Symposium on Pyrometry. On the 26th the meetings of the various societies were continued, and on the 27th, in addition to meetings of the visiting organizations, there was a Symposium on Safety in Plant and Mine. Throughout the week motion-pictures, illustrating technical processes, were shown, and also there were official visits of inspection to the exhibits and many excursions to industrial plants and historical places in the vicinity of Chicago.

RELATIONS OF CHEMISTRY TO THE UNITED STATES GOVERNMENT. The Chemical Warfare Service described quite fully in the Year Book for 1918 (p. 124) will continue in active operation according to law until 1920. Meanwhile with the beginning of the year came the gradual demobilization of the many chemical experts who from various colleges and elsewhere, had entered the service for the period of the war and the special laboratory work on the manufacture of gases carried on at the American University near Washington, was, by the end of the year, entirely transferred to Edgemoor Arsenal, Md. Under the title of "The Research Division, Chemical Warfare Service, U. S. A." a very complete description of the work is given by Col. George A. Burrell who had charge of the Division. See also *Production of Gas Defense Equipment for the Army*,² by Col. Bradley, *The Development Division, Chemical Warfare Service*,³ by F. M. Dorsey, and *The Manufacture of War Gases in Germany*, by James F. Norris.⁴

¹ *Journal of Industrial and Engineering Chemistry*, vol. xi, p. 93, February, 1919.

² *Idem*, vol. xi, p. 185, March, 1919.

³ *Idem*, vol. xi, p. 281, April, 1919.

⁴ *Idem*, vol. xi, p. 817, September, 1919.

Other relations gradually diminished their activities until by the close of the year their work became practically negligible so far as this article is concerned.

Of more practical importance is the Chemical Foundation Inc. Under the foregoing name there was organized early in the year a corporation of which Francis P. Garvin became president, and which purchased under authority of an executive order signed by the President of the United States 4500 German patents from the Alien Property Custodian. In turn it was authorized to grant non-exclusive licenses to any American citizen or corporation in which 75 per cent of the stock is owned by American citizens. The charter provides that all profits over and above a small fixed return to the holders of stock shall be devoted to the advancement of the interest of chemistry and the allied sciences in the useful arts and manufactures of the United States. The capital stock of \$500,000 was issued as \$400,000 of 6 per cent cumulative preferred, to be retired from surplus income and \$100,000 of common stock limited to 6 per cent dividends.

MEDALS. On January 17th the Perkin Medal of the Society of Chemical Industry was presented to Dr. Frederick Gardner Cortrell of the Bureau of Mines for brilliant and useful research and development work in bringing about the practical and successful commercial operation of his method for smoke, fume, and dust abatement. The Willard Gibbs medal of the Chicago Section of the American Chemical Society was on September 26th conferred on Prof. William A. Noyes of the University of Illinois in recognition of his investigation on atomic energy.

EDUCATIONAL. Announcement was made in May by the vice-chancellor of the contribution of over \$1,000,000 by British oil interests for the endowment of a chemical school at Cambridge University, England. It is hoped that this endowment will permit the maintenance of a school of chemistry at that university that will be the foremost in Europe. The organization is in charge of Prof. Sir William J. Pope.

NATIONAL INSTITUTE FOR DRUG RESEARCH. Plans for founding at a cost of \$10,000,000 a national institute for drug research were presented early in the year by Dr. Charles H. Herty, the institute to have as its main object the study and preparation of such chemical compounds as are used in medicine with a view of definitely and positively passing on their merits. Until the World War, the United States has been dependent upon Germany for its synthetic medical compounds and it was urged that the time was opportune for the founding of such an institution. The plan received nation-wide endorsement from chemists, pharmacologists, and manufacturers, but as yet the foundation has not received the necessary funds with which to organize.

METALS, ALUMINUM. Owing to the fact that this metal is an easy one to work there has been an increased output of aluminum hollow ware in Birmingham, England, the chief centre of the industry in the United Kingdom. Machine processes are said to be displacing hand labor to a considerable extent in the factories devoted to hollow ware; stamping-presses are being used where the spinning lathe was formerly relied upon. The economizing of costs by standardizing models and a nearer approach to mass pro-

duction is giving a notable impetus to the industry. Prior to the war the Germans held a dominating position in the trade, nine-tenths of the imports coming from Germany, and it was estimated that the Germans were doing nearly three-fourths of the business in Great Britain. Strenuous efforts are being made by British manufacturers to supply the goods which were formerly brought from abroad. A modern factory has been established at Wolverhampton and several new enterprises have been started. In January there came a report that Norwegian electrotechnical factories had succeeded in economically extracting aluminum from Labradorite, a mineral that is found in great quantities in the western part of Norway. A new process for soldering aluminum is reported to have been invented by Charles Bingelli of Berne, Switzerland. A new metal called conducting aluminum has been invented by Dr. Georges Giulini. It is produced by putting ordinary aluminum through a patented process, by which it acquires the same mechanical qualities and capacities as bronze, copper, and brass without changing its specific weight. The fact that the new metal is a conductor will make it especially in demand in the electrical trade. The inventor anticipates for it also a market among builders of motor cars, aeroplanes, ships, and railway carriages.

MOLYBDENUM. The special and unique qualities possessed by molybdenum for the production of guns of large calibre and rifle barrels caused a sudden and imperative demand for the ore of this metal during the war. This resulted in the opening up of a number of new deposits, one of the most important of which is located in Canada. It is questionable whether the peace requirements are sufficient to justify developing other deposits until a more definite knowledge as to the normal demand is obtained.

PLATINUM. The diminished output of platinum from the Urals in Russia, due largely to the exhaustion of the deposits, has called attention more conspicuously to the Choco districts of Colombia which are still in their infancy. The war having ended, it would seem that the requirement of platinum in the manufacture of fuming sulphuric acid would be considerably reduced, but such is not the case with regard to its use with gasoline engines. There are many new uses: as a "catalyzer" platinum and its allied metal, osmium, are required in the production of ammonia from atmospheric nitrogen, to convert which into nitric acid heated platinum is also required.

TIN. With the close of the war came a declination in the demand for tin and the production from Yunnan in South China fell from 12,000 tons to 2500 tons so that the industry in that country has practically collapsed. In Siamese Malaya the production of tin ore has not been disturbed and the output is estimated to be about 1000 tons a month.

TUNGSTEN. During the war the production of tungsten ores and molybdenite throughout the world increased enormously but since the armistice, the demand has decreased. Stocks in the United Kingdom and those now on the way are more than enough to meet the requirements until 1921. Consequently the Minister of Munitions decided to terminate existing purchasing arrangements and declined to accept any deliveries of tungsten ores or molybdenite after April 30. With special regard to the South China de-

posits, while the shipments have decreased and reduction plants were closed up still it is believed that when conditions are adjusted this source will resume its activity and shipments to the United States will be resumed where it is used in the manufacture of steel for high-speed machine tools. Prior to the war the extraction of the metal from its ore was exclusively a German industry. Similarly in Portugal also during the war the selling price of tungsten ore increased from \$300-\$450 a ton to \$800 and even \$1500 a ton, but with the coming of peace the demand ceased and the industry has become dormant.

IRON. The British Minister of Munitions appointed a commission to visit the steel works in the districts of Lorraine and the Saar Valley during the spring. They reported that the various plants were worked at high pressure throughout the war, and the number of men employed was generally greater than before or after hostilities. In Lorraine, the iron and steel works suffered severely from shortage of fuel, especially during the later period of the war. Many times the blast furnaces were damped down and the steel works closed entirely for several weeks, owing to the inability of the Germans to send the coal and furnace coke required. Some of the French-owned works in Lorraine were kept at work by the Germans; others just within the French border had been idle since the beginning of the war, although the Germans made an effort to restart them. They apparently gave up the attempt, stole from the French works the bulk of the plant, tools, buildings, and stores, and destroyed the remainder. The stolen plant, etc., was installed in German-owned works in Lorraine. There was a shortage of manganese during the later period of the war, and as a substitute calcium carbide was tried with reduced quantities of manganese; but in the opinion of the committee the results were unsatisfactory as about 30 per cent of the steel so produced was scrap. The damage from bombing was slight and did not exceed \$25,000 in value. According to the report it would appear that France's acquisition of further supplies of ore will enable it to develop its future trade at the expense of Germany. It should be able to produce about 11,000,000 tons of pig iron a year with an equivalent in steel, to dispose of in competition with other countries. Before the war the resources of Germany of iron ore were approximately 3,600,000,000 tons, and those of France 3,300,000,000. The relative positions after the war are approximately, Germany, 1,300,000,000 tons and France 5,500,000,000 tons. The annual production before the war (1913) was Germany 27,000,000 tons and France 21,000,000 tons. The estimated annual production after the war is Germany 7,000,000 tons and France 12,000,000 tons. It would appear that except from France, Germany can only expect to obtain ore from Sweden or Spain, but as both these countries are actively developing their own steel industries they will probably not have much to spare. France's pre-war production was about 40,000,000 tons of coal, but its consumption was about 60,000,000 tons, the additional 20,000,000 tons being obtained from Great Britain, Belgium, and Germany. The control by France of the coal in the Saar Valley area is estimated to enable it to produce twice the tonnage formerly obtained from the Valenciennes

district. Before the war the Saar coal fields produced 17,000,000 tons annually. So that if the fuel conditions can be met satisfactorily the other difficulties will be easily overcome.

ALLOYS. A new bronze alloy, called M. bronze, which is particularly adapted for bearings, armaments, and machinery parts where a comparatively high hardness is required, and for welding and rolling has been invented in Norway. In order to satisfy different requirements the bronze is worked out in three qualities: One hard, one medium hard, and one soft. For use where an especially good quality is demanded and for ships' use there can also be produced a finer quality, like mangan bronze.

POTASSIUM. The condition of the potash industry was discussed in the YEAR BOOK for 1918 (p. 125) and outlines given of the various processes used in the United States for the production of salts of this alkali, so necessary in chemical industries. In April at the time of the Buffalo meeting of the American Chemical Society, it was said that no potash would be needed from Germany this year, and there were approximately 100,000 tons of that chemical in storage in the United States. This supply came from mines in Nebraska which had been under development for some time, and also from California. With the cession of Alsace-Lorraine to France, Germany loses the rich potash deposits of Alsace, and with them the potash monopoly of the world. The potash deposits extend 9.94 miles to the north of Muhlhausen, over a surface of more than 69.2 square miles. They are unusually rich in potash salts, much richer than the beds in the interior of Germany. They are, moreover, easier to exploit. Their thickness ranges from 12.1 to 17.7 feet. The thickness of the smaller beds in the upper layers varies from 2.6 to 4.9 feet. The first workings were begun in 1909, and in 1913 there were 12 in operation. In a period of three years the production rose from 42,420 to 287,000 metric tons, so that the production of potash in Alsace in 1913 was already one-fifth of the entire German output. The total capital invested in the potash works of Alsace amounted to \$8,187,200 at normal exchange. According to estimates made by Dr. Paul Kessler, the quantity of potash salts in Alsace amounts to nearly 1,500,000,000 metric tons, from which several hundred million tons of pure potash can be extracted. Before the war Germany exported potash salts to the value of \$23,800,000 at normal exchange. Notwithstanding this great loss the Germans were prompt in their reorganization, and a new potash law went into effect on Apr. 24, 1919. It is designed to socialize the potash industry by giving the workers a larger share in its management and profits, and by unifying its activities under government control. The provisions of the new law, which supersedes the Potash Law of 1910, vest the control of the entire potash industry in a State Potash Board. This board is composed of eight members representing employees of potash mines and factories, eight representatives of owners of such mines and factories, and 14 representatives of various other phases of the industry, including consumers, dealers, and technical experts. Italy formerly imported all her potassium salts from Germany but seeking economic independence appointed a commission to study as possible sources of potassium compounds, the

mother waters of the Italian and African salt mines and the leucitic rocks in which the central and southern parts of the peninsula are so rich. The potash beds of Catalonia, Spain, concerning which see the YEAR BOOK for 1915 (p. 132) were by royal order opened to bids for concessions in December, 1918 and in March announcement was made of the successful applicants, three in number.

SODIUM. An interesting effect of the World War is shown in the demands for caustic soda, which was used in gas masks to neutralize chlorine gas, and in consequence so pressing has been the need for this chemical in the war industries that its manufacture in the United States has doubled since 1914, and it even became necessary for a time to forbid its export. This led to the erection of a number of new plants in South America, especially in Brazil where three new concerns are now able to supply the home demands.

HELIUM. Information concerning helium, a non-inflammable balloon gas became available early in the year. According to Franklin D. Roosevelt, Assistant Secretary of the Navy. "If the war had lasted until spring, the British and American governments would have sent helium-filled rigid airships over strategic points in Germany, each capable of dropping a total of 10 tons or more of high explosives, either in a single tremendous discharge or in a number of smaller ones during its passage over a fortress or city. These airships would have carried batteries amply sufficient to repel airplane attack." It may be added that concerning the production of helium in quantity, two main problems were obvious. First, to develop methods of extracting helium from the natural gas; and, second, to determine the geologic occurrence of the gas, and so to locate adequate supplies. These problems were successfully solved by American experts, and although quantity production of helium was achieved just too late to be of value in actual hostilities, it was in itself a great accomplishment, for the world's total output of helium up to 1915 was probably less than 100 cubic feet, the market value of which was about \$1700 a cubic foot. Helium can now be produced in the United States by methods worked out by the military departments at less than 10 cents a cubic foot, and if later investigations fulfill expectations this figure will be still further reduced. See *Bibliography of Helium Literature* by E. R. Weaver¹

NITROGEN. Subsequent to the coming of peace the several plants (see YEAR BOOK for 1918, p. 125) erected by the government for the extraction of nitrogen from the air ceased to be of service in the manufacture of nitrates for explosives and it was urged in Congress that money be appropriated to furnish power for a fertilizer plant. Representative Longworth of Ohio said: "We have not only spent \$60,000,000 on this site, but we are preparing to spend \$14,000,000 more. According to the testimony of the Secretary of War, \$74,000,000 of the people's money will be spent and can't be used for any other purpose than to aid one factory in turning out an inferior grade of fertilizer." In March announcement was made of the organization of the United States fixed nitrogen administration to take over and operate all plants to

furnish nitrogen and similar military necessities. The organization will be entirely civilian and will be under the collective control of the Secretaries of War, Navy, Interior, and Agriculture. A "fixed nitrogen research laboratory" was organized in August in the nitrate division of the Ordnance Department, with headquarters at the American University in buildings formerly occupied by the Chemical Warfare Service. The work carried on during the war on the fixation of nitrogen in the Department of Agriculture laboratories at Arlington, Va., the geophysical laboratory, and elsewhere, is now concentrated at the American University. In April an announcement was made of an organization of a syndicate of all the German nitrogen plants under the direction of the Ministry of Finance. The government, which invested heavily in this war-born industry, having secured a controlling influence and the right to fix prices, proposed to validate the syndicate by legislation and to submit a contract with the consumers to the National Assembly for ratification. Later a syndicate of nitrogen producers in Germany was organized on May 8th, as a limited-liability company under the name of Stickstoff-Syndikat. Three great groups of nitrogen producers united and formed a common agency for the sale of their products. The government is represented both on the board of directors and in the management. Under the guidance of the Ministry of Economics nitrogenous fertilizers are to be distributed to the farmers at the lowest possible prices and in quantities sufficient to make possible an increase of agricultural production.

FUEL. The absolute necessity of finding adequate methods of providing fuel to protect the world against the effects of cold, especially in Europe where the suffering has been so great during recent winters, is a problem that is proving slow of solution. The difficulty has increased recently by the growing scarcity of coal due perhaps to its ever increasing use in industrial plants, and on account of the various strikes. The only available substitute seems to be peat, concerning which, see YEAR BOOK for 1918, (p. 126). In the United States the output of peat last year far exceeded that of any preceding year and the general increase which was stimulated by the war, was shared by practically all branches of the industry. According to British authorities the scarcity of coal due to the absence of miners at the front, raised the question of coal substitutes, and peat is mentioned as a suitable alternative for low-grade fuels. Peat deposits in England, Scotland, and Wales have remained almost untouched because of the low price of coal, but war conditions, necessitating, as they have, the restriction of coal supplies, bring the possible utilization of peat to the fore. According to the estimates of those who have studied the matter, available low grade fuel in the form of peat is greater than all the world's sources of coal. In the United Kingdom peat area is estimated at 9400 square miles, while that of Canada is 37,000 square miles, of an average depth of 6 feet. Of this area, 12,000 square miles are located in the central provinces and represent the heating equivalent of 5,000,000,000 tons of anthracite. It is reported that the Canadian government has directed its attention to the development of peat, and its Department of Mines has, within the last 10 years, mapped out 58 Canadian peat

¹ *Journal of Industrial and Engineering Chemistry*, vol. xi, p. 682, July, 1919

bogs conveniently situated with respect to inhabited and industrial centres. Peat is also available as a source of producer gas, and has proved a success. One great difference between peat and ordinary producer gas lies in the high moisture content and the greater proportion of carbon dioxide in the gas produced. Peat has a high nitrogen content, sometimes reaching 2 per cent, and is therefore a valuable source of ammonia and other nitrogen compounds. As a fertilizer, peat was first marketed in the United States in commercial quantities in 1908, and stock-food peat in 1912, and though there is still some prejudice against its use the agricultural branch of the industry has been successful and the quantity of fertilizer and stock-food peat annually produced is increasing. In England a process has been invented for utilizing ordinary household refuse such as ashes, cinders, paper, straw, and vegetable matter which can be made into fuel, thus conserving the coal supply. The process is as follows: On arrival at the disposal works the refuse is tipped into a crusher and reduced to powder. It is then lifted by an elevator and made into small blocks by means of a briquetting machine. From the briquetting machine the blocks are placed on carrying trays capable of holding approximately one ton, and conveyed by means of an overhead traveling pulley into a drying store. One day is usually sufficient for air drying, the briquettes being fairly porous and on the day following the trays containing the briquettes are dipped bodily into tanks holding a mixture of oil-tar and pitch of such a consistency as to permeate the whole of each briquette. Thence the blocks are taken to the storage bins and can be used as fuel when required. If fuel of greater calorific value be required, the briquettes, instead of being dipped are placed in a cylinder and impregnated under pressure.

MOTOR FUELS. In March the Bureau of Mines announced the development of a motor fuel which adds 10 miles an hour to the speed of airplanes and has possibilities for use in automobile racing. The liquid, a combination of benzol and cyclohexane, called hextor, is so expensive that, while of military value, it is not regarded as practical for commercial purposes. Another combination developed by the Bureau, consisting of benzol and gasoline, has been found to be more powerful than gasoline alone and is expected to prove of value in industry. The United States Industrial Alcohol Company patented in April a new fuel with an alcohol base, concerning which it is said that while all previous fuels with an alcohol base had the disadvantage of separating into their constituent elements under changes of temperature, this does not occur in the new fuel. Long tests have shown no corrosive action on the engine parts. This corporation has patented a series of fuels, all with an alcohol base. During the year at the request of the General Engineer Depot of the War Department, the Bureau of Standards made tests of several gasoline substitutes of the same general characteristics which were developed under the direction of the Engineer Depot and one of which has been designated by them as "Liberty Fuel." These tests were run only in truck and aeronautic engines, coupled to electric dynamometers. The results obtained did not differ materially from those with corresponding grades of gasoline.

ALCOHOL. The increasing demand for alcohol for power and traction purposes led to a report by the British Inter-Departmental Committee on the Production and Utilization of Power Alcohol, which was made public during the summer. It discussed the possibility of obtaining large supplies of alcohol synthetically from the products of coal distillation. The gases produced from gas retorts and coke ovens contain about one-half of 1 per cent of ethylene, and a process is being worked out for collecting this ethylene and converting it into alcohol. Use is made of the property possessed by cooled charcoal of absorbing gas, and the charcoal, when charged with the gas, is carried in a stream of molten lead, the heat of which causes it to give up the ethylene, which is then treated catalytically for the production of alcohol. It also recommended that steps be taken to increase the production of power alcohol by the extended use of the vegetable matters from which it may be obtained, such as: 1. Sugar-containing products, as molasses, mahua flowers, sugar beets, and mangolds; 2. Starch or inulin-containing products, as maize and other cereals, potatoes, and artichokes; and 3. Cellulose-containing products, as peat, sulphite wood-pulp lyes, and wood. From Sweden come reports of making alcohol from white moss, of which there are enormous quantities available. The quality of the product is said to be very good, and its cost less than spirit made from grain or potatoes. It can be easily denatured. Other sources recommended in Sweden are peat and lava. The method of extracting alcohol from peat is about the same as by sulphite. The peat is boiled under pressure with sulphuric acid, by which a sugar solution is obtained and some residue products. After the acid has been neutralized with lime, the sugar solution is made into alcohol and the peat residue collected and made into briquettes for fuel. Lava was used as a source for alcohol in the middle of last century when the potato crop failed, but it has since then been neglected.

FERTILIZERS. In addition to the growing use of peat as a fertilizer, already mentioned, there is reported the successful operation of a factory at Turk's Inlet in British Columbia where from fish offal there is made fish meal which is a valuable fertilizer, and fish oil, which is used in soap making. During the year there was an increasing demand at high prices for fertilizers in Norway and the largest Norwegian water power development company now devotes its chief attention to the utilization of electric power in the manufacture of saltpetre and artificial fertilizer, the nitrogen being obtained from the air.

PAPER. Production of a high grade white paper from cotton linters after long experiment by the Bureau of Standards was announced on April 14th by Secretary Redfield. It is believed that the process can be made profitable, opening an important new source for the production of paper and saving many thousands of pounds of material for which there has been small use hitherto, except in the making of explosives. In the *Commercial Reports* for July 31, issued by the Department of Commerce, there was published an elaborate report on "Paper-Making Materials of the Philippines" in which bamboo, cana hojo, abaca, cogon, and other plants were fully discussed, with methods given for their treatment, largely resulting from a careful study of

the subject by George F. Richmond of the Philippine Bureau of Science. In Mexico the white pine of northern Chihuahua is being used for the manufacture of paper boxes. In Europe during war times the use of paper textiles increased greatly. In Great Britain as well as in the Central Empires, the use of paper yarn as a substitute for jute and hemp attained undoubted success, while the many uses to which paper yarn was put have been given in previous articles in the YEAR BOOK for 1918 (see p. 127) in sufficient detail. During the war the paper industry naturally flourished to a considerable extent in Sweden where prices advanced owing to increased cost of labor, while the export business became more or less disorganized owing to lack of shipping. Reports from Russia show an increasing consumption of paper with decreasing local output owing to disturbed conditions. The paper mills in Grenoble, France, are reported as unable to manufacture their well known paper owing to inability to produce or to find in France sufficient pulp for their needs. In Italy the scarcity of paper has been so great that the Minister of Industry, Commerce, and Labor issued a circular calling upon editors of newspapers to decrease their consumption. Spain erected new factories in which esparto grass, vine shoots, and similar materials are being used as a source for paper. Rice straw, colored cotton rags, and waste paper are among the materials available in Egypt, none of which are suitable for making first-class papers, and their use is limited to the manufacture of cheap papers, cardboards, and wrapping papers. Papyrus, reeds, and bagasse may eventually be convertible into good white papers by new and improved methods, but meantime they are used only as additional materials for cardboard and wrapping papers.

GLASS. The American Chemical Society began in July a campaign against importing scientific apparatus from Germany, especially glassware, and it is contended that, so far as pottery and glassware are concerned, manufacturers in the United States are now able to produce goods equal to the best product of foreign make. Similarly in England where according to an article in the *London Times* of April 21, "the manufacture of laboratory glass started at Sheffield since the war has made substantial progress." Prior to the war there was no manufacture of laboratory glass in Great Britain, and the whole process, hitherto confined to Germany, had to be discovered and workers especially trained. With this object, a department of glass technology was opened in Sheffield University with the support of the government, and to-day the department is turning out work said to equal anything Germany ever produced. Also the manufacture of lenses especially designed for photography from the air was started in England, during the war. A large firm of scientific instrument makers, located at Leicester, recently enlarged its plant to meet the increasing demands for this article. Extensive tests have been carried out, and the results gained indicate that the lenses are superior to those hitherto made in Germany. The glass used in the making of these lenses is manufactured in the vicinity of the cities of Derby and Birmingham, England. From Belgium it is reported that with a few exceptions, the plate and window glass factories are in

shape to resume work. The utilization of their resources is also favored by a syndical organization which is of long standing and especially solid. In the cut-glass industry, there is possibility of partial resumption; the great factory of Val-Saint-Lambert can begin work if it can obtain raw materials.

TEXTILES. The subject of textiles and textile substitutes, concerning which see the somewhat optimistic summary in the YEAR BOOK for 1918 (p. 127) has experienced a set back. The many inventions have become less frequent and the enthusiasm has largely waned. Even from Germany comes the statement: "The promise that the new textile materials would soon be produced in sufficient quantities to provide clothing even for the civilian population of Germany has not been fulfilled, and the scanty reports still appearing hardly hide the fact that the textile substitute movement has been almost a failure." Also paper yarn now seems to be wholly unsuitable for the manufacture of clothing. It is employed exclusively in the weaving of small mats, carpets, blankets, bags, and as a substitute for leather. The great scarcity of clothing in Germany has rendered necessary the use of cloth woven of paper yarns mixed with yarns of wool, shoddy, and waste cotton. Little is heard about yarns of nettle, broom, or pine needle fibres, and their manufacture or application. The only textile material which still possesses some importance is the so-called staple fibre, and it seems that, besides the paper yarn, these staple fibres are the only ones that are produced on a large scale as a substitute for cotton. The process of their manufacture is known to be closely related to the well-known method of producing artificial silk. The cloth woven from these yarns was employed almost exclusively for the use of the army, and the expectation that the civilian population will also be benefited by the invention does not seem likely to be fulfilled soon. The raw materials for staple fibres are available in unlimited quantities; hence it is expected that when the chemicals reserved for the manufacture of explosives during the war shall be released, the production of staple fibres will be undertaken on a much larger scale, and that Germany will become largely independent of foreign countries so far as the supply of textile materials is concerned. It is doubtful, however, whether the cloth woven of staple fibres will be durable enough and whether it can be washed. From England comes the announcement of a new textile fabric, which, it is claimed, will tend to lower the present high cost of men's clothing, and which was introduced by a Pudsey manufacturer. The London agents of the inventor say that the new cloth is made entirely of silk noil or short fibres; and that, while superior in wearing properties to a pure worsted, it can be sold at the price of shoddy cloth, or one-fourth the price of the best wool fabrics. It is said to be strong and almost untearable, very suitable for hard wear, and is made in grays, browns, and blacks. The *Il Sole*, published in Milan, contained in its issue of November 21 an article on the glass industry, in which it was said that after a series of experiments made in Venice and Murano by Luigi Bisigato, felt and cloth made from spun glass are successfully produced there. A new concern, the "Vitrum," has been formed, with extensive plants at Naples, for the manufac-

ture of this felt and cloth for use as insulators in storage batteries.

PRESERVING MEAT. Announcement was made in January of the discovery of a new process for the preservation of meat by Drs. K. C. Falk and E. M. Frankel in the Harriman Laboratory of Roosevelt Hospital and perfected at Columbia University. The process consists of extracting all water from the meat by placing it in a vacuum under low temperature. The drying process, it is declared, does not coagulate the albumen or change the chemical structure of the meat in any manner. It can be kept indefinitely and has only to be soaked in water to be restored to its original weight and condition.

BEET SUGAR. This industry has long been one of the most important in France. Formerly France held first place in the world as a beet-sugar producing country, but in 1914 it ranked only fourth in Europe. Its consumption of sugar, however, steadily increased. In 1880 the annual individual consumption was 18.96 pounds; in 1890, 26.24 pounds; in 1910, 34.83 pounds; and in 1911, 37.48 pounds. The French output of refined sugar (including molasses) for 1912-13 was 877,656 tons. The consumption was 708,528 tons. Over two-thirds of the production was furnished by departments subsequently devastated by the enemy. In 1913 there were 213 sugar mills in France, while in 1917 they numbered only 61. To supply its deficit France had to import both raw and refined sugars. The government constituted itself sole purchaser of this article and prohibited importations by individuals. The colonies of Guadeloupe, Martinique, and Reunion with an annual joint pre-war output averaging 110,000 tons, were able to supply a part of the deficit. The government immediately purchased the entire production of these colonies and stored it pending transportation by vessels allotted to France by the Inter-Allied Council. The decreased output of sugar is not wholly attributable to the destruction of sugar factories. A contributing element was the reduced planting of sugar beets. A considerable part of the beet-sugar farms of northern France were bombarded heavily, with the result that the land will not be tillable for years. The output of beets has also been affected by the government control of the price of sugar, which, in turn, has limited the price of beets. In 1915-16 only 1,146,207 tons of sugar beets were grown in France, but in 1916-17 the production increased to 1,595,868 tons, owing to the average production to the hectare having increased from 18.13 tons to 23.14 tons. The normal production to the hectare was, in pre-war days, about 26 tons. The regeneration of the beet sugar industry of France will require attention. The total losses due to the war in this industry are placed at \$187,789,000. The destruction of the homes of the workmen engaged in sugar manufacturing, the reconstruction of the mills, and the transformation of battlefields into workable farms present real difficulties in the way of complete restoration of this industry. Nor is that all, for the Germans not only destroyed the factories but carried off the machinery and the designs from which it was constructed. As the planting of beets takes place in the spring and as acreage was decidedly smaller in 1919 than that required by national demands, the deficit

in sugar will continue for another year, and imports will be necessary to meet the requirements of the country.

ASPHYXIATING GASES. The subject was quite fully discussed in the YEAR BOOK for 1918 (p. 131) and there remains only to add a brief tag. According to an official report issued in March, up to June, 1918, the shipment of gases in bulk made to the American forces in France to be exchanged for gas shell was: mustard gas, 15 tons; chlorpicrin, 705 tons; phosgene, 48 tons. Sales of some excess gas were made as follows: England 900 tons of chlorpicrin and 368 tons of phosgene. To France was sold 300 tons of chlorpicrin and 1408 tons of chlorine, equivalent to 1126 tons of phosgene. In addition to the above, 200 tons of mustard gas were shipped to England for loading shell originally made for Russia. There were, therefore, shipped to Europe 3662 tons of gas, or its equivalent, which gas was largely loaded into shell and used by the United States troops, or those of our Allies, against the enemy. In addition to this, 18,600 Liven drums loaded with phosgene were shipped to France. These contained 279 tons of gas, and some of them were fired at the enemy. As soon as shells were available they were loaded with gas, and 25,000 shells 75 mm. calibre were shipped to France on Aug. 7, 1918. On August 9th another shipment of 50,000 shells of the same calibre was made, after which time shipments were made as fast as shell and boosters were available. At the time of the signing of the armistice a very large quantity of this most poisonous gas remained on hand and iron containers holding all that was returned from abroad and all that was in the United States were loaded on a transport and taken 60 to 100 miles out to sea and lowered over the side into water three miles deep. Rust will eat pin holes into these containers, and there will be a minute and gradual intermixture of water with their fatal contents. Under such circumstances there is no flame but a slow chemical reaction which produces two non-toxic compounds. The literature, which is considerable, includes: *The Manufacture and Use of Toxic Gases*, by William H. Walker, and *The Manufacture of Gas Defense Apparatus*, by Bradley Dewey, both of which were published by the American Chemical Society.

LITERATURE. A weekly journal devoted to industrial and engineering chemistry called *The Chemical Age*, made its first appearance in London, England, on June 21st. See "A Brief Survey of Some Recent Chemical Literature" in *Science* for September 12, concerning recently published text-books and the like on chemistry.

CHESS. Jose R. Capablanca of Havana retained his laurels as the leading chess expert of the world during the year 1919. His principal feat was the winning of the Victory Tournament of the British Chess Federation at Hastings, England, without the loss of a game. Earlier in the year Capablanca defeated Boris Kostich, the Serbian player, in a match contested at Havana, Cuba, also without meeting a single reverse. The champion added to his fame when in a tour of Great Britain he played in more than a thousand games in simultaneous exhibitions, losing less than 30.

The Western championship of the United States, played at Cincinnati, was won by Edward Lasker of Chicago. The State champion-

ship of New York again fell to the lot of A. Kupchik while title honors in the Metropolitan Chess League were again captured by the I. L. Rice Progressive Club. City College of New York won the Triangular College League championship.

CHICAGO, UNIVERSITY OF. An institution of higher learning founded in 1891 at Chicago, Ill., largely through gifts by John D. Rockefeller, who has continued to aid the university. In the summer session of 1919 there were enrolled 1954 graduate students, 1323 undergraduates, and 1921 professional students, a net total of 5013. In the autumn of 1919, the enrollment was as follows: Graduate, 681; undergraduate, 2531; professional, 1490; university college, 1219; a net total of 5650. There were 346 members of the faculty. Productive funds of the institution amounted to \$32,537,886 and the income for the year was \$1,874,182. The library contains 570,849 volumes. President, Harry Pratt Judson, LL.D.

CHILD LABOR. During 1919, Child Labor, in common with most of our social questions, escaped from the localizing restraint of national boundaries, and was considered as an international problem. Labor scarcity during the war had, in almost every country, made necessary the employment of children on a scale that was not permitted by pre-war standards. (See YEAR BOOK, 1918). The need for readjustment was very generally felt, and accordingly the Commission on International Labor Legislation, (vol. ii, Labor, Am. Fed. of), appointed by the Peace Conference, recommended to the Conference certain standards, which, it was hoped, could be made effective in all the nations represented. These recommendations provided that: "No child should be permitted to be employed in industry or commerce before the age of 14 years, in order that every child may be assured reasonable opportunities for mental and physical education; between the ages of 14 and 18 young persons of either sex may be employed only on work which is not harmful to their physical development, and on condition that the continuation of their technical or general education is assured."

These recommendations were formally acted upon by the Peace Conference, and on April 28, 1919, they were, in an emasculated form, incorporated in a "Sixth Labor Clause" which provides for "the abolition of Child Labor and the imposition of such limitations as shall permit the continuation of their education, and assure their proper physical development."

Again, at the International Labor Conference of the League of Nations, held in Washington, D. C., from October 29 to Nov. 29, 1919, was Child Labor one of the topics of discussion. "Draft Conventions" were adopted, from which the most important are quoted: "Children under the age of 14 years shall not be employed or work in any public or private industrial undertaking, or in any branch thereof, other than an undertaking in which only members of the same family are employed. Young persons un-

der 18 years of age shall not be employed during the night in any public or private industrial undertaking, or in any branch thereof, other than an undertaking in which only members of the same family are employed . . ."; in both cases certain exceptions are enumerated. Each nation ratifying a convention agreed to bring its provisions into operation not later than July 1, 1922.

THE SECOND PAN-AMERICAN CHILD WELFARE CONGRESS. The Second Pan-American Child Welfare Congress convened in Montevideo, Uruguay, from May 18 to 25, 1919; some 1500 persons, including the representatives from the various American nations, were in attendance. A resolution was adopted providing for the creation of an International American Bureau for Child Welfare, having its seat in the city of Montevideo; further resolutions recommended a flat 15-year age limit for working children, with compulsory school attendance up to and including that age, a 16-year limit for industrial labor, a six-hour day for all under 19 years of age, the prohibition of dangerous employment and night work for minors, and compulsory vocational instruction for children of both sexes between the ages of 14 and 18; a broad health program was also adopted.

INTERNATIONAL CONFERENCE ON CHILD WELFARE. A four-day conference on Child Welfare standards was held in Washington, D. C., May 5 to 8, 1919, under the auspices of the Federal Children's Bureau; delegates were present from all sections of the United States, and from Great Britain, Belgium, France, and Japan. The general topic of Child Welfare was discussed, and minimum standards of age, education, physical qualifications, and wage, were decided upon for children entering employment; standards were set for hours of labor, and plans worked out for placement and employment supervision and general administration of welfare work. It was decided that these recommendations should be submitted to the nine regional conferences which were arranged for in various cities throughout the United States. A committee on Progressive Child Labor Standards was created, to act in an advisory capacity to the Children's Bureau in Washington.

THE UNITED STATES:—FEDERAL CHILD LABOR LAW. Of chief importance among Child Labor Legislation for the year is the new Federal Child Labor Law. The former law which attempted to prohibit child labor through interstate commerce regulation, was declared unconstitutional by the Supreme Court of the United States on June 3, 1918. (See YEAR BOOK, 1918). The new bill was introduced in the Senate by Senator Pomerene on Nov. 15, 1918, was adopted by the Senate (vote of 50 to 12) on Dec. 18, 1918, as Sections 1200 to 1207 inclusive, of the Revenue Act, Public Statute No. 254, 65th Congress, (H. R. 12863) and was signed by the President on Feb. 24, 1919.

The prohibitions of the new law are substantially the same as the former act, but enforcement is effected through the Federal Taxation Power; its provisions, as summarized by the conferees of the House and Senate, are as follows:—

"This amendment imposes a tax of 10 per cent on the net profits from the operation of (a) any mine or quarry situated in the United States in which children under the age of 16 years have

been employed or permitted to work during any portion of the taxable year; or (b) any mill, cannery, workshop, factory, or manufacturing establishment situated in the United States in which children under the age of 14 years have been employed or permitted to work, or children between the ages of 14 and 16 years have been employed or permitted to work more than 8 hours in any day, or for more than 6 days in any week, or after the hour of 7 o'clock p. m., or before the hour of 6 o'clock a. m., during any portion of the taxable year. Such a tax is not to apply in case of an employer relying in good faith upon an employment certificate issued under regulations prescribed by a board composed of the Secretary of the Treasury, the Secretary of Labor, and the Commissioner of Internal Revenue; nor in case of an employer who satisfies the Secretary of the Treasury that his employment of a child under the prescribed ages was due to an honest mistake of fact as to the age of such child."

This law became effective on April 25, 1919, on May 2, Federal Judge James E. Boyd, of North Carolina, made permanent a temporary injunction preventing the Atherton Cotton Mills from discharging John W. Johnson (an employee between the ages of 14 and 16) or curtailing his employment to eight hours per day. W. C. Hammer, United States Attorney for the Western District of North Carolina, appeared as "amicus curiae" but his contentions were overruled by Judge Boyd, who declared the law unconstitutional on the ground that "Congress was trying to do by indirection what it had no constitutional power to do directly." The case reached the Supreme Court of the United States on Dec. 10, 1919, but no decision had been handed down by the end of the year.

Prognostication seems to favor the law's sustinment, for precedents of prohibitory taxation have been established in the oleomargarine and poisonous phosphorus match cases. But the handing down of such a decision will leave the horizon clustered with still other complications. For since the Child Labor Law is part of the Revenue Bill, its enforcement is in the hands of the Commissioner of Internal Revenue, and funds appropriated to the Secretary of Labor for enforcement have been ruled unavailable for use until the latter has been requested to act by the former official. Most important of all, the Child Labor Law will in any event lapse with the Revenue Act of 1918, which is effective "until Congress passes an act abrogating the same," and the Revenue Act is not likely to remain in force for more than two years; at that time the Child Labor Law must be made a part of the new revenue act, or an attempt be made to enact it as a separate piece of legislation.

STATE LEGISLATION. Out of our 50 States and territories, 30, during the past year, made more effective child labor laws, or strengthened the complementary school attendance and continuation school legislation. Two States weakened their child labor laws; Connecticut enacted a provision enabling the governor to suspend night work prohibition in case of emergency, and Vermont passed a measure authorizing the Commissioner of Industries, with approval of the governor, to suspend age and hour limitations in the case of perishable products—a seemingly innocuous provision which, in effect, may permit canneries to employ children for more than

eight hours per day. Alabama adopted an eight-hour day and 48-hour week for work in all gainful occupations for children under 16, and strengthened work permit provisions. Arizona limited exemption from school attendance to children over 14 who are regularly employed, and required continuation school attendance between 14 and 16 for five hours per week. California raised minimum age for employment in general occupations to 16 (with exceptions) and prohibited employment of girls under 18 in messenger or delivery service; raised compulsory school age to 16 (with exceptions); made compulsory four hours of school attendance per week for children between 14 and 18. Connecticut strengthened work permit provisions; required evening school attendance for children between 14 and 16 who have not completed elementary school. Delaware raised compulsory school attendance to 17 (with exceptions) and required 100 days attendance at school per year for employed children under 17. Florida raised compulsory school age to include children from 7 to 16, and made compulsory attendance provisions state-wide in application. Georgia raised period of required school attendance to 6 months, required completion of the 7th grade, and abolished poverty exemptions from school attendance. Illinois raised period of required school attendance to 7 months, and required compulsory continuation school attendance of 8 hours per week, between the ages of 14 and 18 years. Iowa required continuation school attendance of 8 hours per week between 14 and 16 years, excepting on completion of 8th grade and regular employment. Kansas raised compulsory school attendance to 16 years (with exceptions). Maine raised minimum age to 15 for employment during school hours, strengthened work permit provisions, and prohibited night work for children in bowling allies and pool rooms. Massachusetts reduced hours for children from 16 to 18 to 8 per day and 48 per week; required completion of 6th (instead of 4th) grade for school exemption. Missouri prohibited employment of females under 18 as messengers, changed compulsory school age to 7-14 instead of 8-14; inaugurated compulsory continuation schools 4 hours per week for children between 14 and 16 (attendance compulsory to 18 for children who have not completed the 8th grade). Montana prohibited any employment for children under 16 during school term, strengthened work permit provisions, raised compulsory school age to 18 unless employed or completed high school, required 4 hours per week for extension school work between 14 and 18. Nebraska raised period of required attendance at school to a minimum of 12 weeks in rural districts, and made continuation school attendance compulsory between 14 and 16 years. Nevada raised compulsory school age to 18, unless employed or completed high school (poverty exemptions were retained) and required continuation school attendance of 4 hours per week between 14 and 18 years. New Hampshire made compulsory school attendance for non-English speaking minors between 16 and 21 years. New Jersey established a 42-hour week for children under 16 in districts where continuation schools were established, and required attendance at such schools of children between 14 and 16, 20 hours per week if unemployed, and 6 hours per week if employed. New Mexico raised compulsory

school age to 16, unless 14 and employed, provided for work permits for children under 16, and made compulsory continuation school attendance between 14 and 16 years, 5 hours per week. New York prohibited employment of girls under 18 operating elevators, and under 21 in transportation service, and regulated hours and night work in those occupations; required continuation school attendance between 14 and 18 years, 4 to 8 hours per week. North Carolina prohibited employment under 16 in mines and quarries, and under 14 in factories, mills, offices, hotels, mercantile establishments, etc., or in messenger and delivery service; prohibited night work in these occupations; raised required school attendance to full term and abolished poverty exemption clause. Oklahoma raised compulsory school age to 18, unless employed and completed 8th grade, and required continuation school attendance between 16 and 18 years (with exceptions). Oregon raised compulsory school age to 18 for all unemployed children, and provided compulsory continuation school attendance for children between 16 and 18 years, for 5 hours per week. Pennsylvania prohibited employment of girls under 18 in messenger service. South Carolina prohibited employment under 14 in workshop or business establishment during school hours (with exceptions) and made its compulsory school attendance provisions state-wide in application. South Dakota strengthened its child labor enforcement laws, and made compulsory attendance at evening school of illiterate and non-English speaking persons between 16 and 21 years of age. Tennessee raised compulsory school age to 16, and made it state-wide in application. Utah made continuation school attendance compulsory for 4 hours a week to children under 18, and likewise for all non-English aliens between the ages of 16 and 45; raised compulsory school attendance age to 18 for unemployed children, and extended 30-week term to apply to all districts. Washington strengthened work permit provisions, and required continuation school attendance for 4 hours per week, between 14 and 18 years (with exceptions). West Virginia prohibited employment in any gainful occupation for children under 14 (with exceptions); prohibited employment in dangerous occupations under 16; prohibited night work and established an 8-hour day, 48-hour week for minors under 16; in occupations prohibited under 14; strengthened work permit provisions.

FOREIGN. The year 1919 has seen little direct action on the child labor question in Great Britain, legislation correcting wartime abuses having been enacted the previous year. (See YEAR BOOK, 1918). However further legislation may be expected in the near future, for the English joint industrial conference of employers and employees reported: "The Committee are of opinion that child labor is bad in principle, and in practice tends to decrease the chances of adult employment. For these reasons, without going into details, the Committee think that the age at which a child should enter employment should be raised beyond the present limit." (14 years.) In addition the Committee recommended an eight-hour day for all persons employed, as well as the establishment of a nationwide minimum wage. Both of these measures would tend to reduce child labor, by rendering it unprofitable. The Director of the Commercial

Department of the Bureau of the Russian Socialist Federal Soviet Republic reports that Russia has adopted a 16-year limit for entrance to full time employment, and has developed a complementary educational plan. He states that when trade is resumed with foreign countries, no goods will be allowed to enter Russia that have been manufactured by child labor. Poland, according to the Programme of the Polish Minister of Education, provides that all children must attend school for at least seven years. The programme of the German Teachers' Association calls for free universal education, with maintenance and clothes for necessitous children, and the extension of common and continuation school education made compulsory for children up to 18 years of age. Mexico has enacted a new law prohibiting night work in factories and dangerous occupations for all women, and for children under 16 years of age, and prohibits night work in commercial establishments for the same after 10 o'clock at night; it limits the work of children between 12 and 16 to six hours per day, and provides that the work of a child under 12 years of age shall not be made the subject of contract.

Information on the subject of child labor and child welfare may be obtained from the U. S. Department of Labor, Children's Bureau, Washington, D. C., and from the National Child Labor Committee, 105 East 22d St., New York City.

CHILD WELFARE. See CHILD LABOR.

CHILDREN'S COURTS. See JUVENILE COURTS.

CHILE. A South American republic on the west coast extending along the Pacific to the south from Peru. Capital, Santiago.

AREA AND POPULATION. The length of this long narrow strip between the crest of the Andes and the Pacific is 2628 miles—from the Peruvian border to the southern end of South America. The average width is 177 miles. There are 23 provinces and one territory, with an estimated total area of 289,829 square miles. The population in 1907 (the last census) was 3,429,279 of which 43.4 per cent was urban. The foreigners at that time numbered about 134,324. The population January, 1918, was estimated at 3,880,854 or a density of 13.4 to the square mile. The population of some of the principal towns in 1916 was: Santiago, 397,550, (estimated in 1918 unofficially at 400,000); Valparaiso, 201,507. Concepcion, 68,902; Iquique, 45,502; Talque, 41,618; Chillan, 38,543; Antofagasta, 56,295. The majority of people are of European origin, only one-fourth being of pure Spanish stock. The Indians may be divided into three classes—the Changos, who live in the northern coast region; the Araucans, about 100,000 in number, who live on the western slopes of the Andes; and the Fuegians who live in or about the region of Tierra del Fuego. Santiago is a city of cathedrals, squares and other public works, with monuments and park systems; it is also the seat of two universities—the University of Chile and the Catholic University. Valparaiso is the second city of Chile and the seaport of the country. It is situated on the southern side of a large harbor of the same name from which there is a level stretch to the hills inland. The residential district is in the hills mainly.

MINERALS. Prosperity is largely due to the

development of natural deposits of sodium nitrate, "Chile saltpetre," the tax on which constitutes a large portion of the revenue of the State. Copper ranks next in importance as a mineral product, and besides this cobalt, gold, silver, and manganese are found. Of the non-metallic products, coal, borate, salt, sulphate, and guano are important. Coquimbo has been the scene of some development of iron ore, estimated at over 200,000,000 tons. The total value of mining products was 614,775,876 pesos (exported).

Sodium nitrate was discovered about 1809 by the Indians. Till 1830 its export did not amount to much, but after then the production increased. One of the factors of this increase was the ease with which one could get a government grant of two estacas, that is, about 72,000 square yards. This lasted till 1868. The desert of Atacama, about 500 miles long about 2000 to 6000 feet above sea level, is the scene of the activity on nitrate beds. This gives an area of 200,000 square kilometers, of which only 4 per cent had been surveyed in 1918. Chile, Bolivia, and Peru furnish the labor, and an estimate gives us the point that about 50,000 men were employed in this industry at that time. The total number of tons that this labor has extracted from the surveyed area of 200,300,000 tons, is about 50,000,000 tons. Californian and Mexican oil is supplanting coal as a fuel to work these mines. In 1915 only 34 of the 167 plants were in operation, due to war-disorganized production. When the demand for it as a munition ingredient raised the price to double its former figure, production was again stimulated. The United States, early in the war, organized a committee to supervise and regulate the nitrate production in the United States, realizing its agricultural importance as a fertilizer, as well as its munition importance. A table of nitrate production and shipment is given below:

	<i>Metric tons produced</i>	<i>Labor No. of men</i>	<i>Exportation Metric tons</i>
1914	2,463,356	43,979	1,846,783
1915	1,755,291	43,506	2,023,294
1916	2,912,681	44,234 (est.)	2,981,401
1917	*	* 60,800,000

* This quantity in quintals.

The nitrate situation caused a great deal of worry during the war, and domestic production was stimulated so as to release to the United States and Great Britain for other war purposes the cargo vessels necessary for its shipment. The western agricultural portion of the United States felt this particularly. For the five years preceding 1915 the average annual production of coal was placed at 1,193,406 tons, and the domestic consumption of coal at 2,667,235, and the imports at 1,473,829 tons. This latter figure has decreased considerably since the gradual introduction of oil burning machinery.

INDUSTRY. For figures on industries, see preceding YEAR BOOKS. High prices and scarcity of imported leather owing to the isolation of European products because of the war, have stimulated that branch of manufacture till in 1919 it was assuming proportions of considerable size. As an indication of what this industry can accomplish, the figures of 1898 can be recalled. In that year 3,102,888 kilos of sole leather was exported. In 1915, the exports went as low as

393,460. Since then they have risen considerably. Northern Chile manufactured more for home consumption, while southern Chile maintained the export trade. Exports of leather to the United States particularly, have increased. Agrarian industry is developing rapidly with the introduction of many refined agricultural implements imported from the United States.

RAILWAYS. It was announced in December that the Chilean Congress had authorized a contract with a Chilean-Ecuadorian syndicate for the construction of a railroad to extend eastward from Porto Bolivar, Ecuador, into Brazil. This would afford a Pacific outlet to a rich territory hitherto inaccessible. It was proposed to extend the line about 563 miles to Porto Para on the Amazon River in Brazil at a cost of about £6,000,000 sterling.

The Public Works Department of Chile in 1919 was preparing studies for important constructional work, including new railways, upon which \$2,000,000 was to be expended for equipment. The completion of the new railway between the capital, Santiago and Valparaiso by way of Casablanca was to be the first work to be undertaken and it was estimated that the cost would be approximately 45,000,000 Chilean paper pesos which, at the prevailing rate of exchange, would be £2,432,432. This line it was proposed to work by steam, but the existing line between Valparaiso and Santiago will be converted to electrical operation in the near future as a part of a larger scheme of electrification.

Other work to be carried out included the proposal of the construction of a line from Larrain Alealde to Pichilemu, the project for a new reinforced bridge over the Maipo River, on the Paine-Talagante line, and the completion of the various plans and estimates for the railway from Los Angeles to Santa Barbara and Quilleco. It was also announced during the year that the sum of 25,000,000 pesos, gold was to be expended upon the electrification of the first zone of national railways, in which is included the Valparaiso-Santiago line.

FINANCE. The monetary unit, the peso, has a value of about 36.5 cents. Exchange rates, however, fluctuate, due to the readjustment from the war. The revenue for 1915 was £9,340,733; for 1916, £13,814,101; for 1917 (estimated officially), £9,721,000. The expenditures have been, for 1915, £9,987,438; for 1916, £11,305,498; for 1917 (estimated officially), £9,572,076. The following is the 1919 budget, in gold pesos:

<i>Departments</i>	<i>Pesos</i>
Interior	179,573
Foreign relations, etc.	1,948,562
Justice	* 11,160,000
Public instruction	136,534
Treasury	40,093,996
War	155,643
Navy	1,856,763
Industry and public works	28,772
Railways	1,832
Total gold pesos	43,796,875
Total paper pesos	201,549,472

* Paper pesos

On Jan. 1, 1918, the external debt amounted to 31,035,820; the internal debt to 42,708,193 pesos currency. On Jan. 1, 1917, the value of the 5208 national properties was 305,216,461 pesos currency. Paper money in circulation at the same time had a face value of 177,980,119 pesos.

DEFENSE. The compulsory military service liability lasts from the age of 18 to 45, inclusive. Recruits are trained for one year, and then have a reserve service in the army of nine years, and then remain in the second reserve until their 45th year. The total strength of the Chilean army was, in 1916, 1020 officers and 17,283 men. The Chilean infantry use the 7 mm. calibre rifle (1895), the cavalry using carbines and lances. The artillery are equipped with Q. F. Krupp guns. In December, 1918, an Air Force was organized with 14 seaplanes and 50 airplanes, purchased from the British government. The principal vessels of the Chilean fleet are the *Captain Prat*, the *Esmeralda*, and *O'Higgins*—predreadnaught and armored cruisers, respectively of about 7500 average displacement tons. There are also 11 destroyers, 5 modern torpedo boats, and 2 training ships.

GOVERNMENT. By the constitution, dated May 25, 1833, as subsequently amended, the legislative power is vested in two houses, the Senate and the Chamber of Deputies. Thirty-seven Senators are elected for six years and 118 Deputies elected for three years. The executive is a President, elected by indirect vote to a term of five years. He is ineligible for a second term. He appoints a council of state, and Congress appoints a cabinet. There are five members of the council of state and six departments in the cabinet. President, Señor Dr. Juan Luis Sanfuentes, inaugurated Dec. 23, 1915.

HISTORY. There has been much comment on the attitude of Chile toward the war, and now that it is over the reasons have become more clear. She did not believe that the German military machine could be crushed, she did not perceive the economic results of a German victory clearly, and finally she had little faith in the military power of the United States. This explains why she did not take any part in the war and continued firm in her view. The result of the war has done much to raise the estimation of the United States military power in her eyes, and trade has felt a beneficial stimulus resulting therefrom. The long-standing dispute between Chile and Peru which at the close of 1918 threatened the revival of hostility is outlined with arguments on both sides in the *NEW INTERNATIONAL YEAR BOOK* for 1918 under the title *Peru*. The question of a plebiscite to be held in the disputed territory under article III of the treaty of Ancon was still pending in 1919 and was frequently mentioned as a subject that certainly would be one of the first to be settled by a League of Nations. The supporters of Peru's claim believed that by the nonfulfillment of article III Chile had forfeited the advantage conferred upon her by the treaty—that in fact the whole treaty had lapsed—and that even aside from this consideration a readjustment was necessary according to the principle of the Treaty of Peace that annexations by force could not be maintained. On September 18th the republic celebrated the 109th anniversary of its independence. The President and the members of the cabinet and diplomatic corps took part in the ceremony in the capital.

CHIMNEY. During the year 1919 there was completed for the Washoe Smelting Company, Anaconda, Mont., the highest chimney ever built being a brick stack 585 feet above the ground, with 60-foot top inside diameter. This new chimney was a part of a smoke treating plant

for the Washoe smelter, designed to reclaim gold, silver, copper and arsenic, which were lost in the discharge of fumes. At this plant a Cottrell electric dust-reclamation system was installed, but a greater draft was required than was furnished by the old 300-foot, 30-foot inside top diameter brick chimney. Accordingly a new stack was built about 200 feet from the old, being connected to it by an extension of the main flue, which was built of structural steel frame with brick wall. The Cottrell treating plant is located beyond the new stack, and takes the deposit of dust, which is passed through a system of treaters and furnaces. The stack stands 555 feet from the top of an octagonal concrete base 30 feet above ground level at the treater plant grade, and 33 feet above the lowest part of the rock foundation on which the base rests. This gives a height to the chimney of 585 feet $1\frac{1}{2}$ inches above the main ground level, and makes it higher than the brick stack of the Tacoma Smelting Works, which, as shown by the accompanying table, is 571 feet in height. This table, in the *Engineering News-Record* of Oct. 23, 1919, gives the dimensions of the world's largest chimneys.

TABLE SHOWING DIMENSIONS OF THREE LARGEST CHIMNEYS

	Top Inside diam ft in	Bot Inside diam ft in	Top Wall thick in	Bottom Wall thick in	Hght. above grad. ft
New brick stack, Anaconda	60	76	22 $\frac{1}{4}$	60	585
Old brick stack, Ana- conda	30	31 4	12 $\frac{1}{2}$	62	300
Tacoma brick stack Saganoseki concrete stack	23 11	39	13 $\frac{1}{2}$	61	571
	26 3	27 9	7	29 $\frac{1}{2}$	570

The concrete base of the new brick stack at Anaconda is octagonal in shape, and is 89 feet outside top diameter, and is from 10 to 30 feet above the ground. On this is placed an octagonal brick section 86 feet in diameter and 68 feet high, which carries a circular tapering brick chimney. The main shaft has five different tapers, and the thickness varies from 58 inches at the top of the octagonal section to 22 $\frac{1}{4}$ inches at the top, under the terra cotta cap. The concrete base is on good rock foundation, with a load of about 7.5 tons per square foot. The radial blocks used in the chimney were made of fine flotation tailings mixed with sand and burned at a temperature of about 1800° Fahrenheit. Some 17,000 tons of these blocks, 10,350 barrels of Portland cement, 1850 tons of fire clay, and 2700 cubic yards of sand were used in the chimney proper, and about 5100 barrels of Portland cement, 1750 cubic yards of sand, and 4700 tons of rock in the 1:3:5 concrete used for the base.

CHINA. The oldest monarchy in the world, became a republic on Feb. 12, 1912. Yuan Shih k'ai was elected president by the first Parliament on Oct. 6, 1913, for a period of five years, being ineligible to reelection for a further period of five years. Yuan died on June 6, 1916. Upon his death, in accordance with the terms of the constitution, Li Yuan-hung became president. The present holder of this office is Hsu-Shih-chang, born in Honan, 1853, and elected president Aug. 10, 1918, inaugurated Oct. 10, 1918. The seat of the government is Peking, the former seat of the imperial government.

AREA AND POPULATION. The 18 provinces into

which the country is divided, are enumerated below. Further territory of the republic is as follows: Sinkiang (including East Turkestan), the so-called "new dominion"; Manchuria, Outer Mongolia, Inner Mongolia, Tibet, including Kokonor and Tsaidam. Only a loose and variable authority is exercised over Tibet and Inner Mongolia. Outer Mongolia has been recognized as autonomous since October, 1912. For summary of changes since 1897, see preceding YEAR BOOK. Estimates of the population can only be un-official, owing to the inefficient methods of the government in compiling statistics. But the following table gives a statement of the area and population of the Chinese Republic, its 18 provinces and other territories, compiled according to figures published in the *Government Gazette*, Feb. 27, 1911.

The 18 provinces of China Proper	Area - English sq. miles	Population (estimated)	Capital (Seat of Tutuh)
Chih	115,800	22,970,000	Tientsin
Shantung	55,970	25,810,000	Ch'i-nan
Shansi	81,830	9,420,000	T'ai-yuan
Honan	67,940	22,375,000	K'ai-feng
Kiangsu	38,600	15,380,000	Nanking
Anhui	54,810	14,075,000	Anch'ing
Kiangsi	69,480	16,255,000	Nanch'ang
Ch'ehkiang	36,676	13,950,000	Hangchow
Fukien	46,320	8,560,000	Foochow
Hupoh	71,410	21,260,000	Wuchang
Hunan	83,380	20,580,000	Ch'angsha
Shensi	75,270	6,725,000	Hsian
Kansu	125,450	3,810,000	Lanchow
Szechwan	218,480	54,500,000	Ch'engtu
Kwangtung	99,970	23,700,000	Canton
Kwangsi	77,200	5,425,000	Kuei-lin
Kweichow	67,160	9,265,000	Kuei-yang
Yunnan	146,680	8,053,000	Yunnan
Total	1,532,420	302,110,000	
New Dominion:			
Hsinchiang	550,340	2,000,000	Tihuaifu (Urumchi)
Dependencies:			
Manchuria	363,610		
Fengtien		5,830,000	Mukden
Kirin		5,350,000	Kirin
Heilungchiang		1,560,000	Tsitsihar
		12,740,000	
Mongolia	1,367,600	1,800,000	Urga *
Tibet	463,200	2,000,000	Lhasa †
Grand total	3,913,560	320,650,000	

* The seat of the Bogdo Khan. † The seat of the Dalai Lama

RELIGION AND EDUCATION. Ancestor worship prevails throughout China. The three forms of religion are: Confucianism, Taoism and Buddhism. Mohammedans are found in every province of China, being most numerous in Kansu, Hsin Chiang, Chili, and Yunnan, and numbering between 5,000,000 and 10,000,000. The bulk of the people are Buddhist. The Roman Catholic natives at the end of 1916 numbered 1,700,220; the Protestant natives, 511,142; the Orthodox (Greek) natives at the end of 1915, 5587. The basis of moral teaching in the schools is Confucian. Prior to 1905 there was an old and intricate system of public examinations in the Chinese classics. On Sept. 3, 1905, however, this system was abolished, and a new educational movement for the study of western learning was instituted. Since that time, practical subjects have steadily replaced the classics in the system of instruction. Between 1912 and 1916 the number of schools was reported to have increased from 87,272 to 129,739, and the

number of students from 2,933,387 to 4,294,251. No later figures for education were available than those given in the preceding YEAR BOOK. The Boy Scout movement is fast developing in China. Over 60 schools in 1919 had Boy Scouts, with 2216 boys enrolled.

PRODUCTION. The chief occupations are agricultural and the chief crops are wheat, barley, corn, millet, and other cereals, sugar cane, rice, indigo, and fruits. One of the leading industries is silk production, which languished somewhat during the war but efforts were being made to revive it. The soya bean is widely cultivated.

The following information in regard to cotton manufactures, etc., was supplied by the United States Bureau of Foreign and Domestic Commerce in December:

With China's population of 400,000,000, all wearing cotton garments, there is no doubt about the future of the Chinese cotton-mill industry, provided it can manufacture at prices low enough to meet competition. If every person in China could afford to buy only one more suit of cotton clothes a year, 100,000 additional looms and 2,000,000 spindles would be required to produce the needed cloth. We must not, however, be carried away by these estimates, as a large share of the cotton cloth now used in China is made on hand looms by household industry. Nevertheless, there is ample room for the expansion of the cotton-mill industry, as China had in 1919 only 1,250,000 spindles and 7000 looms, while Great Britain, with only 45,000,000 people, had in 1919 58,000,000 spindles and 1,000,000 looms. The great danger is competition from other lands, unless China can rely on adequate supplies of fuel, cotton, and skilled operatives. The cost of coal in 1919 was advancing steadily owing to the high freight rates, and the remedy is the development of Chinese mines. It is necessary, also, to encourage Chinese farmers to adopt better methods of cultivation, obtain a longer staple by seed selection, and to raise larger crops. Perhaps the most important measure is the care of the workmen by providing comfortable houses, education, medical attendance, athletics and clubs. Without these, operatives are likely to become a rough class, untrained, and a danger to the district. There are needed men for foremen and managers, and it would be a good plan to send selected young Chinamen to work in foreign mills and to attend technical schools in other countries. The success of cotton factories of any kind depends upon the managers and foremen, and few Chinese have had the necessary experience, except those trained in mills under foreign supervision. The Chinese have a good share of the personality, physical fitness, common sense, and determination necessary for success, but need more specialized ability and general knowledge. It is therefore most desirable not only to train competent young men in foreign-operated mills but to establish a technical school for them in China.

RICE SCARCITY AND LABOR UNREST. The following information in regard to the failure of the rice supply was furnished by the United States Bureau of Foreign and Domestic Commerce in October: The increase in the cost of rice at Shanghai has been from \$7.60 Mexican per picul (133½ pounds) in 1913 to \$9.20

Mexican per picul in 1919. As the Mexican silver dollar fluctuates violently as compared with gold, it is not practicable to make a comparison as to the gold value of the picul unit of rice. Before the war one gold dollar was valued at more than two Mexican dollars, but for some time a Mexican dollar at Shanghai has been about on a parity with the gold dollar. Among other necessities, in addition to rice, the increase has been from 40 to 50 per cent in cotton goods, 100 per cent in silk and silk goods, 50 per cent in petroleum and candles, 150 per cent in coal, while wood has increased from 30 to 40 per cent. These estimates are based on inquiries made by the *North-China Daily News* (British) of Shanghai, which newspaper is authority for the statement that 200 years ago the price of rice was \$2 Mexican per picul. Because of the increased cost of the necessities of life, as indicated above, labor conditions in Shanghai and elsewhere in China are unsettled. In many instances, large bodies of coolies insist on increased wages in order to be able to buy sufficient food for themselves and families. Moreover, there is a growing tendency among the laboring classes in the seaport towns of China to seek increased recognition in the matter of employment, some of the trade guilds at Shanghai having developed aggressive activities to better their conditions and prospects.

MINING. Asbestos is mined in the Szechwan province of China, from where it is shipped to Chungking at a cost of \$75 per 100 lbs. In the Shensi province there is said to be a good mine, and also one near Paotingfu, but transportation facilities are poor. There are several mines located in the vicinity of Peking, but the fibres are very brittle and the product is used locally. In 1919 there was a growing tendency to develop the domestic resources. In 1918, the imports of asbestos were valued at \$148,837.

COMMERCE. Figures for the whole of China were not available. The following table shows the value of the import and export trade of Shanghai with foreign countries in 1918:

Countries	Imports	Exports	Total
British India.	\$5,759,851	\$4,979,037	\$10,738,888
Canada	9,270,403	4,831,590	14,101,993
Dutch Indies.	6,162,903	1,248,292	7,411,195
France	1,611,878	35,999,322	37,611,200
Great Britain	55,012,326	26,756,753	81,769,079
Hongkong . . .	26,126,113	18,977,066	45,103,179
Italy	408,742	11,494,047	11,902,789
Japan	98,939,679	65,952,948	164,912,627
Russia	931,462	4,105,272	5,036,734
Singapore.			
Straits Settlements, etc	7,869,764	2,948,638	10,818,402
United States	40,150,094	56,995,460	97,145,554
All other countries .	4,193,498	5,851,550	10,045,048
Total	\$256,456,713	\$240,139,975	\$496,596,688

Chinese foreign trade may be indicated in haikwan taels, which had an average value of \$.62 in 1915, \$.83 in 1916, and \$1.19 in 1917, the value fluctuating with the price of silver. The imports for 1917, in haikwan taels were: opium, 6,241,992; cotton goods, 158,950,267; woolen goods, 3,676,815; metals, 25,137,741; rice, 29,584,093; cigarettes, 31,263,027; coal, 15,041,834; fish, 14,144,735. The exports for the year 1917 were: yellow beans, 15,274,479; bean cake, 23,758,075; raw cotton, 20,035,862; oils, vegetable, 29,721,732; silk, raw and mfd., 79,148,603; cow and buffalo hides, 17,357,572; tin, 12,204,-

877; tea, 22,107,687. The share of the British Empire in the foreign trade of China was 27.81 per cent; Japan 43.05 per cent; Russia, 6.83 per cent. The net imports in pounds sterling for 1917, were 119,072,400. For 1916, they were 86,067,833, while the exports for 1917 were 110,301,853, and for 1916, 80,299,561. There has been an increase in the exports of wheat and salt, also, more bristles were exported in 1918 than in 1913 or in 1917. Kerosene, both American and Japanese, appears as nil in the net foreign imports, owing to the excess of re-exports over gross imports. Japanese cigarettes have recovered from the slump of 1917 but their increased sale is more an indication of the greater number of Japanese residing in the provinces than of victory over competing brands. Emphasizing the effect of the exchange, the following statistics of the trade of the port of Chefoo for the year 1918 as compared with 1917, are submitted, with values stated in United States currency; although these amounts, when stated in haikwan taels, show a steady decline, an increase is shown when they are converted into United States currency:

Imports and exports	1917	1918
Imports of foreign goods:		
From foreign countries .	\$9,134,178	\$7,594,669
From Chinese ports . .	3,457,582	3,821,371
Total foreign imports .	\$12,591,760	\$11,416,070
Reexports of foreign goods		
To foreign countries . .	\$498,915	\$351,855
To Chinese ports . . .	4,198,886	4,326,216
Total foreign reex- ports	\$4,697,801	\$4,678,101
Net total foreign im- ports	\$7,893,959	\$6,737,969
Imports of Chinese products	\$10,736,608	\$12,119,756
Reexports of Chinese prod- ucts:		
To foreign countries . .	\$263,090	\$261,193
To Chinese ports . . .	1,137,327	1,010,559
Total Chinese reex- ports	\$1,400,417	\$1,271,752
Net total Chinese im- ports	\$9,336,191	\$10,848,004
Exports of Chinese products of local origin:		
To foreign countries . .	\$3,579,535	\$5,211,365
To Chinese ports . . .	12,068,402	13,959,873
Total exports of local origin	\$15,647,937	\$19,201,238
Gross value of the trade of the port	\$38,976,305	\$42,737,064
Net value of the trade of the port	\$32,878,087	\$36,787,211

It was apparent that American manufacturers and exporters of cordage were not supplying a very large part of the demand in China. In 1918 only about \$20,000 worth of the total cordage import, valued at over \$800,000, was furnished by the United States. In iron and steel products the United States, Great Britain and Japan in the order named, were supplying the demand. Among the matters on which resolutions were formulated, as a result of discussions at a recent meeting of the British Chamber of Commerce in Shanghai, were: That the policy of the open door should be reaffirmed; that there should be an international agreement for the abolition of the spheres of influence and

for the development of the Chinese railways, under efficient management; urging the Chinese government to establish a uniform currency of dollars and subsidiary silver and copper coins; that the promulgation of a law protecting trademarks and copyrights used in China should be expedited; that the establishment of stable government, a satisfactory code of laws and arrangements for the effective administration of such laws are necessary preliminaries to the abolition of extra-territoriality; that guarantees should be obtained from the Chinese government that no other form of inland taxation shall be substituted for "likin" if that tax is removed in return for an increase in the import duties; urging the British government to remit a portion of the Boxer indemnity in order to aid British educational institutions in the Far East, that the British government should give immediate effect to the various measures agreed upon by the International Opium Convention in 1912 without waiting for their ratification by other countries, that British firms in China should provide their staffs with facilities for learning the Chinese language; that an organization should be subsidized for the development of British publicity work in China through the diffusion of general and commercial news.

SHIPPING. During 1917, 213,473 vessels of 86,907,049 tons, entered and cleared Chinese ports. Of these, 3609 were American; 34,902, British; 328 French, 233 German. At this time there were also 87 steamships engaged in Chinese coastwise trade, of which 27 were Chinese-owned, and of the 1077 vessels, with an aggregate tonnage of 76,425 in inland waters, only one-fifth were owned by the Chinese. Chinese coastwise trade in 1917 gave a total of 72,055 entries of 32,418,225 tons, and 73,775 clearances of 32,362,879 tons. These were, in order of their amount, as follows: Chinese, British, Japanese, American, and Russian.

RAILWAYS. In 1919 there were 6000 miles of railway open to traffic in China (including 1857 miles in Manchuria) of which about 1300 miles had been constructed by British enterprise and British capital. There were 2273 miles under construction in 1917-18. The receipts from all the railways for the first half of 1917 amounted to 6,764,176 pounds sterling. The following information was supplied by the United States Bureau of Foreign and Domestic Commerce on December 11th: Railway construction has been in abeyance since 1914, and although conditions at present are too unsettled to promise any immediate resumption on a large scale, plans have been laid for several extensive schemes. Consequently, a brief review of the proposals already mapped out in Southwest China should be of interest to investors, railway contractors, and manufacturers of railway material.

Railway construction south of the Yangtze has not, up to the present, kept pace with that in North China, where there are few navigable waterways. In the South, on account of many excellent rivers, the need has not been so urgent. The railways south of the Yangtze already constructed or under construction are:

(1) Shanghai-Nanking Railway.—Connected through the Tientsin-Pukow Railway with the railway systems of North China. Length 204 miles. (Completed.)

(2) Shanghai-Hangchow Ningpo Railway.—Length 218 miles. (Completed from Shanghai

to Hangchow, 118 miles, and from Ningpo to Pokwan, 60 miles, and a mile or two from Hangchow toward Pokwan.)

(3) Hangchow-Amoy (Changhsia) Railway.—Length 20 miles. (Completed.)

(4) Swatow-Chachowfu (Chaoshan) Railway.—Length 26 miles. (Completed.)

(5) Canton-Kowloon Railway.—Length 111 miles. (Completed.)

(6) Sunning Railway.—Towshan to Kongmoon. Length between 80 and 90 miles. (Completed.) Extension from Sunning to Yeung-kong has been partly constructed and a branch to Canton has been surveyed.

(7) Canton-Hankow (Yueh Han) Railway.—(Partly constructed.)

(8) Canton-Samshui Railway.—Length 30 miles. Branch of Canton-Hankow Railway. (Completed.)

(9) Yunnan Tongking Railway.—From Yunnanfu to Haifong. Length 634 miles, of which 289 are in China. (Completed.)

(10) Nanchang Railway.—Kiukang to Nanchang. Length 80 miles. (Completed.)

(11) Changsha-Chuchow-Pinghsiang Railway.—Length 65 miles. (Completed.) The Changsha-Chuchow section, length 33 miles, is to become part of the Canton-Hankow Railway.

It is advisable to remember that the railways already in existence have wrought remarkable changes in the habits and industry of the people. Regions which are not accessible to and have not been opened up by railways form an interesting contrast in this respect. Lack of easy communications has caused each district to grow all its own requirements, and the interchange of commodities grown in different districts has been limited. It is not to be expected, therefore, that a new railway would be immediately remunerative in provinces such as Yunnan and Kweichow, which have always been handicapped by lack of communications. But experience in North China shows that the Chinese are not slow to see the advantage of growing in each district the crops most suitable to that district and interchanging them for the produce of other districts. The provision of good means of communication is also likely to lead to the growing of produce on land at present unproductive, and to a more intensive cultivation, and possibly to the introduction of irrigation schemes. The building of railways is conducive to industrial development, and possibly to mining development, in both Yunnan and Kweichow, thus providing freight for new railways. Moreover, the railways run through well-populated country, and an immediate passenger traffic is assured. Within the next 25 years it may be expected that 50,000 or even 100,000 miles of railway will be built, linking up all the principal ports of China. The Canton-Samshui line earns approximately £4,500 (say \$22,000) per mile per annum despite steam-launch competition. Connected with the schemes of railway construction in the Canton district is the project for making a deep-water port 10 miles between Canton and Samshui and connecting the latter port with all the railways running to Canton.

During 1919 a statistical summary was published anticipating the annual report for 1918 of the Ministry of Communications. The financial results for the year were extremely satisfactory as indicated below:

	1918	Compared with 1917	
		Increase	Decrease
Operating rev....	\$77,652,153	\$13,778,449
Operating exp....	84,822,615	4,282,051
Net operating revenues	\$43,324,538	\$9,496,399
Income debits....	\$11,033,562	\$2,269,878
Income credits....	1,209,144	108,647
Net income deb.	\$9,824,418	\$2,378,525
Surplus for the year	\$33,505,120	\$11,874,924

The item of operating expenses contains \$1,777,422 for depreciation of rolling stock. The operating ratio was slightly over 44, compared with 47 in 1917 and 52 in 1915. Net operating revenues represent a return of 10.4 upon the cost of road and equipment, and were sufficient to cover net income debits more than four times. The surplus for the year was equivalent to 29 per cent upon the funds which the government had invested in the properties out of its own funds. Out of surplus, \$3,967,487 was invested in Additions to Property and \$1,617,811 was used in retiring funded debt. By these means and the investment of other funds, the government equity in the property was increased during the year by \$7,644,488.

The report shows an increase in the length of line by 28 kilometers only. Seven locomotives were purchased and 21 freight cars were constructed. In addition, 200 freight cars were leased upon a more or less permanent basis. Locomotive performance increased from 43,772 kilometers per year to 47,512. Passenger coach performance increased from 97 passenger kilometers per seat per day to 103, and freight car performance, measured in "ton kilometers per ton of carrying capacity per running day" increased from 49.1 to 64.5. Average train load showed an increase from 244 to 257 long tons. Train load showed a consistent increase since the first statistics were compiled. Also the average haul per ton had been steadily increasing, from 165 kilometers in 1917 to 184 in 1918. In 1915 this figure was 141 kilometers. Passenger traffic exhibited similar tendencies.

The season of 1918 was remarkably favorable for a good showing and a similar improvement in 1919 could not be expected, but estimates indicated that the 1918 figures would be exceeded comfortably in 1919.

FINANCE. The silver dollar (yuan) is the monetary unit, and is equivalent to .644+ of the haikwan tael. The haikwan or customs tael is a unit of weight, varying with the price of silver, and is somewhat heavier than the various local taels. The British and Hongkong silver dollars are current in the country. To continue the war against the South, the Tuan Chi-jui administration borrowed in reckless amounts from Japanese sources. This made the discreditable conditions generally associated with national finance in China even worse in 1919, though things were expected to improve under the republican administration. The national budgets compiled in the last 20 years, and published at irregular intervals, left much to be desired, and even now, the amount of public revenue is not definitely known. The following statements represent official estimates in dollars: Revenue for 1916, 472,838,584; expendi-

ture, 472,838,584. In 1913, the revenue was 333,943,482 dollars, and the expenditure 642,237,076, leaving a deficit of 308,288,594 dollars. Duties were fixed in the autumn of 1918 at specific rates calculated on a basis of 5 per cent of prices ruling during the period from 1912 to 1916 inclusive. The Entente powers agreed to postpone payment of "Boxer Indemnities" for five years from Dec. 1, 1917. In 1918, £9,603,908 were collected for Chinese customs. The foreign debt secured on imperial revenue outstanding Dec. 1, 1916, amounted to £171,976,000. The debt has since been increased by over 200,000,000 yen, borrowed from Japan, in addition to many secret loans, of which little is known.

FINANCIAL AGREEMENT. An agreement in respect to Chinese loans was effected at Paris on May 12th by American, French, British, and Japanese bankers. Provision was made for the entry of Belgium later. Acting upon a suggestion from the United States they decided for a combination of these banking groups for the making of financial, administrative, and industrial loans to China.

DEFENSE. Exact information in regard to the strength of the Chinese army is not at hand, and cannot be obtained. Plans for the creation of a modern army, made in 1905 and 1906, planned the formation of 36 divisions in the provinces, with a strength of 10,000 each. The revolution in 1911 did not allow these plans to be completed. It was reported in 1916 that the War Office was in control of 204,000 men under arms, and that the rather independent provincial generals had at their disposal about 337,000 men. Under the pretext of forming an army to take part in the war, the War Participation Bureau was organized. It has accomplished little other than to increase the danger from militarism in China. The navy includes the protected cruiser *Hai Chai* (4300 tons and 24 knots), three protected cruisers, each of 3000 tons, and of 19.5 knots speed; two protected cruisers of 2600 tons each, and various small craft. There are no naval bases of any importance, but the formation of several is contemplated. Existing dockyard facilities are obsolete and inadequate, but there are some building and repair facilities.

GOVERNMENT. The executive head of the government is the president. There is a vice-president and a legislature of two houses, the Senate containing 264 members, and the House of Representatives, 596 members. Nine members compose the cabinet, and its premier is nominated by the president, the other members being appointed by the premier with the approval of the president. The president in 1917 was Li Yuan-hung, who since the previous year had been involved in the struggle with the cabinet of Tuan Chi-jiu over constitutional differences. Tuan's policies received the support of the northern generals, and the president was obliged to dissolve Parliament in June. In the following month, a great and unsuccessful effort was made to restore the monarchy. Tuan became again Premier and Feng Kuo-chang became acting-president. During this time an independent military government was set up at Canton, under Dr. Sun Yat Sen.

The president, Hsu-shih-chang, was elected to office Aug. 10, 1918, and was inaugurated Oct. 10, 1918. The cabinet appointed January, 1919, was composed as follows: Premier and Minister of the Interior, Ch'ien Neng-hsün; Minister of

Foreign Affairs, Lou Tseng-Tsiang; Minister for War, Chin Yun-P'eng; Minister of the Navy, Liu Kuan-Hsung; Minister of Finance, Kung Hsin-Chan; Minister of Education, Fu Tseng-hsiang; Minister of Justice, Chu Shen; Minister of Communications, T'sao Ju-Lan; Minister of Agriculture and Commerce, T'ien Wên-Lieh, and Chief of General Staff, Chang Huai-Chih. See ROCKEFELLER PHILANTHROPIC BOARDS.

HISTORY

RELATIONS WITH JAPAN. On Feb. 14, 1919, China was informed by Japan that if she accepted Japan's demands at the Conference and did not reveal secret agreements with Japan the latter Power would pay the balance of the loan to China amounting to 17,000,000 taels. Otherwise Japan would insist upon immediate repayment of the 3,000,000 taels already loaned. On March 15th the agreements between China and Japan were made public. These consisted of three notes exchanged between China and Japan on Sept. 24, 1918, which supplemented the treaty and notes of May, 1915. They named new railways for Japanese capitalists to finance in China proper, as well as in Manchuria and Mongolia; specified railways in Shantung which the Japanese might finance in order to connect them with the main lines of north China, and laid down the conditions under which the Japanese might coöperate with China in the affairs of Shantung. Meanwhile by the treaty of 1915 China had bound herself to recognize all matters that might be agreed upon between the Japanese government and the German government respecting the disposal of all rights and interests and concessions possessed by Germany in Shantung. After this treaty was signed the Japanese government announced that the territory of Kiao Chow would be returned to China on condition that its bay should be open as a port and that the municipal concessions should be under exclusive Japanese jurisdiction. Other concessions were granted by China and the lease of Port Arthur was extended.

The representatives of China at the Peace Conference were as follows: Lu Chiang-tsang, High Commissioner; Chen Ting Thomas Wing, ex-Minister of Agriculture; Hu Weh-teh, Minister at Paris; Alfred Sze, Minister to London, and Dr. Wellington Koo, Minister to Washington. Relations with Japan became strained soon after the opening of the Conference, owing chiefly to the Shantung affair and the resolve of the Chinese delegates at Paris to publish the secret treaties. The Chinese delegation declared that Japan was seeking to dominate China and in proof of it they alleged an attempt of Japan to secure the right to represent China at the Peace Conference. They said that to this end the Japanese Foreign Minister in November, 1918, had asked that Japanese advisers be allowed to aid China in formulating the proposals to be laid before the Conference; also that the Japanese had warned the Chinese delegates not to disclose the secret treaties and that copies of these treaties had been stolen from their baggage while they were passing through Japan on the way to Paris. These charges were all denied. The Chinese delegates however published the secret treaties along with other Chinese-Japanese agreements. As noted under the **WAR OF THE NATIONS** the Chinese delegates re-

fused to sign the treaty on account of the clauses relating to Shantung. See **WAR OF THE NATIONS**.

CIVIL WAR. As noted in the last **YEAR BOOK** the new president, Hsu Chi-Chang who was inaugurated October 10th, declared the war at an end between the northern and southern provinces and made an appeal for union and peace. This appeal was followed on December 2d by a note from the Allied governments urging him to pursue his policy of reconciliation, and a similar note was sent by them to the Canton government saying however that its presentation did not imply the recognition of this government. Representatives from northern and southern China arranged a conference; but after it held many sessions it failed to come to an agreement and concluded on May 16th with a statement to this effect. The Allied Powers again intervened in August when a memorandum was addressed to the government by the United States, Great Britain, France, Italy and Japan, expressing their wish for an early settlement and the hope that war would not be resumed.

BOLSHEVISM. Reports of Bolshevik propaganda in China were reported during the year, as elsewhere in the East. There was frequent reference to the activities of the Reds on the Mongolian-Siberian frontier and it was reported at Peking toward the end of the year that the Bolsheviks had asked the Chinese to send them an authorized representation. They were said to have proposed to the Peking government to open negotiations in respect to the return of the Chinese Eastern Railway.

CHINDA, VISCOUNT. Japanese representative at the Paris Peace Conference. He was at that time Ambassador to London. His first important position was that of vice-minister for foreign affairs during the Russia-Japanese War. He had a long and distinguished diplomatic career, having been minister to Brazil, the Netherlands, and Russia, Ambassador to Germany, 1908-11, to the United States, 1911-16, and to London, 1916—.

CHORAL SOCIETIES. See **MUSIC**.

CHOSEN. See **KOREA**.

CHRISTIAN ENDEAVOR, UNITED SOCIETY OF. Founded in 1881 for the purpose of training young converts for church membership, this is an interdenominational society of young people. Statistics for 1919 show 77,657 societies, of which there were 51,268 in the United States, 4118 in Canada, and 22,181 in foreign countries, besides 65 floating societies, and 25 army societies. Comrades of the Quiet Hour and the Tenth Legion are other societies connected with Christian Endeavor. Comrades of the Quiet Hour numbered in 1919, 174,545, and members of the Tenth Legion numbered 52,754. Life-Work Recruits numbered 4974.

The International Christian Endeavor Conference was held for the first time in four years at Buffalo, N. Y., Aug. 5, 1919. The programme for the coming years was laid out by the president, Rev. Francis E. Clark, consisting of five main points: (1) a 50 per cent gain in membership within two years; (2) the organization of a society in every church in the country; (3) a definite goal in every State for denominational missionary gifts; (4) a field-secretary for at least part time in every State and Province; and (5) a sustaining alumni association in every union. Associate President Daniel A. Poling,

reported on the work of the Society during the war, showing that Christian Endeavor had been of great help in relieving the suffering in the war areas of Europe. More than \$200,000 was received by the committee, with virtually no appeal to the public, while secretarial services were rendered free. The Society has been active in preparing the country for prohibition. During the year 53 alumni fellowships were organized with a total annual pledge for the world programme of more than \$13,500. The report of William Shaw, General Secretary of the Society, shows the progress of the work in foreign countries. "What is true of the United States is equally true of foreign lands. Mexico and South America are stretching out eager hands for Christian Endeavor. We face a challenging opportunity in all parts of Latin America. England and Scotland have put secretaries in their home field, and have started campaigns for more than \$50,000 adequately to finance the work. From the great mission field of India, Africa, China, and Japan come most encouraging reports and requests for enlarged resources that the opportunities may be more adequately met." The officers of the Society in 1919 were: President, Rev. Francis E. Clark; president associate, Daniel A. Poling; general secretary, William Shaw; and treasurer, A. J. Shartle. Headquarters are maintained at 41 Mount Vernon St., Boston, Mass.

CHRISTIANS. A denomination, with churches in the United States and Canada, founded as a part of the great movement for religious liberty which marked the eighteenth century, and which has been the spirit and purpose of the church since then. Administration is carried on by the American Christian Convention, meeting quadrennially, composed of delegates from 71 conferences, of heads of schools and colleges, and officers of the convention and its general enterprise. To the last quadrennial convention (1919) were reported 105,310 communicants, 1204 churches, 957 ministers, and 963 Sunday schools, with 76,055 pupils. The publishing house is known as The Christian Publishing Association, Dayton, Ohio. National headquarters of the denomination are located there also. The educational institutions have been decreased by two, but the remaining ones have been better equipped, and more thoroughly organized for service: Palmer Institute and Starkey Seminary in New York; Elon College in North Carolina; Defiance College in Ohio; Union Christian College, in Indiana; Palmer College in Missouri; and Jireh College in Wyoming. Elon College and Defiance College have just increased their endowment by half a million dollars each.

The church has recently undertaken what is known as *The Forward Movement*, which has for its task the emphasizing of Devotion, Evangelism, Religious Education, Missions, and Benevolence. The financial goal is \$2,000,000.

Missionary work is carried on in Japan and Porto Rico, and was expanded during 1919. During the war the church had an active War Work Commission, and also a committee to recommend chaplains. The Commission raised several thousand dollars for use in relief work. The official organ of the denomination is the *Herald of Gospel Liberty*, while the *Christian Missionary* is the official organ of the Department of Missions.

CHRISTIAN SCIENCE. The annual meeting of The Mother Church was held in Boston, Mass., in June, 1919. Reports received showed that the progress during the year had been very favorable. Dr. Francis J. Fluno, the retiring president, was unable to attend the meeting, due to transportation difficulties between Honolulu and San Francisco, but Mr. Bucknell Young, the First Reader of the church, presided in his place. Officers elected for the following year were as follows: President, John W. Doorly, of Leeds, England; treasurer, Edward L. Ripley; and clerk, Charles E. Jarvis. President Doorly gave an address on the ideals of Christian Science, after which he announced the adoption of a resolution for the formation of the Committee on General Welfare, consisting of one member from each of the following cities: New York, Chicago, London, Los Angeles, Kansas City, Minneapolis, and Washington. Headquarters are to be opened in Boston. The Committee "shall have power to make such inquiries into the affairs of the Mother Church as the committee may decide, and it shall make such report or reports to the members of the Mother Church as it may determine." The treasurer's report for the year ending June 1, 1919, showed total receipts in the General Fund, \$774,256; Real Estate Fund, \$90,575; War Relief Fund, \$1,129,335; Christian Science Benevolent Association, \$644,219; and of the \$6840 of the Busy Bee Trust Fund, there remained at the end of the year \$2604. The membership of the Mother Church continued to increase, the admission on May 30th being the largest, with but one exception, in its history. Many new branch churches and societies were organized during the year, including those at Calcutta, India; Winterthur, Switzerland; Utrecht, Holland; and Cardiff, South Wales. There were 6289 practitioners registered in the *Christian Science Journal* during the year, a considerable increase over last year. Although inconvenienced by restrictions imposed by war and other conditions, members of the Board of Lectureship of the Mother Church delivered during the year in different parts of the world a total of 2029 lectures to audiences aggregating 1,522,856 persons. Lectures were given in China, Japan, the Philippine Islands, Australia, New Zealand, Hawaii, Alaska, Yukon, Canal Zone, France, Switzerland, and for the first time, a lecture was given in Christiania, Norway.

During the year Christian Scientists obtained a change in the school law of North Carolina to the effect that "no pupil or minor shall be compelled to submit to medical examination or treatment whose parent or guardian objects to the same."

The War Relief Committee continued active operations between June 1, 1918, and the signing of the armistice. A second party of 12 workers were sent to France, where nine relief depots were opened, where the healing ministrations of Christian Science were made available to those men in the American Expeditionary Force who cared to call for such help. Much literature was distributed through these depots. The Comité Français de la Christian Science pour les Secours de Guerre, formed of members of the Christian Science churches in Paris, continued its work of extending help from the War Relief Fund to refugees and others in France. One chaplain was appointed in the navy, and, after a change

in the army regulations, 10 chaplains were appointed in that branch of the service, six of whom were still in active service in June, 1919.

Reports from Perth, Western Australia, and Stockholm, Sweden, show great progress during the year, persons traveling hundreds of miles to attend Christian Science lectures in those cities. In London the total number of copies of *Science and Health* sold was 1759, being an increase of 417 over the preceding year, and also 11,276 copies of the *Quarterly*. The total number of periodicals distributed was 562,685, being an increase of 102,573 over the preceding year. The year was marked in Paris by the appearance of the French translation of *Science and Health*, followed by *Le Héraut de Christian Science* and translations of *Rudimental Divine Science* and *No and Yes*. The rapidly growing interest in Christian Science in France has been evidenced by the large number of letters of inquiry coming from every quarter of the country. Reports from various parts of Germany are encouraging, although the work has been seriously hindered by the war.

The Christian Science Publishing Society in Boston publishes the *Christian Science Sentinel*, *Christian Science Journal*, *Christian Science Quarterly*, and *Christian Science Monitor*, besides 67 pamphlets on various phases of Christian Science.

CHRISTMAS ISLAND. An Indian Ocean Island, 200 miles southwest of Java, whose large deposits of phosphate of lime are mainly responsible for its importance. It has an area of 43 square miles, and is nine miles long. Most of the population is engaged in the exploitation and development of the phosphate of lime deposits. Phosphate exports in 1916, 44,209 tons; in 1917, 89,889 tons. Tonnage entered and cleared in 1915, 21,852 tons; in 1916, 28,658 tons. There is an island railway. Politically, the island is connected with Singapore.

CHROMITE. Chromite, one of the most important war metals, finding an extensive use as an alloy in hardening steel in munitions manufacture, showed a greater production in 1918 than in any preceding year. Compared with 1917, there was an increase of 88 per cent in quantity and 275 per cent in value.

Besides the use of chromite in munitions manufacturing, it is used in the production of bichromite of soda, bichromite of potash, chromic acid, and chrome alum, which are used in the preparation of dyes and pigments for tanning leather.

CHUBUITE. See MINERALOGY.

CINCINNATI, UNIVERSITY OF. A co-educational municipal institution, located at Cincinnati, Ohio. In the summer session of 1919 there were 445 students, and in the autumn there were enrolled 3476 students. The faculty numbers 350. The productive funds amount to \$1,372,984 and the income for the year was \$78,155. The library contains 92,000 volumes and 15,000

pamphlets. The university was founded in 1871. President, Charles William Dabney, Ph.D., LL.D.

CITY GOVERNMENT. See MUNICIPAL GOVERNMENT.

CITY MANAGER. See MUNICIPAL GOVERNMENT.

CITY PLANNING. In both planning and carrying out plans progress centres in (1) remedying the ills that come through lack of comprehensive city planning and (2) in zoning, or dividing cities into use, height, and area-of-lot-occupied districts. Most of the replanning thus far being executed is designed to provide main thoroughfares proportioned to carry the traffic which careful studies indicate they will have to bear in the future. This work consists chiefly of widening existing streets and of supplying needed links by opening new streets, usually for short distances. Zoning, as now being practiced, is a fundamental of city planning, both for (1) the protection of property and the comfort and convenience of the people and (2) for the systematic planning of street systems, transportation facilities and other utilities, and other controlling factors in city life, growth and service, for wise planning is impossible unless it is known whether a section of the city is to be used for residence, business or industrial purposes, how high the buildings will be, and what percentage of the lots will be built upon. Heretofore, such city planning as has been done has dealt for the most part with single elements of the city plan. This has been due in large part to lack of coördination between the different branches of the city government and particularly to the decentralization of the engineering work of the city and the inferior authority generally vested in its engineering departments. The attempts thus far being made to rectify this lack of coördination are mostly through city planning commissions. These rarely have power to ensure that their recommendations will be carried out, or money to employ engineers and other planning experts to make the necessary studies. In fact, it would be difficult, from the governmental viewpoint, to give planning commissions such power without undermining the authority of the governing body of the city. The most promising type of city planning commission, therefore, is one that is tied well into the city government on its technical administrative side, has citizen members of weight and ability for its task, and is empowered to employ full time experts and, when occasion arises, outside consulting experts in city planning. The recommendations of such a commission have force on both the general citizenship and the city government. The number of commissions of this sort is increasing and new legislation is providing a way for still further additions. France has just joined the nations that give central supervision to city planning. The federal government of the United States has attempted nothing of the kind, and under the Constitution there would be difficulty in its exercising other than advisory or research functions. There is, however, nothing in the way of State supervision of city planning in the United States, but it has not yet been attempted, notwithstanding examples set by some of the Canadian provinces.

REPLANNING OLD CITIES. Chicago leads American cities in its work of rectifying an unplanned city or one that has grown in haphazard fashion. In addition to large sums previously provided

for increasing the traffic capacity of some of its main thoroughfares in accordance with a comprehensive plan worked out some years ago, the voters in November authorized, two to one, bond issues totalling \$28,600,000 for widening and in some cases double-decking six streets. For the costliest project \$9,200,000 was voted to be spent on Robey Street, which is now entirely blocked at nine places while at 19 places its width varies from 30 to 100 ft. All the narrow places will be widened to 84 ft. Next in cost will be \$5,800,000 to give Ashland Ave. a minimum width of 100 ft. across the whole city. The avenue is now closed at four places and varies from 42 to 100 ft. in width at 28 places. On Ogden Ave. \$5,400,000 will be spent to provide a width of 108 ft. for 3 miles between Union Park on the north side and Lincoln Park and Lake Michigan on the west side, at the same time relieving the street congestion in the loop or central business district. The sum of \$3,800,000 was voted for providing a two-story way 135 ft. wide for a mile along the Chicago River between the two levels of Michigan Ave. and the natural level of Market and Lake streets. Western Ave., now 50 to 330 ft wide in its stretch of 26 miles, will be given a minimum width of 100 ft at a cost of \$2,400,000. For continuing work on Michigan Ave. \$2,000,000 was voted. This will complete the two-level street for about a mile north from the centre of the city, giving a direct thoroughfare between the centre of the city and the north side. Michigan Ave. has already been widened from 60 to 130 ft. from Randolph St. to the river and to 141 ft. from there to its connection with the North Shore Drive. The upper-and-lower improvement of Michigan Ave., said Charles H. Wacker, chairman Chicago Plan Commission (*The American City*, December, 1919), "will prevent 45,000 north-and-south bound vehicles from interfering with 15,000 east-and-west bound vehicles every day." The bond issues authorized in November, like two earlier ones of the same kind, represent only the city's contribution to the cost of street widening, which Mr. Wacker says will be double the bond issues. Street widening and opening at St. Louis, in accordance with the major street plan worked out by the City Planning Commission, made progress through the year. In midsummer, Pittsburgh voted \$1,410,000 to widen Second Ave. and \$2,000,000 for the Monongahela Boulevard, extending from that avenue along the north bank of the river. A large programme is being worked out at Detroit under the City Planning Commission provided for by the new city charter. Closely allied to street widening, and aiding the movement of street traffic, is the grade-crossing elimination that has been in progress in many cities for years past—notably in Chicago, where vast sums have been spent by the railways and the city to separate railways and roadways. A tentative grade-crossing elimination plan for Detroit, looking 15 years ahead, has been laid out by the engineering and public works departments of the city through a Division of Grade Separation and Bridges, created in 1917, with an engineer locally in charge and with the aid of a consulting engineer from the University of Michigan. The estimated cost of the plan is from \$35,000,000 to \$50,000,000. Since 1900 some 40 grade crossings have been eliminated, making 58 separations of railways and highways, but there remain 245 crossings at

grade. On the basis of actual counts it is estimated that a million street cars and other vehicles pass over these grade crossings each year. This hinders traffic and thus handicaps business and industry, besides its inevitable risk and loss of life. (For detailed résumé of the Detroit grade elimination scheme, see *Engineering News-Record*, March 31, 1919.)

ZONING. For a city of 35,000 the zoning ordinance adopted by Alameda, Cal., in February, 1919, seems elaborate, but it is the result of careful studies by a consulting city planning expert who conducted 40 hearings in as many neighborhoods in order to ascertain local feeling on the subject. The zoning plan was also endorsed by the local Advisory Planning Commission and the City Manager. The ordinance, which governs new building permits only, establishes 8 use, 4 height, and 3 area or light-and-air districts. Of the use districts, Class 1, in which only one-family houses are permitted, covers about two-thirds of the residence area of the city, while Class II covers residences of any kind that are separate from stores. There are three classes of business-and-public-use districts and two classes of industrial-use districts, one of these two being for obnoxious and odor-producing industries. The latter is so located that the prevailing winds are away from the city. The four height districts cover buildings 2½, 3, 4, and 5 to 8 stories high. There is no height limits for towers, tanks, chimneys, spires, etc., covering not over a third of the lot on which they are built. To conserve air and light, the area of the lot that may not be built on in the four area districts ranges from 50 per cent in the "home area" or a single-family residence district to 5 per cent in the two industrial-use districts. At the close of the year Newark, N. J., appeared to be on the point of adopting a zoning ordinance which may be accepted as an earnest attempt to embody and improve upon the best of what has been worked out in other cities, with variations to meet local conditions. The ordinance creates 4 use, 5 height, and 5 area districts. The use districts are subdivided into (1) residence, (2) business (3) industrial, and (4) heavy industrial. Residence districts may also include hotels, churches, schools, libraries and other public and semi-public buildings other than correctional institutions; also railroad passenger stations, and buildings incident to farming and gardening. From the business district there are excluded blacksmith shops, milk bottling or distributing stations, carpet- and dry-cleaning works and various other specified industries, besides all trades and industries excluded from the industrial district. From the industrial district 36 specified noxious or offensive industries, made such by the emission of odor, dust, smoke, gas, or noise, are excluded. The heavy industrial district is reserved for any and all industries excluded from the other three but may also include those allowed in Class I except it may not contain any dwelling or tenement house. The five height districts restrict buildings to heights of 35, 50, 85, 125, and 150 ft., the actual heights in the 150-ft. district being governed by the street widths. There is no height limit on spires, steeples or grain elevators, and towers and tanks are allowed on industrial buildings. The classification of area districts governs the relation between total area of lots and area built upon, taking into account

rear yards, side yards, and inner courts, and specifying the number of families that may be housed within certain areas. The enforcement of the Newark zoning ordinance is entrusted to the superintendent of buildings and the inspector of combustibles and fire risks. Appeals may be made to a board consisting of the two officers just named, the chief engineer of the Department of Streets and Public Improvement, the health officer, and the president of the Board of Assessment and Revision of Taxes. The ordinance is not retroactive. Zoning investigations at Yonkers, N. Y., were well started in December. The general scheme of use districts proposed was to have two residential and two industrial districts. At Philadelphia, Detroit, and Cleveland, the city planning commissions were at work on zoning problems and a zoning bill for the District of Columbia was introduced in Congress. The new city planning law for Oregon, outlined further on in this article, provides for zoning. Finally, it may be noted that the practice of holding neighborhood meetings to discuss zoning schemes, has been followed in Pacific Coast cities, but is not common in other parts of the country, although general hearings, at some central point, seem to be the rule.

PUBLIC SUPPORT. To secure the public interest and backing essential if plans acceptable to the people are to be made and once made are ever to get beyond the "paper" stage, citizens' committees and joint committees representing civic and commercial organizations have been created in a number of cities. Such committees work for the establishment of official city planning commissions or give their support to existing commissions. Notable for its breadth is the Philadelphia City Planning Conference, organized late in 1919 through the cooperation of the local Engineers' Club, the local chapter of the American Institute of Architects, the Art Society and City Park Association and a score or more of other organizations. The proposed cooperative work is directed by an executive committee. Earlier in the year a Citizens' Committee on City Planning was organized at Pittsburgh. It has since appointed a consulting engineer. It will cooperate with the existing city and county planning commissions. In Texas, cooperative work was started at both Dallas and Fort Worth. The Dallas Chamber of Commerce and the City Planning Commission, working through the Metropolitan Development Commission, are trying to unite "all the Dallas business and civic organizations to meet properly the demands" caused by the rapid growth of the city "by undertaking a comprehensive, far-sighted programme of practical city planning." To this end the raising of a fund of \$35,000 annually is proposed to maintain a permanent office and employ "experienced city planning experts."

REGIONAL PLANNING. That comprehensive planning for a city should reach beyond its boundaries is well understood by engineers, and other city planners, and has been recognized in State and provincial planning legislation in the United States and Canada by giving planning authorities jurisdiction over the layout of new subdivisions for a few miles beyond the city limits. A still broader phase of the subject was considered at the Niagara Falls City Planning Conference, held in May, when a group of papers on regional planning (*Engineering News-*

Record, June 5 and 12, 1919) was presented. The principles applicable to planning for a group of related municipalities and the intervening rural districts are similar to those for a single city, but their application is more complex on account of the necessity for harmonizing the governmental organizations of the several communities and apportioning the financial obligations among the cities and towns composing a regional planning district. Summing up a paper on "Some Engineering Problems of Regional Planning," read at the conference, Morris Knowles, Pittsburgh, Pa., said: "The great engineering problem of regional planning is the comprehensive planning of all of the features with consideration of their relation to one another, so as to secure the greatest good at the lowest possible cost. Steam transportation must be developed without reference to or in unnecessary competition with electric and water transportation. Main highways must not be planned solely with a view to carrying through traffic—if, for example, a slight modification of the location of a boulevard would provide a right-of-way for a trunk sewer and avoid the condemnation of expensive additional property, it would be indefensible to fail to consider it. Sewage outlets must not be located without reference to water intakes. Stream regulation must not be studied for one purpose only, but consideration must also be given to water transportation, flood prevention, water-supply, sewage dilution and power development, so as to secure that combination of results which represents the greatest good per dollar spent for the entire region."

LEGISLATION Oregon joined the States which have given their municipalities city planning powers. This it did by passing three laws. One makes possible an advisory city planning commission in every city and town of the State, with veto power on plots of new subdivisions—not only within the municipal limits but also six miles outside. A second law authorizes zoning by ordinances passed by city councils, but where there is a planning commission the council must require the commission to recommend the boundaries of the zones or districts and also the zoning regulations, and the council cannot take final action on zoning until the commission has filed its report. The third Oregon law establishes city council procedure for establishing building setback lines. *French City Planning Law.* The first general city planning legislation in France was enacted in 1919. It provides that within three years of the promulgation of the law city planning schemes must be in force in (1) every city of 10,000 or over; (2) all communes in the Department of the Seine; (3) all cities of 5000 to 10,000 population that show more than a 10 per cent growth between two successive quinquennial censuses; (4) settlements of any size whatever having a picturesque, artistic or historic character and listed as such by the departmental commission on natural sites and monuments. Any city planning scheme must establish the direction, character and width of streets, the location, area and character of squares, parks, etc., and the sites of future public buildings, utilities and other services. Any scheme must also lay down a programme of hygienic, archaeological and "aesthetic servitudes" and make provisions for drinking water, sewers and the disposition

of wastes. In each geographical department of France there must be, the law provides, an advisory planning commission; and at the Ministry of the Interior there shall be a superior planning commission of 30 members, ex-officio and appointed. This commission is to establish rules and regulations and give advice on all planning schemes, either of its own motion or on reference to it by the Minister of the Interior or the minister in charge of "liberated regions." When a planning scheme has been drawn up it shall be submitted to (1) the municipal council; (2) a hearing before the Council of State or other authority as required in expropriations; (3) the departmental planning commission. After this, the municipal council shall give its decision, which then goes to the state council or other state authority for final action. Approval takes the form of a declaration that the plan is a public utility. (For a few more details, see *The American City*, November, 1919). *Results in Bombay*. Under the Bombay Planning Act of 1915, the first legislation of the kind in India, 10 town planning schemes have been presented to the authorities. Six of these have been approved and some of the six have been executed. (For more detail, see *The Surveyor*, London, Eng., Dec. 12, 1919.)

WHAT CITY PLANNING IS AND IS NOT. A concept of city planning formulated by the Citizens' Committee on City Plan for Pittsburgh follows: "(1) Conformity to definite plan of orderly development into which each improvement will fit as it is needed—not the immediate execution of the whole plan. (2) Saving in cost of public improvements by business methods—not waste through unnecessary or extravagant expenditures. (3) Encouragement of commerce and facilitation of business—not the obstruction of any trade activity. (4) The development of an American city worthy of civic pride—not an imitation of London, Vienna or Paris. (5) Conservation of human energy and preservation of life, particularly child life—not merely restrictive, but also constructive welfare methods. (6) Correlation of the city's activities—not haphazard changes with no adequate returns. (7) The proper application of art to municipal improvements—not extravagant superficial beautification or vague attempts at civic adornment. (8) The rule of common foresight and prudence—not the rule of chance with ruinous expense and debt. (9) Preservation of historic buildings with their traditions—not the destruction of the old landmarks and city individuality. (10) Happiness, convenience, health, for all citizens—not merely expensive boulevards and parks for the few."

BIBLIOGRAPHY. Evans, *Town Improvement* (New York); intended as a citizen's guide; weak on water-supply and sewage disposal. *Garden Cities and Back to the Land* (London); a brief essay urging a combination of relatively small industrial towns and garden cities. See BUILDING.

CIVIC FEDERATION, NATIONAL. See NATIONAL CIVIC FEDERATION.

CIVILIAN RELIEF. See CHARITIES.

CIVIL SERVICE REFORM LEAGUE, NATIONAL. Organized in 1881, this is the only national organization devoted wholly to governmental administrative efficiency in the United States. The 38th annual meeting was held jointly with the Pennsylvania Civil Service As-

sociation at Philadelphia, April 11, 1919, at which addresses were given by Hon. Edward Keating, Hon. George R. Wales, Ethel M. Smith, Luther C. Steward, Hon. Martin A. Morrison, and Richard H. Dana, president of the League. As a result of an investigating committee into reported administrative abuses in Washington, a report was sent to President Wilson representing the incapacity of the Civil Service Commission and lack of comprehension of its task. The consequence was the reorganization of the Civil Service Commission, the President asking for the resignation of three Commissioners. The league continued its opposition to the "spoils" provisions of the 1920 census bill, especially the Veteran Preference Rider.

The Committee on Foreign Service made many important recommendations after very careful investigation, notably, that the age limit for entering the foreign service be reduced so as not to exceed 30 years; the salaries be increased; that embassies and consulates be purchased in the principal cities; that the State quota system of appointment be abolished; and that the Americanization of the consular service be completed by the appointment of salaried vice-consuls to act in the place of foreigners now serving as consular agents and clerks.

A noteworthy addition to the original programme of the League is that of applying the merit system to higher directing officials and injecting into the whole of the public service scientific business manager and efficiency experts. The officers during 1919 were: President, Richard Henry Dana; treasurer, A. S. Frissell; secretary, George T. Keyes; chairman of the council, Arthur R. Kimball.

CLAIRIN, JULES GEORGES VICTOR. French painter and illustrator, died at Belle-Isle-en-Mer, in France, in September. He was born in Paris in 1843 and studied in the Ecole des Beaux-Arts, where he was an intimate friend of Henri Regnault with whom he afterwards traveled in Spain and Morocco. Like Regnault he was much influenced by this journey in the choice of his subjects, many of which were taken from the people and countries of the East. He was classed among the last of the romanticists in French painting. Travels in Italy resulted also in the painting of many Italian subjects. He was famous as the friend and painter of Sara Bernhardt, having painted a well known portrait of the former in 1873 and later pictures of her in the rôles of Cleopatra and Phèdre. He was a friend of Charles Garnier and executed a number of decorative paintings for the Paris Opera, and Bourse, and the Casino of Monte Carlo. He was especially remarkable as a colorist and possessed also the gift of skill in precise drawing. Among his paintings may be mentioned: the "Benediction of the Swords," "Allah! Allah!," "The Two Hostile Tribes," "After the Victory," "The Massacre of the Abencerrages," "The Moorish Sentinel," "Entering the Harem," a portrait of Madam Krauss, and a portrait of Mounet-Sully as Hamlet (1889).

CLARK, GEORGE CRAWFORD. Banker, died at Aitken, S. C., Dec. 29. He was born at St. Louis, Mo., Aug. 3, 1845; graduated at the College of the City of New York in 1863 and became a member of the firm of Clark Dodge & Co., of New York, and on the board of several important financial institutions.

CLARK UNIVERSITY. A non-sectarian

institution for graduate study only, at Worcester, Mass. In the fall of 1919 there were 106 students and 21 members of the faculty. The productive funds for the year amounted to \$1,484,000 and the income was \$60,230. The library under separate endowment contained 85,000 volumes. The school was founded in 1889. President, Granville Stanley Hall, Ph.D., J.L.D.

CLASSICAL LITERATURE AND SCHOLARSHIP. See PHILOLOGY, CLASSICAL.

CLEARINGS, BANK. See FINANCIAL REVIEW.

CLEMENCEAU, GEORGES. Premier of France and French representative at the Paris Peace Conference. He was born in September, 1841, and passed through a varied career in his youth. He studied medicine, but was carried away by the Republicanism of the time, and on account of a manifestation against the second empire was sentenced to two months in prison. Before the war of 1870 he came to the United States where he earned his living as a writer for the press, and as a teacher in a girls' school, returning to France just before the Franco-German war. He took part in the National Assembly at Bordeaux and other events that followed the war. He is said to be the only living signer of the protest of the deputies of Alsace-Lorraine against annexation to Germany. He was member of the Chamber of Deputies from 1876 till 1893. In his political career he showed a Jacobin rigidity and hatred of compromise, and he was bitter against the spirit of opportunism which he found in the early years of the republic. He criticized the government as a mere machine for satisfying the bourgeoisie. His attacks upon the ministers were ruthless, and his power of invective won him the name of the Tiger while his success in overthrowing governments caused him to be called the Warwick of France. He made enemies of the extreme Nationalists by his vigorous onslaughts on Boulangerism, and he was a special mark for the attacks of Déroulède and other extreme nationalists. This enmity along with the irritation caused by his attacks on the Radicals for their timidity led to his leaving the Chamber where down to that time he had remained continuously, and during the next 10 years he expressed himself through the medium of the press. He fought on the side of Dreyfus with extraordinary effectiveness. In 1902 he was returned to the Chamber and he became Prime Minister and Minister of the Interior in 1906, his government lasting until 1909. During the war he was a bitter critic of delays and ineffectiveness wherever they were evidenced, and especially the policy of the government in dealing with the questions of supply and with defeatism in the rear. He proceeded aggressively to attack in his paper the various Bolo, Cailaux, Malvy, and other scandals of the time. In 1917 he stood before the public as the strong man of the day and in November of that year on the downfall of M. Painlevé he became Prime Minister. At once he displayed his characteristic energy and was believed by a large part of the French public to have been one of the chief figures in carrying on the war to success. His opponents have been among the extreme Left where he has been accused of reactionary policies.

CLEVELAND. See SEWEEAGE.

CLIFFORD, MARY. Philanthropist, died at

Bristol, England, in January. She was born in England, in 1843, daughter of an English clergyman, and at an early age began to work among the poor, and to interest herself in social problems. From her study of workhouse conditions, she acquired a wide knowledge of problems of poverty, and was engaged in extensive activities in that field. She was reputed to be the real author of the Act of 1889, restraining the control of vicious or idle parents over children that they had deserted. She worked for 12 years in connection with the central committees of the Poor Law Conference, and she was president of the National Union of Women Workers, 1903-1905. She made frequent public addresses and was an excellent speaker. She was a sister of the late Edward Clifford, author of *The Life of Father Damien*.

CLIMATE. See METEOROLOGY.

CLOVER, RICHARDSON. Rear-Admiral in the United States navy, died October 15, en route from California to his home in Washington, D. C. He was born at Hagerstown, Md., July 11, 1846, graduated at the U. S. Naval Academy in 1867, and by 1891 had become lieutenant-commander. He had 22 years of sea service. He had charge of the survey of southeastern Alaska, 1885-1886; was chief of the Naval Intelligence Office in 1817; commanded the *Bancroft* in the Spanish American War; was naval attaché in London, 1900-1903; commanded the United States warship *Wisconsin* at the Asiatic station, 1904-05; was president of the Board of Inspection and Survey, 1906-08, and retired from active duty on July 11, 1908.

COAL. The uncertain conditions following the resumption of business after the war found no more striking example than in the coal industry. Government control during the emergency had aimed at an unusually large production in order to keep the industries vital to our military and naval undertakings running. The signing of the armistice lifted the burden for a while, but the situation was soon complicated by increased demands from the railroads and from industry. Added to this was the disturbance due to the strike of the soft coal miners extending from November 1 to December 10.

Union leaders had threatened to call a strike in the industry beginning November 1st in October. The differences between the operators and the miners over wages and hours of labor began to assume an ominous aspect by October 23rd. Two days later President Wilson characterized the strike as wrong and illegal but, far from reaching a solution, the problem rapidly approached a crisis, and the union leaders ignored the President's letter of warning. As a result of this, the government laid plans for a possible return of the mines to government control and the guarding of them with troops. Oct 30 was crowded with events bearing on the situation. On that day the Senate pledged support to President Wilson, Acting President Lewis of the Mine Worker's Union despatched a telegram charging the President with usurpation of power, and Railroad Director General Hines ordered the seizure of coal in transit and the resumption of rationing.

In spite of strenuous efforts on the part of the administration, the threatened strike was called on the first of November. Soft coal miners throughout the country quit work with a unanimity that was attributed by some to the

organization built up among this class of laborers by the recognized use of collective bargaining in recent years. The next day the government ordered the coal miners to return to work but without success. On the fifth, President Wilson restored Coal Administrator Garfield's war power over land coal, calling him to Washington from Williams College, to the presidency of which he had returned. The day after this, the government called upon the courts to compel union leaders to call off the strike. From the beginning, the strike had been virtually without a head owing to the injunctions secured by the government. On November 11th, the strike leaders agreed to withdraw the strike order in the face of growing government opposition. There followed a considerable period of hickering, which was further intensified by Secretary McAdoo's sensational statement on the 24th of profits in the coal industry during the war.

On Nov. 26th the Cabinet reached an agreement over the wage controversy, but it was expected that the operators would not accept the proposal. Meanwhile the loss in production had forced the resumption of the war-time rules of coal-conservation early in December, followed by the cutting down of railroad schedules throughout the country. President Wilson's terms of strike-settlement were accepted by the miners on December 9th, the operators having agreed on the advance some days earlier. The strike was officially terminated December 10th. The soft coal miners resumed work but Coal Administrator Garfield resigned in protest to the terms of the settlement. The exact outcome of the settlement was a matter of speculation at the close of the year, but the restrictions due to the strike had been lifted and the mines were in operation again.

By Monday, December 15, bituminous production had approximated 70 per cent of normal. Conditions continued to improve throughout the week ended December 20th, the output for the week as a whole amounting to 86.4 per cent of normal. The trend of production during the period of the strike was as follows:

1st week (Nov 2-8)	29.6% of normal
2d " (Nov 9-15)	33.3% " "
3d " (Nov. 16-22)	44.3% " "
4th " (Nov 23-29)	47.4% " "
5th " (Nov 30-Dec 6)	43.5% " "
6th " (Dec 7-13)	48.0% " "
7th " (Dec 14-20)	86.4% " "

The total output (including lignite and coal coked) was estimated at 10,431,000 net tons. The average during the four weeks immediately preceding the strike, which may be regarded as normal, was 12,089,000 tons.

In a single week the bituminous industry climbed from the depression of the strike period to a level of production higher than that of any week from mid-January to mid-August preceding.

Some idea of the amount of coal mined in the United States in comparison with other countries may be gained from the following table which shows in thousands of tons the number of net tons mined in the principal producing countries in two years. The confusion resulting from the war makes these figures only approximate, as statistical reports have been greatly hampered thereby.

Country	Year	
	1917 1,000 tons	1918 1,000 tons
United States	651,402	678,212
Great Britain	278,319	255,040
Germany	c 281,429	c 273,930
France	a 81,847	a 30,864
Belgium	16,446	15,229
Japan	a 28,000	a 30,600
Canada	14,047	14,979
New South Wales	9,290	10,160
Union of South Africa	11,629	11,938
Approximate total for the world	1,473,000	1,468,000
Per cent of world total produced by United States	44.2%	46.2%
a Estimate, subject to revision c German lignite production estimated at 97,000,000 tons		

The following table shows the estimated production of beehive coke for January 1st to December 27th for 1919 and 1918 by districts:

ESTIMATED PRODUCTION OF BEEHIVE COKE (IN NET TONS) TO DEC 27

	1919	1918
Pennsylvania and Ohio	14,449,000	21,276,000
West Virginia	1,033,000	2,417,000
Alabama, Tennessee and Georgia	1,649,000	2,426,000
Virginia and Kentucky	1,172,000	1,573,000
Colorado, Oklahoma, and New Mexico	554,000	1,488,000
Washington and Utah	267,000	636,000
United States total	19,124,000	29,816,000
Daily average	63,000	99,000

The maintenance of the maximum prices on coke late in the year was said to have obviated the advisability of converting coal into coke at the mine which existed during the period from October 31st to December 8th, when the war-time prices had been restored for coal but not for coke. This, with the resumption of competition from by-product ovens as the latter received supplies of coal, was said to be partly responsible for the lower level of production.

Late in the year preliminary estimates of coal production for the year 1919 were made public by the Geological Survey. The report indicated a production of 86,200,000 tons of Pennsylvania anthracite and 458,063,000 tons of bituminous, a grand total of 544,263,000 tons. This was less than any year since 1915.

The record year, 1918, showed a production of 98,826,000 tons of anthracite and 578,386,000 tons of bituminous, a total of 678,212,000 tons. The greatest production of bituminous coal in any month of 1919 occurred in October, just prior to the coal strike, when every effort was being made to produce the largest possible quantity. The total in that month was 56,243,000, which was greater than the total of any month during the year 1918.

The coal deposits of Belgium, France and Germany were important elements in the strategy of the great war and the destruction of the mines and the readjustment of territory containing coal were serious matters for the Peace Conference. Aside from this the great question was the decline in production together with the demands for fuel in industry and domestic life. Everywhere there was a shortage varying in degree, it is true, but represented at least by high prices and at the worst by frightful social conditions. On December 1st a parliamentary paper was published by the British government

which contained the following significant table. Output of coal in United Kingdom, United States, France, Belgium, Netherlands and Germany.

Monthly average	Tons	Proportionate Figures
1913	87,270,000	100
1918	86,903,000	99.6
1919 (first half)	70,326,000	80.6
1919 (second quarter)	69,227,000	79.4

CONDITION OF FRENCH MINES. The coal mines of France were comparatively slow in returning to their normal condition, especially those where ruthless destruction had been wrought by German military engineers. This was particularly the case in the Lens region of France. In Lens at the end of the year 17 main shafts and 13 air shafts remained flooded and the dewatering of the mines was considered practically an impossible task until the German engineers who superintended the various demolitions and particularly the blowing of holes in the cement shaft linings could be brought back to give information as to the location of these holes. Even at best and under normal conditions the work of shaft sinking is extremely difficult as the ground is so moist that there is constant seepage, and when shafts were being sunk use was made of the freezing process until the cement lining is put in. Twenty-three companies controlling mines in Lens united during the year to organize a joint staff of engineers and experts to consider the rehabilitation process and also to collect their respective claims against the government. The importance of immediate action towards the resumption of mining was urged on the ground that France, a year after the armistice, was facing an annual shortage of 20,000,000 tons in coal production, which was almost one-half the normal French output. The mines in this region had been totally destroyed and French industry which in 1919 was ready to resume in many cases, was feeling such a shortage of fuel that they could count on little more than a day by day supply.

BRITISH COAL SITUATION. In the restoration of normal conditions of British commerce, the coal situation was receiving considerable attention. The pre-war production of Great Britain was 287,000,000 tons of coal, coke, and briquettes, of which 100,000,000 tons were exported as cargo on bunkers. In 1918 the output was 226,000,000 tons of which 35,000,000 tons were exported as cargo and 25,000,000 tons supplied as bunkers. This export and bunker business was with the Allies on a war rather than a profit basis, and as a result the British coal trade became thoroughly disorganized. Before the war coal represented 75 per cent by weight of all outward exports from the United Kingdom and formed as it always will the only bulk export. Naturally it was closely connected with the entire shipping as it provided a cargo to distance points where materials were available for shipment to Great Britain.

BELGIAN MINES. Unlike those of France, the coal mines of Belgium were not damaged by the Germans, and although they stood in need of new hoisting cables and other important repairs, by the middle of 1919 they were turning out 84 per cent of their pre-war deliveries. Belgium, during the last months of the year was export-

ing coal to France, Italy, Holland and Switzerland, a total of about 400,000 tons a month.

COAL STRIKE. See COAL and STRIKES AND LOCKOUTS.

COASTLAND. (German Küstenland.) A district of the former Kingdom of Austria, comprising the crownlands of Istria, Görz, Gradisca, and Trieste. Area 3078 square miles with a population in 1910 of 893,797, which was estimated in 1913 at 938,008. Trieste, the important seaport, is its largest city, with a population of 246,500 (including its territory) before the war. Pola, a former Austrian naval base, 59,300, and Görz (Goritz) 32,600.

COBALT. The use of cobalt contained in the silver-cobalt mines of Ontario in larger quantity than can be marketed as a material for coinage in the Dominion to replace the 5-cent silver piece has been suggested and advocated on the score that the 5-cent silver piece is very small and inconvenient to handle. A coin of pure cobalt intermediate in size between the 10-cent and 25-cent nickel pieces was recommended, as it would be readily distinguishable from all other coins, and would be both attractive in appearance and so hard as not to be counterfeited readily. The question of a cobalt coin for the British three-penny piece is also under consideration.

COBB, DARIUS. Artist, died at Newton, Mass., April 23. He was born at Malden, Mass., Aug. 6, 1834, and served with the Massachusetts Volunteers during the Civil War. He was a well-known painter of portraits and landscapes, including large exhibition paintings of scriptural and historical scenes. He was a lecturer and art critic and completed a head of Christ in 1814 which he exhibited in the chief cities of the country.

COCHIN-CHINA. The southernmost division of the French Colonial possession of Indo-China (q.v.). It has an area of 20,000 square miles, which is divided into 17 provinces. The total population in 1914 was placed at 3,050,783 of whom 11,251 were Europeans, excluding the military forces. Saigon is the capital and according to the French *General Year Book* for 1919, has a population of 64,496, of whom 4161 were Europeans, while Cholon had 190,085 inhabitants of whom 97,211 were Chinese. About one-fifth of the land is cultivated, the chief crop being rice. Rubber has been introduced, and its growing has greatly increased in the last few years. Other crops are bananas, oranges, maize, sweet potatoes, beans, betel-nuts, pepper, earth nuts, tobacco, coffee, and sugar cane. There is also extensive fishing and raising of live-stock. In 1916 721 steamers of 1,647,527 tons cleared the port of Saigon. Total exports in 1916 were 211,340,300 francs, and imports 155,748,700 francs. In 1918 the budget balanced at 8,582,900 piastres. The Colonial Council contains 18 members and the colony is represented in France by one deputy. It is a direct French colony and is governed by a resident governor.

COCHRANE, FRANCIS C. Canadian public official, died at Ottawa, Canada, September 22. He was born at Clarenceville, Quebec, Nov. 18, 1852. He was minister of Lands and Mines in 1905, member of Parliament in 1908, and Minister of Railways and Canals at the time of his death.

COINS, VALUES OF FOREIGN. The following estimates of the values of foreign coins for the beginning of 1920 were issued by the United States Director of the Mint:

COKE. See **COAL.**

COLCHESTER, REGINALD CHARLES EDWARD ABBOT, Third Baron. British peer, died at Brighton, England, March 2. He was born in

Country	Legal standard	Monetary unit	Value in terms of U. S. money	Remarks 1
Argentine Republic.	Gold	Peso	\$0 9648	Currency: Depreciated paper, convertible at 44 per cent of face value, exchange rate about \$0.4325.

Uruguay	Gold	Peso	1.0342	Exchange rate \$1.0504.
Venezuela	Gold	Bolivar1930	Exchange rate about \$0.1932.

London, Feb. 13, 1842, educated at Eton and Oxford where he was subsequently a Fellow of All Souls, and an examiner in law and history. In politics he was a Conservative, and he served as Charity Commissioner 1880-83 and on the London School Board 1891-94. He edited papers relating to Lord Ellenborough.

COLGATE UNIVERSITY. A non-sectarian institution of learning, located at Hamilton, N. Y. The enrollment for the fall of 1919 was as follows: College, 543; Theological Seminary, 56; total, 599. There were 44 members in the faculty. The income for the year was \$193,353. By the will of Richard M. Colgate the university received \$100,000 to be used for a new dormitory. The library contained more than 85,000 volumes. Colgate was founded in 1819. President, Elmer Burritt Bryan, LL.D., L.H.D.

COLLECTIVE BARGAINING. See LABOR LEGISLATION.

COLLEGES. See UNIVERSITIES AND COLLEGES.

COLLEGES, AGRICULTURAL. See AGRICULTURAL EDUCATION.

COLOMBIA. A republic in the northwestern part of South America. Capital, Bogotá.

AREA AND POPULATION. Boundary disputes with Peru and Venezuela make the estimates on area variant. A boundary agreement was signed with Ecuador in 1917. A provisional estimate gives the area as 435,000 square miles. Another estimate gives 440,846 square miles, the latter being the latest estimate (1919). The coast line is about 3100 miles with about half of it on the Pacific and half on the Caribbean. According to the census of 1912 the population of the 14 departments, 4,832,735; the 2 intendencies, and 7 commissaries, was 231,513, which with a prison population of 6793, makes a grand total of 5,071,101, with an average density per square mile of 11.5. This includes about 30,000 uncivilized Indians. The capital, Bogotá, had a population (1912) of 139,277; the chief commercial towns are Baranquilla, population 48,907; Manizales, 34,720; Cartagena, 36,632; Medellín, a mining centre, 47,354; Cali, 27,747; Bucaramanga, 19,735; Cúcuta, 20,364; the last two named are coffee centres.

EDUCATION AND RELIGION. Though gratis, elementary education is not compulsory. In 1917-18 the state spent 1,163,436 pesos on education. There were 5487 primary schools with 365,494 pupils and 5733 teachers, at that time. In 1917 there were 384 secondary and professional schools, with 33,115 pupils and 98 art and trade schools with 7044 pupils. The university at Bogotá, which was founded in 1572, is the oldest of several universities. The school of mines at

Medellin is well known. Both these are state institutions, the rest being departmental. Cartagena, Pasto, and Popayan are the seats of these universities. In 1918 there were 29 normal schools with an attendance of 1325 students. The state religion is Roman Catholicism, but other forms are tolerated, as long as they are not opposed to the law or Christian morals.

COMMERCE. The principal articles of export in 1917 were, in gold pesos: Coffee, 12,751,569; hides, 4,542,107; bananas, 2,695,365; gold and silver, 4,891,363; platinum, 2,017,554. About 67 or 68 per cent of the coffee exported in 1918 went to the United States. The cotton goes to Liverpool or Havre. The chief imports are petroleum, cotton goods, flour, and lard, which come from the United States, while the majority of the cotton goods come from Great Britain. Platinum exports in 1918 had more than trebled the 1915 figure, being somewhat over \$2,000,000 worth. The export values for 1917 are as follows, the 1916 figures being given in parentheses: \$40,531,330 (\$40,000,800), while the imports ran, \$23,333,826 (\$28,922,529).

COMMUNICATIONS. There were 10 national and 5 British railways in operation in Colombia in 1918 with a length of 740 miles. Of this 466 miles have a three-foot gauge and the rest one meter. In 1917 the gross railway receipts were 5,131,845 gold pesos with a transportation of 955,934 freight tons, and 4,728,155 passengers. Much of the inland traffic is by river, and the Magdalena is being channeled and cleared and is now navigable for 900 miles, steamers going as far up as La Dorada from Baranquilla, a distance of 592 miles. Many of the roads are mule tracks, but these are being improved into automobile roads by the government. Internal postal relations are not quick or efficient, but from Baranquilla, external relations are very good. The number of internal offices in 1918 was about 850. There were 12,000 miles of government telegraph lines in 1915 and 625 offices. A northwestern highway connecting the department of Cundimarca with the public roads of the department of Boyaca was practically completed in 1919. This opens one of the richest sections. At Cartagena in 1917, 234 vessels of 413,174 tons, entered; of these 113 were American and 36 British. In 1916, 208 vessels of 385,055 tons entered. Certain proposals for railway improvement in Colombia were announced during the year. It was stated that \$100,000 was to be raised for the completion and extension of the railway from Tolima to Ibagne. A trial trip had been made over the Gualanday Divide. Plans were being prepared also for the construction of the Uraba Railway, and were to be sub-

mitted to the national Congress of the republic.

A further extension of the Sabana Railway was also to be carried out, to run from Facativa to Pacho.

FINANCE. Gold is the standard of value, and the dollar, valued at 97.33, cents, is the monetary unit. The government has undertaken the redemption of paper money and the substitution of metallic. According to law, after May 1, 1918, silver coins minted prior to 1911 ceased to be legal tender. Revenue for 1917-18 and 1918-19 is as follows: 14,885,000 and 17,650,000, respectively. The expenditures were, for the same periods, respectively, 16,369,965 and 17,106,061. The 1919 financial condition was good on the whole—external debts being met promptly (there was some delay in 1916). Trade journals reported that during 1919 there was not much money in circulation, though more than in 1918, and industries suffered accordingly. In 1919 the country made decided economic progress, and with the development of communications, this should increase materially. The 1919 budget is as follows; year ending February 28th:

Revenue	Gold pesos
Salt tax	1,300,000
Railways	39,000
Telegraphs	560,000
Customs	11,000,000
Consular dues	825,000
Stamps	1,000,000
Succession dues	160,000
Total (including all Revenues)...	17,811,000

Crop	Year	Acreage	Prod. Bu.	Value
Beans	1919	69,000	448,000	1,568,000
	1918	252,000	1,638,000	7,207,000
Potatoes	1919	92,000	11,040,000	18,768,000
	1918	99,000	15,840,000	15,682,000

a Tons.

MINERAL PRODUCTION. The mine output of gold, silver, copper, lead, and zinc in Colorado for 11 months of 1919 and the estimated output for December, according to data compiled by Charles W. Henderson, of the United States Geological Survey, Department of the Interior, amounted to \$9,892,000 in gold, 5,630,000 ounces of silver, 35,650,000 pounds of lead, 3,400,000 pounds of copper, and 52,300,000 pounds of zinc, having a total value of \$22,522,000 as compared with \$12,751,718 in gold, 7,063,554 ounces of silver, 65,960,760 pounds of lead, 6,277,332 pounds of copper, and 89,133,901 pounds of zinc, having a total value of \$34,160,172 in 1918. This estimate shows a decrease of \$2,860,000 in gold, 1,430,000 ounces of silver, 32,160,000 pounds of lead, 2,877,000 pounds of copper, and 36,834,-

Expenditure	Gold pesos
Ministry of Interior	6,305,049
Ministry of Foreign Affairs	356,850
Ministry of Finance	1,169,564
Ministry of War	2,313,800
Public Instruction	1,224,651
National Debt Service	3,896,463
Public Works	1,529,281
Agriculture and Commerce	310,403
Total (including all Expenditures)	19,089,574

GOVERNMENT. The legislative power is held by two houses, Senate and Congress. The term of office in the Senate is four years, election by indirect vote; there are 35 members. The House of Representatives numbers 92 and the term is for two years. Sessions of Congress are held at Bogotá July 20th of each year. Executive power is administered by a President elected for a four year term, election by direct vote, and he is assisted by a cabinet of eight members—the ministers of the interior, foreign affairs, treasury, war, public instruction, commerce, agriculture, and public works. President for term ending Aug. 7, 1918, was Don José Vicente Concha. He was succeeded by Señor Marco Fidel Suarez, whose cabinet is as follows: Interior, Dr. Pedro Molina; Foreign Relations, Gen. Jorge Holguin; Finance, Dr. Marcelino Arango; War, Dr. Jorge Roa; Public Instruction, Dr. Emilio Ferrero; Agriculture and Commerce, Dr. Simon Araujo; Public Works, Señor Rafael Del Corral; Treasury, Señor Pedro A. Lapez.

COLLISIONS. See RAILWAY ACCIDENTS.

COLORADO. POPULATION. The population of the State in 1910 was 799,024 and on July 1, 1919 it was estimated to be 1,040,842, a gain of 26,000 during the year.

AGRICULTURE. The following table is compiled from a report of the Federal Department of Agriculture.

Crop	Year	Acreage	Prod. Bu.	Value
Corn	1919	671,000	11,206,000	\$15,913,000
	1918	610,000	10,675,000	14,411,000
Oats	1919	249,000	6,524,000	5,872,000
	1918	251,000	7,530,000	6,024,000
Wheat	1919	1,459,000	17,645,000	35,643,000
	1918	1,250,000	15,400,000	30,030,000
Hay	1919	1,065,000	2,396,000	44,326,000
	1918	1,030,000	2,287,000	35,448,000

000 pounds of zinc. Even at the increased value for silver of \$1.11 (average) as compared with \$1.00 in 1918, the value of the silver produced in 1919 was \$6,249,000 as compared with \$7,063,554 in 1918, and with the lower average prices for lead, copper, and zinc, there were respectively decreases of \$2,651,000, \$915,000, and \$4,398,000.

TRANSPORTATION. The total railway mileage of the State is 5542. The only State agency having authority over the common carriers is the Public Utility Commission which exercises functions of a regulatory nature. The road with the longest mileage is the Denver & Colorado, with approximately 1600 miles of track.

OFFICERS. Governor, Oliver H. Shoup, R.; Lieutenant-Governor, George Stephan, R.; Secretary of State, James R. Noland, D.; Auditor, Arthur M. Strong, R.; Treasurer, Harry E. Munnix, R.; Attorney-General, Victor E. Keyes, R.; Superintendent of Public Instruction, Mary C. Bradford, D.

JUDICIARY. James C. Garrigues, Tully Scott, James H. Teller, Morton S. Bailey, George W. Allen, H. P. Burke, John H. Denison.

COLORADO, UNIVERSITY OF. A co-educational State institution at Boulder, Col. The enrollment for the summer session of 1919 was 1346, and in the fall it was 1868. The faculty contains 200 members. There are 118,500 volumes in the library. The income for the year was \$600,000. New buildings erected during the year include an engineering laboratory, a greenhouse, a tunnel to carry heat lines, etc. The alumni are raising money for a soldiers' memorial building. The university was founded in 1876. President, George Norlin, Ph.D.

COLORED METHODISTS. See METHODISTS, COLORED.

COLUMBIA UNIVERSITY. A non-sectar-

ian institution of learning whose principal buildings are located at Morningside Heights in New York City. Allied corporations on this site are Barnard and Teachers' College. The medical school (College of Physicians and Surgeons) is located on West Fifty-ninth Street, and the College of Pharmacy on West Sixty-eighth Street. The University conducts a summer camp at Morris, Conn., the site of which comprises 585 acres. In the fall of 1919 there were registered in all courses 16,664 students, as follows:—Columbia College (academic department for men), 1709; Barnard College (academic department for women), 711; Schools of Mines, Engineering, and Chemistry, 159; Law School, 481; medical School, 404; School of Architecture, 57; School of Journalism, 116; School of Business, 238; School of Pharmacy, 461; Graduate faculties, 1090; School of Education, 1467; School of Practical Arts, 1191; School of Dentistry, 4; unclassified, 116. There were also 8460 students enrolled in the extension teaching department. The 1919 summer session enrolled 9539. The faculty, not counting 27 not in active service, numbered 1097. During 1919 the institution lost by death Calvin Thomas, Professor of Germanic Languages and Literature; James MacLay, Professor of Mathematics; Frank W. Jackson, M.D., Professor of Clinical Medicine; Samuel T. Dutton, Emeritus Professor of School Administration; Abraham Jacobi, Emeritus Professor of Diseases of Children. Rt. Rev. David H. Greer, D.D., Bishop of New York, Trustee; Charles Frederick Hoffman, Trustee. Gifts and bequests received during the year amounted to \$2,381,356 and include \$800,000 for general endowment from the estate of the late Horace W. Carpentier, a former Trustee, \$566,000 to establish a scholarship fund in memory of Perry McDonough Collins, from the executors of the estate of Kate Collins Brown, \$380,000 for the Endowment Fund of the School of Business, from an anonymous donor, \$210,000 from the estate of Robert Van Cortlandt for general endowment; \$100,000 to be added to the fund for the building for the School of Business; and more than \$200,000 from the alumni to be applied toward the deficit in the cost of maintaining the work of the university during the war. Among the important innovations introduced during 1919 were psychological tests for admission to Columbia College which may be substituted for the regular entrance examinations, a course in Contemporary Civilization for Freshmen in the College, which takes the place of instruction formerly given in History, Economics, and Philosophy; and Home Study courses under the department of Extension teaching. The library contained 737,000 volumes. Columbia University was founded as Kings College in 1754. President Nicholas Murray Butler. Ph.D., Jur.D., LL.D., Litt.D.

COMMUNITY SERVICE. This organization was established in 1919 as an outgrowth of War Camp Community Service to conserve the value of the war work and to make possible a broader and richer social and recreational life for the individual and the community in which he lives, through the development of a community-wide programme of leisure time activities. Organizers are being sent into communities inviting their services, where community committees representative of all the interests of the communities are organized, and programmes of activities including community singing, citizenship activities, the development of programmes and evening recreation centres, and similar events are in operation in a number of communities. National headquarters are maintained at 1 Madison Ave., New York. See WAR CAMP COMMUNITY SERVICE. See CHARITIES.

COCINERITE. See MINERALOGY.

CONCILIATION, INDUSTRIAL. See ARBITRATION AND CONCILIATION.

CONCRETE. FIRE-RESISTIVE CONCRETE. The Committee on Fireproofing of the American Concrete Institute, of which Walter A. Hull was chairman, reported at a convention of the Institute that gravel, particularly highly siliceous gravel, had been proving to be a poor sort of aggregate for concrete which was subject to fire. This was found in tests made by the Bureau of Standards and also in various fires where this material figured. The National Board of Fire Underwriters and the British Fire Preventions Committee, through their respective engineers, had looked into this matter, and they had found that great importance must be attached to the nature of the aggregate used in the concrete. The report discusses the matter in its many bearings and presents the following recommendations pending further developments along this line:

1. That for fire-resistive construction, limestone, trap rock, blast furnace slag and burned clay, be given a preference over highly siliceous gravels.

2. That in cases where gravel aggregate is to be used, with no additional protective material over the concrete, round columns be given a preference over rectangular ones.

3. That where gravel aggregate is used, all columns, but especially rectangular columns and round columns with spiral reinforcement, be given the additional protection of approximately 1 in. of Portland-cement plaster either on metal lath or reinforced by light expanded metal.

CONDENSED MILK. See DAIRYING.

CONFERENCES, INDUSTRIAL. See ARBITRATION AND CONCILIATION.

CONGO, BELGIAN. A Belgian colony of central Africa, formerly the Congo Free State, founded in 1885, by Leopold II, King of the Belgians, but annexed to Belgium in 1908.

AREA AND POPULATION. The estimates of area differ, one being 909,654 square miles, the other being 913,127 square miles. Important towns are Boma, the capital, Matadi, Banana, Leopoldville, Stanleyville, Kambove, Niangara, Bandundu, and Elizabethville. The population

of Bantu origin officially estimated at 7,000,000. The European population numbered in 1916, 5364. Of these 3004 were Belgians. The language is a composite of many dialects.

PRODUCTION. The five chief products in the order of their importance are: rubber, palm-nuts, palm-oil, white copal, and cocoa. Ivory is plentiful, and coffee is grown successfully. Cattle raising flourishes where there is no tsetse fly, and mining operations are carried on for gold and silver. Coal, iron, tin, and manganese are also known to exist.

COMMERCE. Total of imports in general trade in 1916 was £2,756,484; in special trades, £2,289,743. According to the Board of Trade returns the imports into Great Britain from Belgian Congo in 1918 amounted in value to £1,563,272. Of the special imports 1,303,979 francs was the value from the United States. At the port of Boma in 1916, 57 merchant vessels of 215,633 tons, entered. The administration possesses 17 steamers on the Lower Congo, and 44 on Upper Congo; there are also about 51 private steamers on Upper Congo.

COMMUNICATIONS. The Congo is navigable for about 100 miles above its mouth to Matadi. From there to Stanley Pool, 200 miles the river is unnavigable, but above this point it is navigable for a distance of 1600 miles. There were 51 postoffices in 1915 and 26 telegraph and telephone offices. There were 1081 miles of railroad on Jan. 1, 1918, and about 5609 miles of road partly suited for automobiles. An important railway development under consideration in the Belgian Congo, was the extension of the Katanga Railway, which ended at Bukama, to a new terminus at a place called Kibouerno, on the upper waters of the Congo. This would overcome the difficulties of navigation on the upper channels between Kabalo and Bukama, which often necessitates early discharge of cargo owing to the lowness of water and would provide more regular and quicker transit.

A further line was proposed from Kongolo southward to Kabalo, which would effect a junction with the existing lines from the Upper Congo at the latter place eastward to Lake Tanganyika.

FINANCE AND GOVERNMENT. The estimates for the 1919 budget are as follows: Revenues, £2,781,296 (2,317,494); expenditures, £2,768,742 (2,599,532), the figures in the parentheses being the 1918 estimates. The largest item of receipts was (1917) 12,370,000 francs for direct taxes, the rest following in amount in order named: Mines, 10,500,000; customs, 6,025,000; transports, casual receipts, various agricultural receipts, taxes on ivory, posts and telegraphs. The expenditures have as their largest single item 29,468,204 francs; the rest follow in amount in order named: Public debt and savings bank, river navy, various, mines, religion and education, posts and telegraphs, and coinage. There is a native force for defense of 12,000 men, and about 6000 territorial police. The king appoints a minister for administration of the colonies. There is a council of 14 members of which he is president. The local representative of the king in the colony is the governor general. M. Henry was appointed governor general in 1916 and held that post at the beginning of 1918.

CONGO, FRENCH. See FRENCH EQUATORIAL AFRICA.

CONGO FREE STATE. See CONGO, BELGIAN.

CONGREGATIONALISM. This denomination in the United States had, in 1919, 6019 churches, 5722 ministers of whom 3449 were pastors and 2273 without charges, 808,122 church members, and 709,859 Sunday school pupils. There were 2631 young people's societies, with 101,888 members and 1366 men's and boys' organizations, with 76,707 members. The home expenses of the churches of the denomination were \$10,251,586. The amount of salaries paid was \$5,358,871, an average of \$1440 for each pastor. The value of church property was \$96,355,821; invested funds amounted to \$12,460,152; debts, \$3,991,881. Among the Congregational national missionary societies are the following: the American Board of Commissioners for Foreign Missions, the Congregational Home Missionary Society, the American Missionary Association, the Congregational Education Society, the Congregational Church Building Society, the Congregational Sunday School Extension Society, and the Congregational Board of Ministerial Relief.

The Woman's Home Missionary Federation and the three (regional) woman's boards of missions, as representing the foreign activities are the work of the women of the denomination. The report of the board of commissioners for foreign missions showed that for the year ending Aug. 31, 1918, the receipts were \$1,309,006.

The 20 missions of the American Board are distributed in 16 lands. In the Near East: 1 in the Balkans; 3 in Turkey; in the Far East: 1 in Japan; 4 in China; 3 in India; in Africa 3; in the Latin world: 1 in Austria; 1 in Spain; 1 in Mexico; among the islands: 1 in Micronesia, 1 in the Philippines. The Japanese native work is self-supporting and carries on its own Mission in Korea where some 30 churches have been organized. A million and a quarter of dollars has been expended in this varied ministry, covering educational, evangelistic, medical, literary, agricultural, industrial, sanitary, reformatory, and relief work of large dimensions. The Red Cross work for Armenia is functioned almost entirely through the American Board. Five of the Board's Missions were in the war lands and have been seriously affected while rendering service to the natives. The American Missionary Association carries on a similar work among the Negroes, Hawaiians, Indians, Porto Ricans, and Asiatics in America. The Home Missionary Society carried on work during the year in 47 States and Territories. The number of missionaries was 1502, while the receipts for the year were \$695,365.

A Five Year Tercentenary Campaign which culminates in 1920, in celebration of the 300th anniversary of the landing of the Pilgrim Fathers at Plymouth, Mass., nears completion. The two financial goals of this movement, viz.: a steady yearly income from the churches of two million dollars for the Mission Boards, and a Five Million Memorial Fund for Ministerial Pensions, are now assured. Programmes of Evangelism, Recruiting and of the study of Pilgrim Principles have also been pursued. This Tercentenary Campaign is now enlarged in a further movement to raise in five years, 50 millions of dollars for missionary and education purposes in connection with the attainment of certain large spiritual objectives. The general ad-

ministration of the church is under the control of the national council. The officers of this council for 1919-1921 are: Moderator, Rev. Henry Churchill King; assistant moderators, Rev. Robert A. Hume and Rev. W. N. de Berry; secretary, Rev. Hubert C. Herring; treasurer, Rev. Frank F. Moore.

In foreign countries reports for 1919 show the following figures: The number of Congregational churches, chapels, and stations was 8716 with a membership of 680,482 and Sunday school membership of 822,036. Of this total England, Wales and Scotland had a total of 4922 churches, chapels and stations, 487,483 members, and 629,443 Sunday school members. Canada had 146 churches, chapels and stations, 13,721 church members, and 10,140 Sunday school members. Australasia had 489 churches, chapels and stations, 21,970 church members, and 35,160 Sunday school members. South Africa had 290 churches, chapels and stations, 20,920 church members, and 8821 Sunday school members.

CONGREGATIONAL METHODISTS

Founded in 1852 in Georgia, by a group of ministers of the Methodist Episcopal Church, South, who had an objection to certain features of the episcopacy and itineracy of that church. They organized what they considered a more democratic form of church government. The first conference adhered strictly to the doctrine of Methodism, but adopted the congregational form of government, although modified by a certain degree of connectionalism. In a few years the movement extended into the neighboring states of Alabama, Florida, and Mississippi, and at present churches are to be found in most of the Southern and some of the Northern States. The denomination suffered a considerable loss in 1887 when nearly one-third of its churches joined the Congregationalists, and within the past decade has suffered heavy losses, apparently through general disorganization. The missionary work has confined its activities to India, although churches in this country have been aided financially. Statistics for the beginning of 1919 show 196 churches, with 220 ministers, and 10,969 church members and probationers. There were 182 Sunday schools with 1146 officers and teachers, and 8785 pupils. Since 1906 the denomination has lost about 25 per cent of its members. The only periodical is the *Messenger* published semi-monthly at Ellisville, Miss.

CONGRESS. See UNITED STATES: also LABOR LEGISLATION.

CONNECTICUT. POPULATION. The population of the State in 1910 was 1,114,756, and on July 1, 1919, it was estimated to be 1,307,163, a gain of 20,000 during the year.

AGRICULTURE. The following table is compiled from a report of the Federal Department of Agriculture.

Crop	Year	Acres	Prod Bu	Value
Corn	1919	55,000	3,300,000	\$5,940,000
	1918	56,000	2,800,000	4,788,000
Hay	1919	340,000	a 514,000	16,429,000
	1918	350,000	a 455,000	10,920,000
Tobacco	1919	25,000	b 39,000	18,057,000
	1918	25,000	b 37,500	16,500,000
Potatoes	1919	24,000	1,680,000	3,276,000
	1918	25,000	2,375,000	3,919,000

a Tons. b Pounds.

FINANCE. The receipts of the State Treasury for the fiscal year ending 1918 were \$15,189,326,

while the expenditures for the same period were \$13,076,034. The funded debt of the State is \$12,062,100. The State ended this year with a net surplus of \$642,572.

OFFICERS. Governor, Marcus H. Holcomb; Secretary of State, Frederick L. Perry; Treasurer, G. Harold Gilpatrick; Adjutant-General, George M. Cole; Comptroller, Morris C. Webster; Attorney-General, Frank E. Healy; Insurance Commissioner, Burton Mansfield; Bank Commissioner, E. J. Sturges; Secretary, State Board of Education, Charles D. Hine; Secretary, State Board of Charities, Charles P. Kellogg.

JUDICIARY. Supreme Court of Errors: Chief Justice, Samuel O. Prentice; Associate Judges, Alberto T. Roaback, George W. Wheeler, John K. Beach, Edwin B. Gager, William S. Case; Reporter, James P. Andrews. See CHILD LABOR; OLD AGE PENSIONS.

CONSTANTINO, FLORENCIO Distinguished Spanish operatic tenor, died in Mexico City, November 19. He was born at Bilbao, Spain, in 1869. Having won fame in the principal opera houses of Europe and South America, he was brought to the United States in 1907, by Hammerstein (Manhattan Opera House), with whom he remained till 1910. Then he sang with the Boston and Chicago companies until compelled by ill health to leave the stage in 1914. His last months were spent in an insane asylum.

CONSUMPTION. See TUBERCULOSIS.

CONVICT LABOR. See PENITENTIARY.

COOK, SIR JOSEPH. Australian representative at the Paris Peace Conference. He held at that time the office of Minister for the Navy of the Australian Commonwealth. He was born in England and was a member of the Australian House of Representatives after 1901, rising to the place of Prime Minister in 1913. He was an enthusiastic supporter of the Dominion's thoroughgoing participation in the war, and he placed the Australian squadron under the orders of the British navy. The Liberal party defeated him at the general election of September, 1914, but he joined forces with the Hughes group and became a member of the coalition ministry.

COOK, SIR EDWARD TYAS. Prominent English journalist, died in London, October 1. He was born in Brighton, England, May 12, 1857, and educated at Winchester and at New College, Oxford, where he was president of the Union and Palmerston clubs, and where he graduated, First Class in the classics, in 1880. From 1882 to 1885 he was secretary of the London society for the extension of university teaching. He was contributor to *Pall Mall Gazette* under Mr. Morley's editorship, and then became assistant editor to Mr. Stead on whose resignation in 1890 he became editor. After the sale of the paper to Mr. Astor in 1892, he resigned and was successively editor of the *Westminster Gazette*, 1893-96 and the *Daily News* 1896-1901. He was knighted in 1912. Meanwhile he had served on the staff of the *Daily Chronicle* and given his time to the writing on a variety of subjects, including art, the Transvaal war, Greek and Roman antiquities in the British museum, and memoirs and lives of Edmund Garrett and Ruskin. He was the editor of the latter's works along with Alexander Wedderburn. In 1913 he wrote *The Homes and Haunts of Ruskin*, and a *Life of Florence Nightingale*, and in 1915 a biography of Delane of the *Times*.

COOPER, CHARLES LAWRENCE. American military officer, died in Worthington, Ohio, September 30. He was born in New York City, Mar. 6, 1845 and educated in the schools of New York. On May 27, 1862, he enlisted in the New York militia and served continuously with the exception of a short period after the Civil War. He took part in the Civil War, in Indian campaigns, and in the Porto Rico campaign during the war with Spain. He entered the regular army in 1866 and had risen to the rank of brigadier-general in the United States army on Aug. 16, 1903, when he retired. After June 30, 1904, he was on duty with the National Guard of Colorado. It was he who mustered the Rough Riders under Colonel Roosevelt into service during the Spanish-American War.

COÖPERATION. The coöperative movement appears to have thriven during the war, soaring prices united with a scarcity of the necessities of living to make it urgent that, wherever possible, competitive wastes be eliminated, and more than one government made use of coöperative organizations as distributing agencies. (See YEAR BOOK, 1918.) But while the movement grew within the national boundaries, the war effectually checked the tendency toward international consolidation which had been growing since the establishment of the International Coöperative Alliance in 1892. The action of the Alliance was suspended for the period of the war, since by the terms of its constitution, it could not function without representation of all of its members. During 1919 steps were taken to reestablish it upon a pre-war basis.

THE INTER-ALLIED COÖPERATIVE CONFERENCE. The Inter-Allied Coöperative Conference met in Paris from Feb. 7 to 10, 1919. Representatives were present from Belgium, Czecho-Slovakia, France, Greece, Italy, Lithuania, Russia (Archangel government), the United Kingdom, and the United States. It was decided that the importance of the Conference to the coöperative movement as a whole made it essential that the International Coöperative Alliance be represented, and deputies of that body were invited to attend in a consultative capacity. The United States was represented by Herbert Bruce Brougham, special agent on coöperation of the United States Bureau of Labor Statistics; delegates of the Coöperative League of America were detained in this country through passport difficulties. Charles Gide, the economist, dean of the Faculty of Law, University of Paris, was named President of the Conference. Three subjects were chosen for discussion: (1) The economic relations between the nations, and the attitude of the coöperative movement toward the Peace Congress. (2) The best means of unifying coöperative effort to assist in reestablishing coöperation in countries devastated by the war (France, Belgium, Serbia, and to some extent, Rumania, and Italy). (3) The international commercial relations to be established between the central coöperative organizations of the Alliance. A memorandum was drawn up and submitted to the Peace Conference in which it was urged that the functions of the Inter-Allied Committees of Food Control be maintained, and that such committees make use of coöperative organizations as distributing agents; specific measures were recommended for bringing about economic and commercial coöperation among nations. A further resolution was inter-

preted as a move toward the foundation of an International Wholesale Society: "The Inter-Allied Conference, confirming the resolution adopted in 1916, decided that an international bureau of statistics and commercial information will be constituted. The organization of this bureau, as well as the establishment of commercial relations between the different countries, are left to the Inter-Allied Coöperative Office for practical realization."

In accordance with instructions issued by the Conference, an International Committee on Relief of Devastated Areas was formed, and met in London, on Mar. 4, 1919. This committee directed that certain coöperative wholesale societies, notably those of Manchester, Antwerp, Paris, and Basel, be united under a common secretariat, in order to provide more efficiently for the supply of foodstuffs and financial aid to the devastated areas, working through, and rebuilding, the local coöperative societies in those regions.

THE INTER-ALLIED AND NEUTRAL COÖPERATIVE CONFERENCE. A second conference, in which neutral as well as Allied countries were invited to participate, was held in Paris from June 26 to June 28, 1919. Representatives were present from America, Armenia, Belgium, Bohemia, Finland, France, Georgian Republic, Great Britain, Greece, Holland, Lithuania, Rumania, Russia, Sweden, Switzerland, and Ukraina. Resolutions were adopted in favor of: (1) The building up of trade relations between the wholesale societies of different nations, and the establishment of an International Coöperative Trading Organization; (2) the formation of a committee to assist coöperation in the devastated areas, (3) requesting the International Coöperative Alliance to convene a meeting on Aug. 19, 1919, to determine the place, date, and agenda, for the next meeting of the central committee of the Alliance; (4) extending an invitation to the central organizations of unrepresented nations, asking them to join the International Coöperative Alliance.

THE SCANDINAVIAN ALLIANCE. Another important move toward centralization was effected in the early part of the year. The Coöperative wholesale societies of Denmark, Norway, Sweden, and Finland joined forces in the Nordisk Andelsforbund, and machinery was created whereby the supplies of all could be purchased through the central agency.

COÖPERATION IN THE UNITED STATES. In 1916 there were 800 coöperative organizations in the United States—each a comparatively small and separate unit—while at the present time there are some 3000, the majority of which are coordinated through the Coöperative League of America (see YEAR BOOK for 1918), according to figures given out by Mr. James P. Warbasse, the president of that organization. These associations fall into two classes—consumers' societies and agrarian societies; the latter are by far the more important in point of financial magnitude and membership rolls, but in operation, many of them fall short of orthodox coöperative principles. The past year has been noteworthy chiefly for general growth, but the tendency toward trade-union coöperation is also significant; the activity of the Seattle coöperatives is interesting in this connection. That organization is supported by federated trade unions, and operates a general store, a slaughter-

house and meat-packing establishment, a market with its own ice plant and cold storage facilities, a bank, a laundry, a printing plant, a restaurant, a milk condensary, several shingle mills, a fish cannery, a jewelry factory, and a number of recreation centres. During the general strike in Seattle (see STRIKES AND LOCKOUTS), these facilities were used for the maintenance of the striking workers.

Another movement of note is the activity of the Finnish Coöperatives, an organization which counts in its membership the great majority of the 200,000 Finns in this country. The movement has shown steady growth, and now includes over 150 societies, scattered for the most part, through the Northern States, from Wisconsin to the Atlantic Ocean. They operate a bank, printing plants, daily and weekly papers, and monthly magazines, as well as clubs, theatres, amusement parks, and other recreational centres.

COÖPERATION IN GREAT BRITAIN. Coöperative organizations have been particularly active in Great Britain during the past year. It is estimated that the business done by such organizations totals \$1,000,000,000 per year, with a saving of \$100,000,000, of which \$65,000,000 is annually returned to customers, in the form of cash dividends. Wholesale society sales for 1918 totaled \$317,139,877. The most significant development of the year is the affiliation of the coöperatives with the British Labor Party; no arbitrary consolidation has been effected, but the two organizations have agreed to nominate and vote for the same candidates in all elections. Another event of interest is of legalistic aspect:—The Treasury Department has annulled the clause limiting individual participation in coöperative organizations to \$1000, and as a result development bonds have been issued in all denominations, trade unions are being urged to bank their money in coöperative banks, and to invest their surplus capital in these development bonds.

COÖPERATION IN RUSSIA. The coöperative movement has continued to expand in Russia, despite unsettled conditions. Coöperative enterprise has entered into almost every field—production, distribution, credit, transportation, education, amusement—and it is estimated that two-thirds of the entire population belong to one form or another of coöperative organization. The latest available figures (given out by Mr. A. J. Zelenko, managing director of the American Commission of the Russian Coöperative Unions) are quoted: 'Consumers' Unions now have a membership of approximately 12,000,000, but since heads of families alone are permitted to be members, this probably represents close to 60,000,000 persons, credit societies, which bank individual savings and extend credit to consumers' societies, have a membership of 4,000,000, and the same number belong to producers' unions. In 1918 the various coöperative enterprises had a total turnover of 8,000,000,000 rubles (\$1,600,000,000) operated 500 industrial plants and gave employment to 50,000 persons.

COÖPERATION IN OTHER COUNTRIES. Figures published in *L'Economiste Français* (Paris, June 21, 1919) show that the membership of coöperative organizations in France totaled 1,500,000 in August, 1918, and that their yearly accounts amounted to \$115,800,000. Recent reports estimate the membership of German coöperative en-

terprises at 2,000,000, while 3,000,000 coöperators are attributed to Austria. In Denmark 40 per cent of the population are members of coöperative societies, in Switzerland and Holland more than 25 per cent, and the movement has obtained a firm foothold in Norway, Spain, Ireland, Finland, Canada, and in some of the South American Republics.

COÖPERATIVE FARMING. See AGRICULTURAL EXTENSION.

COPPER. The production of copper in 1918 was 1,908,533,595 pounds. This represents the smelter output in pounds fine, in comparison with 1,886,120,721 pounds in 1917, 1,927,850,548 pounds in 1916, and 1,388,009,527 in 1915. This was an increase of 1.17 per cent over the previous year. The total value of the output in 1918, as estimated by the Geological Survey at 24 7 cents a pound, was \$471,408,000 as against \$514,911,000 for 1917. The total production of new refined copper in 1918 was 2,432,000,000 pounds, representing an increase of 4,000,000 pounds over that of 1917. The following table shows the primary and secondary copper produced by regular refining plants and imported in 1917 and 1918, in pounds.

Primary Domestic—		1917	1918
Electrolytic	a	1,452,744,593	1,560,327,422
Lake		268,508,091	231,096,158
Casting		69,916,911	15,284,635
Pig and best select		82,376,576	76,165,976
	a	1,873,546,171	1,882,874,191
Foreign (electrolytic)	a b	555,000,000	492,181,364
Foreign casting and best select			57,329,735
		2,428,546,171	2,432,385,290
Secondary			
Electrolytic		66,337,771	34,674,062
Casting		12,779,125	9,018,049
		79,116,896	43,692,111
Total output		2,507,663,067	2,476,077,401

a The separation of refined copper into metal of domestic and foreign origin is only approximate, as an accurate separation at this stage of manufacture is not possible.

b Includes refined copper imported.

In addition to their output of metallic copper regular refining companies in 1918 produced bluestone having a copper content of 7,917,696 pounds.

According to returns from all producing companies, the stocks of electrolytic, Lake, casting, and pig copper on hand on Jan. 1, 1919 were 180,000,000 pounds, as against 114,000,000 pounds on Jan. 1, 1918, an increase during 1918 of 66,000,000 pounds.

Besides stocks of refined copper on hand Jan. 1, 1919, 562,600,000 pounds of blister copper and material in process of refining were reported as at smelters in the United States, in transit from smelters to refiners, and at refineries, compared with 411,000,000 pounds on Jan. 1, 1918. This does not include copper in stock at foreign smelters or in transit from foreign smelters to refineries in the United States.

The apparent consumption of refined new copper in the United States in 1918 was 1,662,000,000 pounds. In 1917 it was 1,316,000,000 pounds.

The apparent consumption is estimated by the Geological Survey by making certain deductions for exports, stocks held over, etc., from the total available yearly supply of new copper.

In the table below are given imports of copper ore and unrefined copper into the United States by countries for 1917 and 1918.

COPPER IMPORTED INTO THE UNITED STATES IN 1917 AND 1918, IN POUNDS

Country	1917		1918	
	Ore (copper content)	Unrefined black cop- per and copper in bars, pigs, or other forms	Ore (copper content)	Unrefined black cop- per and copper in bars, pigs, or other forms
U. K.	75,591	.	39,220	112,738
Spain.	371,902	.	.	.
Canada	31,126,511	40,571,284	30,060,903	37,881,986
Mexico	4,929,250	40,213,831	3,373,084	83,568,187
Chile	28,447,728	162,227,104	14,707,473	156,285,580
Cuba .	40,100,956	.	23,861,119	.
Peru . .	4,644,455	100,302,275	1,200,879	81,492,209
Japan .	.	6,393,524	.	827,404
Other countr's	6,804,139	5,890,018	3,629,335	18,203,547
	116,500,532	355,598,036	76,872,013	378,371,651

Copper exports from the United States in 1918 totaled 747,689,580 pounds, compared with 1,132,832,663 pounds in 1917. The largest part of the quantity exported consisted of refined copper in ingots, bars, rods, etc., and amounted to 690,027,891 pounds. During the same year 37,648,420 pounds of brass, of a value of \$29,-805,398, were sent to foreign markets.

Late in October the Federal Trade Commission made public a special report to Congress on the cost of producing copper in 1918 in the United States and in Canada, Mexico, Cuba and South America. The report dealt with 85 companies, producing approximately 2,250,000,000 pounds of copper—about 95.5 of the total United States production. The data was gathered by the commission during its inquiries for the war period.

The average cost of producing copper for the 85 companies in 1918, the report indicated, was slightly more than 16 cents a pound, and more than 85 per cent of the production cost less than 20 cents a pound. Thus the profit realized for the year averaged 28 per cent on the total investment of more than \$672,000,000.

The Arizona and New Mexico group produced the greatest proportion; 30 companies there producing more than 38 per cent of the total reported to the commission. This group had the largest investment and the lowest cost of production but its profit average came fourth in the seven groups under consideration.

Porphyry companies showed the lowest average cost of production—less than 15 cents a pound. They produced more than 34 per cent of the total.

On the basis of the commission's cost inquiry, the President fixed the price of copper at 23½ cents per pound, effective Sept. 21, 1917, the report pointed out; the price prevailing until July 2, 1918, when it was raised to 26 cents. Those prices were lower than the market prices before government control, and production was kept at almost the same level as under the stimulus of the pre-war prices. For the most part profits of the copper companies, according to the report, were "very high" under the government schedule.

The commission during its cost investigation

of the copper industry, established a uniform standard for determination of costs, some companies keeping books inadequate for a scientific ascertainment of costs.

Production of copper in the United States in 1919 fell considerably below that of 1918, according to preliminary figures of the Geological Survey issued at the close of the year. Figuring on an average price of about 19 cents a pound, the output for 1919 had a value of \$243,000,000, as against \$471,-000,000 for 1918. The figures given for the smelter production from domestic ores represent the actual output for the first 11 months of the year and the estimated output for December. The production of blister and Lake copper from domestic ores was 1,278,000,000 pounds in 1919, compared with 1,908,000,000 pounds in 1918 and 1,224,000,000 pounds in 1913. The supply of refined copper (electrolytic, Lake, casting, and pig) from primary sources, domestic and foreign, for 1919 was estimated at 1,800,000,000 pounds, compared with 2,432,000,000 pounds for 1918 and 1,615,000,000 pounds for 1913.

The Bureau of Foreign and Domestic Commerce reported that imports of copper in all forms for the first 10 months of 1919 totaled to 346,855,000 pounds, as against 575,800,000 pounds for the 12 months of 1918. Exports of pigs, ingots, bars, plates, sheets, rods, wire, and like copper products for the first 11 months of 1919, amounted to 496,350,000 pounds; the exports for the 12 months of 1918 were 744,-429,000 pounds.

About 180,000,000 pounds of refined copper were in stock in the United States at the beginning of 1919. Adding this quantity to the refinery output for the year shows a total available supply of refined copper of about 1,-980,000,000 pounds. On subtracting from this total the exports for the first 11 months and the estimated exports for the last month, and assuming that there was no change in stocks, it appears that the supply available for domestic consumption in 1919 was considerably less than the 1,661,000,000 pounds available in 1918.

The year 1919 could hardly be called satisfactory for the copper producers of the country. Due to the cessation of the war and other causes, the producers entered upon the year with a tremendous accumulation of copper, which even the large business transacted during May, June and July could not dispose of entirely. The government succeeded in liquidating its accumulation by the end of July, gaining the advantage of a sharply rising market.

Although the domestic business of those months was large, it was in part accounted for by the fact that a good part of the copper marketed at that time eventually found its way abroad in the form of rods and wire, which for some reason are more readily disposed of in Europe than raw copper. Though an increased export trade in wire bars, ingot bars and cakes was expected in certain quarters it did not eventuate. Such foreign countries as were financially able to buy to any extent found themselves oversupplied and other countries could not secure the requisite credit. Great Britain and the United States in particular found that they had greatly overestimated their needs in their government purchases. The copper market reached its lowest point for the year in March when the market stood at 14½ cents for

a time. Near the end of July it touched 23 cents due to a considerable demand from Japan, but a decline set in during August until 17½ was reached early in December, but the closing figures for the year showed a rally at about 18½ cents. The end of 1919 found the copper industry still burdened with a large accumulation not yet out of the way.

After the vast demands for copper experienced in the World War, the transition to peace conditions required considerable readjustment, especially as the consumption of copper, both for American works and for foreign account was most disappointing. Inevitably the rate of production developed in 1918 was slowed down and strikes at various centres were not altogether unwelcome in view of the limited demands of industry. There were considerable stocks of copper on hand at the beginning of the year and a moderate output was maintained, but at the end of the production was thought to exceed consumption at the rate of from 35,000,000 to 40,000,000 a month. From January values gradually declined until early in March a low point of 14.50 cents at New York was reached for electrolytic and 15.25. From this prices went up until the latter part of July when electrolytic copper reached 23.50 cents and Lake copper 23.75 cents. From this there was a decline until in December a second low point of 18 cents was reached. Reasons for this were to be found in the steel and coal strikes and the conditions of foreign exchange which acted against foreign buying. A committee of the Copper Export Association returning from Europe late in March reported that while much copper was needed on the continent there was little prospect of extensive purchases. Japan, however, figured to an unusual extent as a buyer of American copper and there were heavy exports to that country, in fact amounting to 63,131,603 lbs. up to Nov. 1, 1919, or more than had been taken in ten years previous to 1919. The government stocks of copper estimated at over 140,000,000 pounds were sold by the producers under an arrangement which secure the liquidation of these holdings by July. The copper interests at the end of 1919 were rather more hopeful as when difficulties were removed it was realized that a large European demand must come.

COPYRIGHT. Registrations for the fiscal year 1918-19 according to the report of the Register of Copyrights were 113,003 as compared with 106,728 for the year before. Of these, 37,710 were for books of which all but 1095 were printed in the United States. The chief classes numerically of the remaining registrations were musical compositions, periodicals, prints and illustrations, dramatic or dramatic-musical compositions, photographs, works of art, models or designs, motion pictures, and maps. The renewals numbered 1906 as compared with 1875 the year before. The fees for these registrations amounted to \$110,281.50. During this fiscal year the number of books printed abroad in foreign language was 1855. The total number of registrations from 1897 to the close of the fiscal year 1919 was 4,212,942. New copyright legislation was proposed during the year to remedy certain defects arising from war conditions which involved the loss of copyright protection for foreign works published abroad during the war. The bill which came up for its

second hearing on June 18, 1919 proposed an amendment to section 8 of the copyright act of 1910 for the retroactive protection of books printed abroad since Aug. 1, 1914, subject to certain specified conditions and the amendment of section 21 to increase from 30 days to 60 days the time, after the first publication abroad of the book in the English language, within which deposit of the copy may be made for the registration of the ad interim copyright, which was to be extended from 30 days to four months. It passed the House on July 23 and was referred to the Senate Committee on Patents. This measure was framed to meet a British proposal to the effect that works first published and copyrighted in the United States which had failed to secure copyright protection in Great Britain should be protected on publication there, provided the United States government undertakes the corresponding protection of English books in the United States. The Register of Copyright in his report recurred in 1919 to his recommendations made in previous years as to adequate protection of authors in English-speaking countries. He sets forth the matter as follows: The loss of adequate international copyright protection has assumed a greatly increased importance by reason of the development of the motion-picture industry, leading to large payments to the authors of copyrighted works for the exclusive right to use such works as the basis for motion-picture photoplays, and correspondingly large losses where copyright has not been secured. Something should be done to eliminate or minimize such losses. What is required is assured protection for literary, dramatic, musical and artistic works in the United States, Great Britain, and the British Dominions—that is, in all the English-speaking countries—for all works first produced in any one of these countries from the date of such first production or publication. This protection should be absolute and should be independent of any technical or merely formal requirements.

In my report two years ago it was suggested that a remedy for this insufficient international protection might be found in a literary-property convention for the formation of a copyright union of all English-speaking countries with the express purpose of guaranteeing full protection in all of these countries for the works of authors, artists, and composers who are citizens or subjects of any one of them. The two years that have passed have accentuated the need of some practical action. The lack of protection in Canada for American plays is cause for much complaint, and the copyright relations between the United States and the other British self-governing dominions are equally unsatisfactory. The remedy proposed should therefore extend to include protection in all these countries. There is a community of interest between all the English speaking and reading nations which urges the establishment of assured protection for all intellectual works throughout all of them. The advantage of such an arrangement would have double weight for our citizens—it would secure to American authors protection for their works in all these countries, and it would protect the American publishers who reproduce in the United States works by authors of the other English-speaking countries.

CORN. Data regarding the world's corn pro-

duction in 1919 continued to be as fragmentary practically as the annual data during the period of the war. Provisional figures published by the International Institute of Agriculture, Rome, placed the total production of eight countries in the northern hemisphere at nearly 3,129,000,000 bushels which represented an increase of over 15 per cent as compared with 1918 for the six countries reporting in both years. A most marked recovery in corn production was recorded for Rumania where the increase over the preceding year was more than 400 per cent, due rather to a better yield than an increased acreage.

The estimates of production given for various countries were as follows: Rumania, 100,467,000 bushels; Italy, 78,800,000 bushels; Spain, 24,574,000 bushels; Canada, 11,234,000 bushels; Guatemala, 4,942,000 bushels; Switzerland, 286,800 bushels, and Algeria, 236,400 bushels. The United States, the greatest corn-producing country of the world, according to estimates by the Department of Agriculture, produced 2,917,415,000 bushels in 1919 as compared with 2,502,665,000 bushels the year before, or an increase of about 16.5 per cent. The year's yield was also approximately 6 per cent above the average production for the five years 1913 to 1917.

The area devoted to the crop, mainly owing to a large wheat acreage as a war measure, was only 102,075,000 as against 104,467,000 acres in 1918 and 107,496,000 acres the average for the five-year period mentioned. The average yield per acre 28.6 bushels, the highest since 1912, more than offset the reduced acreage. This was greater by 4.6 bushels than the average acre yield for 1918 and three bushels above the five-year average. The farm value per bushel on December 1st was 134.9 cents as compared with 136.5 cents on the corresponding date in 1918 and with 82.5 cents for the five-year period. The total value of the 1919 crop at 134.9 cents per bushel was \$3,934,234,000, the highest on record and greater by \$517,994,000 than the value of the 1918 crop and about 40 per cent above the five-year average.

Most corn importing countries continued the fixed maximum prices established by law and in force in 1918. Ocean freight rates under governmental control while still about four times as high as the ordinary merchant rates in 1913 were reduced to a marked degree during the year. From North Atlantic ports to Liverpool the rate on wheat and corn in October and November was \$9.50 on a gold basis per metric ton (2204 lbs.) or about 24 cents per bushel of corn as compared with rates of over \$50 per metric ton the year before. From Buenos Aires and La Plata to the United Kingdom the government rates for the period mentioned were nearly \$15 and the merchant rates approximately \$36 per metric ton, while the merchant rates from these points to the continent were about \$45.50 for the same quantity and during the same period. The merchant rates were governed only by the supply and demand of ocean tonnage.

The results of observations by the United States Department of Agriculture published during the year proved of value in connection with corn shipments overseas. Corn which was dry and in sound condition when shipped arrived in Europe in a like sound condition regardless of the position in which it was stowed, the time of year in which it was shipped, or the length

of the ocean voyage. The higher the percentage of moisture in the corn when shipped the greater was the danger of spoilage during the voyage. It was found that an estimate of the condition of corn on arrival in Europe could be based on the quality, condition and temperature of the corn at the time of shipment.

An insect pest menacing to the corn crop, known as the European corn borer, was first observed in the United States in 1917 near Boston, Mass., and early in 1919 it was reported from the vicinity of Schenectady, N. Y. The area infested at the beginning of the year was 300 to 400 square miles in each locality. Action was taken by Federal and State authorities to prevent the spread of the infestation. This insect is much more destructive than the larger and the lesser cornstalk borers which infest certain parts of the country.

A study of the cost of producing corn made by the Missouri Agricultural Experiment Station from 1910 to 1917, inclusive, showed that on the average for the period corn produced and put into the crib cost \$15.98 per acre or 57 cents per bushel and that the crop paid the farmer \$2.26 net for each 10 hours of labor spent on it. For the four years beginning with 1910 the farmer's labor income per 10 hours was only 87½ cents while in 1917 it reached \$9.53.

CORNELL UNIVERSITY. A non-sectarian institution for higher education, at Ithaca, N. Y. The enrollment for the summer session in 1919 was 2800 and in the fall it was 5432. The entire teaching staff numbers 650. Productive funds of the university amount to \$16,073,000 and the income for the year was \$3,526,439. The library contains 610,000 volumes. During the year there was received an anonymous gift of \$1,500,000 for a chemical laboratory. Late in the year a campaign was started to raise an additional endowment of \$10,000,000, at least half of which is to be used for increasing the salaries of teachers.

CORPORATIONS. See TAXATION and TRUSTS.

CORPUS CHRISTI DISASTER. See HURRICANES.

COSTA RICA. A republic of Central America, independent since 1821, lying between Nicaragua and Panama, and having the Caribbean Sea on the east and the Pacific Ocean on the west and south. Capital, San José.

AREA AND POPULATION. The area is estimated at various amounts. The nearest figure is apparently 18,691 square miles. The population, according to the estimate of Dec. 31, 1917, was 454,995, distributed among the various provinces as follows: San José, 136,936; Alajuela, 109,063; Heredia, 47,859; Cartago, 72,217; Guanacaste, 42,120; Punta Arenas, 22,884; Limón, 22,916. Estimated population of San José, 35,654. For the purposes of public health, the country has been divided into 26 districts superintended by medical men paid by the national treasury.

EDUCATION. Primary education is free and nominally compulsory. No later statistics are available than those given in the preceding YEAR BOOKS which are for 1915. At that time there were 419 elementary schools with 1489 teachers, and 34,703 pupils enrolled. There are colleges at several of the principal cities.

PRODUCTION. Agriculture is the chief occupation and coffee and bananas are the chief prod-

ucts. Great quantities of redwood, cedar, mahogany, and other cabinet woods are found in the forests. In 1917 and 1918 there was an increased trade in coffee and bananas with New Orleans, Mobile, New York, and Boston. In 1917 the shipment of coffee to the United States was 4,500,000 lbs. Rice is easily raised but was not produced in 1917 in sufficient quantities for home consumption, and it was necessary in 1917 to import 3,686,177 lbs. In 1919 the home production was greater. The production of sugar cane is universal, and almost every farm has its patch for use as fodder. The capacity of sugar refineries in 1919 was placed at over 7000 tons a year. Next to agriculture, the leading industry is gold and silver mining on the Pacific slope. Among the important mines are the Abangarez and those of Aguacate La Union and La Trinidad. Mining of manganese has recently been developed more widely, and the exports for 1919 show a decided increase. In 1918 it was reported that a large petroleum grant had been made by the government, covering about 11,500 square miles, and being virtually under British control. The lack of adequate transport has prevented the development of the coal resources, which are very rich.

COMMERCE. The value of imports into and exports from Costa Rica, including coin and bullion, in 1917 was 1,203,277 pounds sterling, and 2,447,777 respectively, and for 1916, imports, 1,420,199 pounds, and exports, 2,391,649 pounds. For 1917 the value of the chief imports was as follows, in pounds sterling: Cotton goods, 54,918; cattle, 25,292; coffee, 16,255; flour, 111,859; lard, 25,189; drugs, 29,473; rice, 30,981. The exports, bananas, 868,951; coffee, 812,848; gold, silver, and concentrates from mines, 214,245; hides and skins, 70,877; timber, 62,193.

COMMUNICATIONS. In 1917, there entered the ports of the Republic 577 vessels, of 794,893 tons. Limón is visited regularly by steamers of three steamship companies, one British, one American, and one Italian. The American line is owned by the United Fruit Company. Three lines visit the Pacific port of Punta Arenas. Since the beginning of war, there has been a reduction in the tonnage of ships, for while the same number of ships, or even a greater number had entered, they were smaller vessels, and the total tonnage was thus reduced. Length of railway in operation reported in 1916 was 431 miles, including branches and sidings. Limón and Panama are connected by wireless telegraph, also Bluefields in Nicaragua, and Colon in the Republic of Panama. On Jan. 1, 1919, there were 1514 telephones and 2291 miles of telephone wire in operation; and 122 telegraph offices listed.

FINANCE. Gold is the standard of value, and the unit of currency is the colon, with a par value of 46.536 cents. Revenue, 1917, £685,935, with an expenditure of £1,237,367, and in 1918 the revenue was estimated at £917,300 with an expenditure of £904,042. At the end of the year 1917 the total debt amounted to 50,299,732 colons, of which 30,776,784 was foreign debt, and the rest internal. The estimates for 1918 according to a British authority, were—Revenues, 917,300 pounds sterling, and the expenditures, 914,042. The same British authority indicated that the increase for 1919 would be in this same proportion. During 1916 the average rate of exchange on New York was 3.54 colons

per dollar, and in 1917, 4.77 colons. The chief sources of revenue are customs, liquors, railways, posts, and telegraphs, and the chief items of expenditure are finance, public instruction, and internal development.

GOVERNMENT. Under the new constitution, which was adopted on July 13, 1917, the president and vice-president are chosen for six-year terms by an electoral college comprising both houses of Congress, representatives of municipalities, ex-presidents of the republics, judges, and cabinet officers. The provisional President, Señor F. A. Barquero, assumed office Sept. 2, 1919, and on the following day organized his ministry as follows: Secretary of foreign relations, justice, culture, and beneficence, Señor Andres Venegas Garcia; secretary of government and police, Señor Carlos M. Jimenez Ortiz; secretary of public instruction, Señor Jose Joaquin Garcia Monge; and secretary of war and navy, Gen. Juan Bautista Quirós.

COST OF LIVING. See PRICES.

COTTON. The Crop Estimating Board of the United States Department of Agriculture, on Dec. 11, 1919, estimated the cotton crop of the United States for 1919 at 11,030,000 bales of 500 pounds each. An estimate of the International Institute of Agriculture at Rome, announced November 22, placed the crop at 10,203,925 bales. Each of these estimates indicates a small crop, probably the least since 1903, and the estimate of 11,030,000 bales represents a reduction of nearly 15 per cent from the five-year average of 1913-1917.

The area planted to cotton was 32,390,000 acres, a reduction of 2,940,000 acres below the average of 1910-1914. Throughout much of the cotton region the weather conditions early in the season were very unfavorable and a considerable area was abandoned by reason of boll weevil invasion. This was especially true of the Sea Island regions of Georgia and Florida.

The farm value of the crop and lint was estimated by the Secretary of Agriculture at \$2,332,913,000, based on the prices prevailing on Dec. 1, 1919. This indicates that the crop of 1919 was probably the most valuable cotton crop ever produced in the United States.

The Bureau of the Census reports that there had been ginned, prior to Jan. 1, 1920, 10,017,089 bales, exclusive of linters. In this report are included 110,373 round bales, each of which is counted as half a bale; 33,147 bales of American Egyptian cotton; and 6710 bales of Sea Island cotton. The American-Egyptian cotton was mostly grown in Arizona. The returns of Sea Island cotton were: Florida, 2886; Georgia, 650; and South Carolina, 3174 bales. In the Sea Island cotton production there was a reduction of 30,139 bales from the crop of 1918, due to a large degree to the abandonment of large areas on account of boll weevil infestation. Georgia, which produced 21,279 bales in 1918, had reported only 650 bales ginned at the end of 1919.

The Egyptian crop of 1919 was reported as about average in Lower Egypt, while the prospects for Upper Egypt and Fayoum were better than in 1918. The crop was estimated at about 1,188,000 bales of 500 pounds each. According to Consular Reports the crop of Brazil was estimated at 1,600,000; Mexico, 120,000; and Spain, 13,200 bales. No data are available regarding the present crop in India, but the area

planted was 17.7 per cent less than the average of the previous five-year period.

The cotton crop of the United States for 1918, the estimated crop for 1919, and the amount reported ginned to Jan. 1, 1920, exclusive of linters, by States were:

States	Crop, 1918 500 pound bales	Estimated crop, 1919 500 pound bales	Reported ginned, Jan. 1, 1920 Running bales
United States . . .	12,040,532	11,030,000	10,017,089
Alabama . . .	800,622	715,000	680,459
Arizona . . .	55,604	75,000	47,262
Arkansas . . .	987,340	830,000	715,663
California . . .	67,351	102,000	41,161
Florida . . .	29,415	17,000	17,515
Georgia . . .	2,122,405	1,730,000	1,637,738
Louisiana . . .	587,717	300,000	291,222
Mississippi . . .	1,226,051	946,000	823,082
Missouri . . .	62,162	60,000	48,286
North Carolina . . .	897,761	875,000	789,053
Oklahoma . . .	576,886	930,000	791,644
South Carolina . . .	1,569,918	1,475,000	1,403,592
Tennessee . . .	329,697	298,000	239,878
Texas . . .	2,696,561	2,700,000	2,465,377
Virginia . . .	21,885	22,000	21,150
All other States . . .	6,157	7,000	4,002

The final report of the Bureau of the Census showed the crop of the United States for 1918 was 12,040,532 bales, to which there should be added 929,516 bales of linters. The Sea Island cotton crop for 1918 was 52,208 running bales produced as follows: Florida, 20,571; Georgia, 21,279; and South Carolina, 10,358 bales. To June 30, 1919, there had been crushed by oil mills in this country 4,432,357 tons of cotton seed which yielded 1,308,421,423 pounds of crude oil, 2,152,187 tons of cotton seed cake and meal, 1,112,910 tons of hulls, and 127,286 bales of hull fibre. The exports of cotton for the year ending July 31, 1919, amounted to 5,663,290 bales, and the imports for the same period were 201,586 bales. The principal exports were: To the United Kingdom, 2,635,198; Japan, 784,522; France, 734,739; and Italy, 588,373 bales. The leading imports were: From Egypt, 100,006; Mexico, 54,436; Peru, 25,229, and China, 10,872 bales.

The world's production of cotton, exclusive of linters in 1918 was, according to the Bureau of the Census, 17,769,000 bales of 500 pounds net, and the consumption for the year ending July 31, 1919, was approximately 15,970,000 bales. The total number of active and idle spindles in the world is placed at 150,000,000. During the year ended July 31, 1919, cotton mills in the United States consumed 5,767,519 bales. Of these, mills in the cotton States took 3,201,186 bales and those in the other States, 2,566,333 bales. The active spindles in July, 1919, were: Cotton growing States, 14,583,427, and for the balance of the United States, 19,600,980.

Data regarding the cotton situation outside the United States are rather meagre. During the past year the results of a cotton survey of Egypt have been announced. It is claimed, with proper irrigation and drainage, there are sufficient areas for the production of 2,250,000 bales. It is reported that the wide adoption of early maturing varieties has proved a distinct advantage in combating the pink bollworm. The dominant varieties now grown are: Sakel-laridis in the Delta region and Ashmouni in Upper Egypt. The monopoly formerly exercised by the Egyptian government in the purchase

and sale of cotton was terminated Aug. 1, 1919. The British Cotton Growing Association continues to be interested in the production of the staple in British territory.

In South Africa about 12,000 acres and in Zululand 1000 acres were planted to cotton in 1918. In the latter country a staple $1\frac{1}{4}$ inches long, of good color and strength, was produced. In Nyassaland in 1916 there were produced 6925 bales of what is called Nyassaland upland cotton. There are estimated to be more than 1,300,000 acres suitable for cotton growing in the country. The British West Indies produced in 1918, 1,530,109 pounds of Sea Island; 279,809 of Marie Galante; and 2335 pounds of native cotton.

In India attention is being given to the improvement of cotton, and seed farms have been established for supplying seed of selected strains of cotton. In the Madras Presidency especial attention is being given to the improvement of Northern and Tinnevelles cottons. The acting entomologist has reported the presence of a small stem boring beetle that causes considerable loss in Madras. The Association Cotonniere Coloniale is making an effort to stimulate cotton growing in French colonies and while the production fell off during the war, it is estimated there were about 2,000,000 pounds produced in 1917.

The pink bollworm situation in Texas is considered satisfactory in the main. Late in 1918 the pink bollworm was discovered in the Great Bend of the Rio Grande and in the Pecos Valley of western Texas. Active clean up work was at once begun and no infestations were found in these regions in 1919. All cotton growing in the vicinity of the mills which received Mexican cotton seed in 1916 was thoroughly inspected, and no new infestations were found until in October when a few specimens were taken in an isolated region a few miles south of Beaumont. A thorough search of the region was made but no additional specimens were found. All cotton in the region was destroyed. The legislature of Texas on Mar. 10, 1919, enacted a new pink bollworm law which regulates the growing of cotton in the formerly quarantined areas of the eastern part of the State. During the year airplanes were successfully employed in scouting the non-cotton zones of the State. In addition to the work in Texas, surveys were made in North and South Carolina, where Mexican cotton was received prior to 1918, and in Arizona where there was thought to be possible infestation through the carrying in of infested seed by Mexican laborers, but no pink bollworms were found.

The boll weevil advance in 1919 was favored by the very mild winter of 1918-19, permitting many of the weevils to successfully hibernate. A wide infestation in 1919 was reported. The eastern spread of the boll weevil was stopped when it reached the Atlantic seaboard in 1917 and 1918, and during 1919 its advance was mainly in a northeastern direction. Practically all of Georgia and much of South Carolina were reported as infested in 1919 and late reports show that the boll weevil reached some of the counties in North Carolina in the vicinity of Wilmington. One of the important events of the year in boll weevil control was the demonstration of the efficiency of calcium arsenate applied as a dust to the plants. The dew takes up

some of the arsenic and the boll weevils sipping it are quickly destroyed. The calcium arsenate is applied as a fine dust with power blowers. The treatment is said to be economically satisfactory when applied to cotton grown on an intensive scale.

A World's Cotton Conference was held at New Orleans October 12th to 16th with a large attendance. Among the questions discussed were the desirability of uniform cotton bales, seed selection, better cotton farming, new sources of cotton, uniform classification, etc. A plan was proposed for bringing the cotton grower and spinner closer together. According to data submitted, there are more than 6,000,000 persons engaged in the cotton industry and \$20,000,000,000 is invested in the growing, sale, and manufacture of cotton.

COURLAND. Situated on the Baltic Sea and the Gulf of Riga, it is bounded on the south by Kovno. Area, 10,435 square miles; population, estimated Jan. 1, 1915, 812,300. Libau is the largest city with a population estimated before the war at 90,700. The capital is Mitau (Mitava) with a population of 46,800. It passed into the hands of Russia at the third partition of Poland in 1795, and up to the revolution, was one of the Baltic Provinces of Imperial Russia.

COWLES, EDWARD. Specialist in mental diseases, died at Plymouth, Mass., July 25. He was born at Ryegate, July 20, 1837; educated at Dartmouth and at the College of Physicians and Surgeons, New York City; was assistant physician at the Hartford Retreat in 1863; became a surgeon in the United States army during the war and in 1879 was appointed medical superintendent of the McLean Hospital, Somerville. He held this office until 1903. He was also professor of mental diseases at the Dartmouth Medical School from 1885 to 1914, and after that Professor Emeritus. He was a lecturer in the meanwhile at other universities.

COWLES, JULIA DABROW. Author, died at Toronto, Canada, September 6. She was born at Norwalk, Ohio, Jan. 6, 1862, and studied in the University of Minnesota. She was editor on the staff of *The Housekeeper*, 1903-06, and devoted herself especially to the writing of stories for children. A list of her writings includes the following: *Jim Crow's Language Lessons* (1903); *Stories to Tell* (1906); *Robinson Crusoe Reader* (1906); *Our Little Athenian Cousin of Long Ago* (1913); *Our Little Roman Cousin of Long Ago* (1913); *Our Little Spartan Cousin of Long Ago* (1914); *The Art of Story Telling* (1914); *Our Little Macedonian Cousin of Long Ago* (1915); *Favorite Folk Tales Retold* (1916); *Going to School in Animal Land* (1917); *The Queer Little Tailor* (1917); *Indian Nature Myths* (1918); *Plays and Poems* (1917-18).

COWS. See DAIRYING.

COX, KENYON. American painter, died in New York City, March 17. He was one of the leading mural and figure painters of the time and was also well-known as a writer of art subjects. He was born at Warren, Ohio, Oct. 27, 1856, and after studying in this country passed

five years in Paris under Carolus Duran and Gérôme, chiefly the latter. In 1887 he received a medal at the Paris exposition. On returning to the United States he led the movement which resulted in the founding of the Society of American Artists and he was for many years a teacher in the Art Student's League. His paintings include a variety of figure subjects but his reputation mainly rests upon his mural works among which may be mentioned: Decorations in the Library of Congress; Bowdoin College; Minnesota State capitol; Citizen Building, Cleveland, Ohio. Iowa State capitol, Newark, N. J., Wilkes-Barre, Pa. In 1910 the medal of honor for mural painting was awarded to him by the Architectural League. He designed the mosaics in the dome and the paintings in the Senate Chamber of the Wisconsin State capitol. Among the best known of his pictures may be mentioned "Hope and Memory," "The Hunting Nymph," "Book of Pictures," "A Vision of Moon Rise," and "October Afternoons." The portrait of Saint-Gaudens and his painting of the Harp Player are in the Metropolitan Museum, New York. His writings on art subjects are regarded by art critics as sound and scholarly and among them may be mentioned the following: *Old Masters and New* (1905); *Painters and Sculptors* (1897); and *The Classic Point of View* (1911). He was also the writer of a humorous book entitled *Mixed Beasts* (1904).

CRANE. The development of naval and merchant ships during the war led to the construction of important machinery at the navy yards on a larger scale than ever previously attempted. At the Philadelphia Yard there was under construction in 1919 at the fitting-out slip a crane with a lifting power of 392 tons, capable of handling larger assemblies of battleship machinery than had previously been installed as units. This crane was of the revolving hammer-head type, standing 230 feet high, or the height of a modern 16-story office building. The bottom chord of the revolving truss clears the ground by 170 feet, and the operating house 200 feet in the air has a height equivalent to two stories, and is itself equipped with a 35-ton crane for handling the operating machinery. The contract was let on Dec. 27, 1917.

A somewhat smaller floating revolving crane of large capacity was put into service at the Mare Island Navy Yard during 1919, to be used for shipbuilding, repair and fitting out purposes. This machine was furnished at a contract cost of \$480,000, and the pontoon on which it was mounted was manufactured and the machinery installed at the yard. It is a counterpart of the one at the Norfolk yard, and is capable of handling a 150-ton load at an overhang of 62½ feet from the side of the pontoon. The elevation from the hook under such conditions is nearly 100 feet, so that the crane could be used for extremely heavy loads, revolving them to position and stowing them aboard ships of the highest freeboard. The maximum upward reach of the jib was approximately 200 feet.

CRAWFORD, SIR RICHARD. Commercial commissioner at the British embassy in the United States during the war, died at Bournemouth, England, August 27. He was born in 1862. He had been engaged in the difficult task of preventing friction between England and the United States before the United States entered the war, and during the period when the applica-

tion of the British blockade naturally tended to cause irritation in certain quarters. His tact and courtesy and his perfect fairness did much to maintain good feeling between the two countries, and caused him to be honored and esteemed by Americans. The war work told heavily on him, and although he accepted a post in Egypt in the hope of recuperation he did not recover.

CRETE. An island in the Mediterranean Sea, under the suzerainty of Turkey until May 31, 1913, when it was ceded to the Balkan powers, which by treaty of Aug. 10, 1913, the treaty of Bucharest, was formally recognized in its union with Greece. Area, 3327 square miles; population, 1911, 344,001; capital, Canea, with a population of 25,185. Language, Greek, and majority of people are Greek. The export trade is mainly wheat, fruit, olive oil, wool, soap, carobs, cheese, and valonia. See *ARCHAEOLOGY*.

CRICKET. The end of the war caused a big boom in cricket with the return from the battle front of the leading players. The New York Club for the second year in succession won the Halifax Cup series held under the auspices of the Associated Cricket Clubs of Philadelphia. The Germantown Cricket Club put up a valiant fight, only succumbing after a play-off. Bert Kortlang of the Manor Field Cricket Club was the leading batter in the series and A. B. Mann of the Germantown Club was first among the bowlers. In New York City the Manhattan Cricket Club of Brooklyn gained the title in the Metropolitan District League competition and the Manor Field Club of Staten Island carried off the laurels in the New Jersey Cricket Association series.

CROATIA AND SLAVONIA. Formerly, though not a part of Hungary proper, formed a part of the Hungarian Kingdom as a crownland; now a part of Jugo Slavonia or the Southern Slav State. It extends from the Danube and Drave rivers westward to the Adriatic. Area, 16,421 square miles; population estimated in 1913 at 2,668,569. Agram is the capital with a population (1910) of 79,038. Prior to the revolution the provincial diet met annually at Agram, and was composed of 19 members who served five year terms. The Ban was the executive head, responsible to the Hungarian Prime Minister and the provincial Diet. Anton Mihalovitch was the Ban at the beginning of 1918.

CROOKES, SIR WILLIAM. British physicist and chemist, died in London, England, April 4. He was one of the most distinguished pioneers in science during the nineteenth century. He was born in London, June 17, 1832; studied at the Royal College of Chemistry; and became superintendent of the meteorological department of the Radcliffe Observatory, Oxford (1854), and lecturer in chemistry at the Chester Training College (1854), but soon engaged in scientific research in London where he made his home for the rest of his life. The external features of his career may be briefly summarized. He founded the *Chemical News* of which he became the editor and proprietor after 1859, and he edited the *Quarterly Journal of Science* after 1864. In 1862 he received a medal at the International Exhibition. He received medals or prizes at successive exhibitions and from various

scientific bodies in 1880, 1881, 1885, and frequently thereafter including the medals of the Universal Exposition at Paris in 1881, the Albert Gold Medal in 1899, and the gold medal of the Society of Chemical Industry in 1912. From 1908 to 1912 he was at various times president of the Chemical Society, the British Association, and the Institute of Electrical Engineers, and member or corresponding member of a large number of the great scientific bodies throughout the world. He was knighted in 1897. In 1907 he received along with Edouard Buchner the Nobel prize for chemistry and in 1910 the Order of Merit. His scientific career was so long and diversified that only the barest summary is here possible. He began publishing in 1851, his first paper being on the subject of the selenocyanides. This marked the beginning of his chemical researches and led the way to his discovery of a new chemical element which he announced in 1861, giving it the name of thallium. He devoted several years to the investigation of its properties, and his researches in its atomic weight led to results which are still regarded as standard. In the course of them he was brought to abandon the idea that air currents were responsible for the loss of weight of bodies on becoming hot and he substituted the theory that there was a repulsion resulting from radiation. His work along this line led to the construction of the instrument known as the radiometer. Meanwhile he discovered the sodium amalgamation process for separating gold and silver from their ores (1865), and developed a new method for the spectroscopic investigation of substances. His studies of "radiant matter" suggested to him the existence of indivisible particles supposed to constitute the physical basis of the universe and marking the stage at which matter and force seemed to merge. His experiments in radiant matter also led to speculations 1886-87 in regard to the genesis of the element. He came to the conclusion that various so-called simple bodies were in reality compound molecules formed by the process of gradual condensation from a single primordial material. He put forth these views in an address to the British Association in 1886, and in subsequent addresses. In 1898 at Bristol he described a new rare earth, monium or victorium. After the discovery of radio activity in 1896 he devoted his studies for a time to the properties of radium and a large number of published works contained the results of these and many other researches during his long and active career. His views as to the genesis of elements were held by physicists as likely to form an important contribution to chemical philosophy as new knowledge of the facts developed. A list of his writings includes the following: *Select Methods in Chemical Analysis* (4th edition, 1905); *Manufacture of Beetroot-Sugar in England* (1870); *Handbook of Dyeing and Calico-Printing* (1874); *Dyeing and Tissue Printing* (1882); *Ker's Treatise on Metallurgy* (1868, with Ernst Rohrig); *Wagner's Chemical Technology, Auerbach's Anthracen and its Derivatives* (2d edition, 1890); *Ville's Artificial Manures* (3d edition, 1909); *A Solution of the Sewage Question*; *The Profitable Disposal of Sewage*; *The Wheat Problem* (1899); *Diamonds* (1909).

CROP PRODUCTION. See *AGRICULTURE*.

CROSS COUNTRY RUNNING AND MARATHONS. Fred Faller of the Dorchester Club,

Mass., won the senior cross country championship of the Amateur Athletic Union. The race was run over the Van Cortlandt Park course, New York City, on November 29th, Faller's time being 32 minutes 26 $\frac{1}{2}$ seconds. Charles Pores of the Millrose A. A., New York City, finished second in 32 minutes 40 $\frac{1}{2}$ seconds. The point trophy went to the Millrose A. A. with 36 points, the Paulist A. C. taking second honors with 45 points. John Simmons of Syracuse University scored a double victory in the sport, capturing both the junior championship and the intercollegiate fixture. His time in the junior event was 33 minutes $\frac{3}{4}$ seconds. Simmons's university took the junior point trophy through the efforts of himself and L. Watson who finished in second place. In the intercollegiate run Simmons covered the Van Cortlandt Park course in 32 minutes 55 $\frac{1}{2}$ seconds. W. K. McMahon of Massachusetts Institute of Technology was second in 33 minutes 12 seconds, and Robert Crawford of Lafayette College third in 33 minutes 25 seconds. The college point trophy was captured by Syracuse which compiled a total of 49 points. Princeton University took second honors with 69 points, and Cornell University was third with 80 points.

The American Marathon held under the auspices of the Boston A. A. on April 19th was won by Carl W. A. Linder of the Hurja A. C., Quincy, Mass. His time was 2 hours 29 minutes 13 $\frac{1}{2}$ seconds. William Wick, also of Quincy, finished second in 2 hours 30 minutes 15 seconds. Max Bohland, the cross country champion of 1918, captured the modified marathon conducted by the New York *Evening Mail*, his time for the 10 $\frac{1}{2}$ miles being 55 minutes 56 seconds. Charles Pores of the Millrose A. A. was second, only 11 seconds behind Bohland. The 10-mile run of the Amateur Athletic Union was won by Fred Faller of the Dorchester Club in 52 minutes 32 $\frac{1}{2}$ seconds.

CRUISERS. See NAVAL PROGRESS

CUBA. A Latin-American republic in the West Indies, comprising the island of Cuba, the Isle of Pines, and small adjacent islands. Capital, Havana.

AREA AND POPULATION. The area is 44,164 square miles, and the population at the close of 1916 was placed at 2,627,536, an increase of 116,438 over the last year. There are six provinces: Havana, Matanzas, Pinar del Rio, Santa Clara, Camaguey, and Oriente, of which Havana has the smallest area and the largest population, namely, 3,174 square miles, and 688,057 population, making a density per square mile of 216.77. The average density for all the provinces is 59.65 per square mile. Oriente is the largest of the provinces, with an area of 14,227 square miles, and a population of 604,530. The city of Havana had a population of 359,259. The whites form 71.9 per cent and the colored 28.1 per cent of the total population. Immigrants in 1918-19 were 42,574. The emigrants in 1917-18 numbered 71,599. A law providing for a new census was passed in 1919.

PRODUCTION. The land finds its principal prosperity in the staple crops of sugar and tobacco. The 1918 sugar crop was 4,048,480 tons. The total area of sugar plantations was 1,384,812 acres, with 211 sugar mills. The value of the tobacco manufactured in 1918 was placed at \$33,829,627. Cuba's production of rum in 1915 was 696,067 gallons; of alcohol, 2,021,116

gallons. At the beginning of 1916 the live stock in the island consisted of 3,703,928 head of cattle; 720,040 horses; 54,264 mules, and 2882 asses. Among other leading products are citrus fruits, cereals, potatoes, and other vegetables, coffee, cacao. Cuba has forest lands many of which are privately owned. The state owns an area of about 1,250,000 acres. These forests contain mahogany, cedar, dye-woods, fibres, gums, resins, and oil. Cigarette boxes are made locally from the cedar, while the mahogany is exported. The chief tobacco-growing region is the province of Pinar del Rio, which supplies the large trade in cigars and cigarettes. Rice-growing has recently been developed. There are rich mineral resources, especially in the province of Oriente. Iron, manganese, copper, zinc, lead, gold, potash, asphalt, salt, and petroleum are found in abundance. In the district of Santiago de Cuba copper, manganese, and iron mines are being developed. There were about 4000 workmen employed in the iron mines in 1919 and the exports to the United States had averaged 50,000 tons a month. In 1919 trade journals indicated an increase in the development of manganese and the export of iron ore.

COMMERCE. In the fiscal year 1918-20, the imports were \$315,587,167, exports, \$477,221,963; re-exports, \$93,113. For the year 1919, the principal exports arranged in the order of their importance were Sugar, unmanufactured tobacco, iron, gold, and copper ores, manufactured tobacco, molasses, hides and skins, distilled products, vegetable fibres, woods, bee-products, fruits, grain, and sponges. Imports by countries, arranged in the order of their importance, for the year 1919, were: United States, United Kingdom, Spain, France, British India, Uruguay, and Porto Rico. Exports by countries were: United States, United Kingdom, Spain, France, Italy, Netherlands, and Argentina respectively.

COMMUNICATIONS. For description of railway system, see preceding YEAR BOOK. In 1919 a branch line was projected to connect the Fomento-Casilda line with Manicaragua. There were 1235 miles of cart road open to traffic on April 1, 1918. At this time there were about 660 post offices, 230 telegraph offices, and 9 wireless stations operated by the government. In 1916, 5540 vessels of 8,164,145 tons entered and 5477 of 8,144,317 tons cleared; in the coasting trade 14,684, of 2,582,829 tons entered; and 14,712, of 2,584,211 tons cleared.

GOVERNMENT. A law promulgated by the President on January 18th repealed the law of August 3, 1918, establishing obligatory military service. Amnesty was granted to violators of the repealed law and to persons convicted of crime and misdemeanors committed for the purpose of evading military service before Dec. 31, 1918. The cabinet consists of secretaries of State, Justice, War and Marine, of the Interior, of Finance, of Agriculture, Commerce and Labor, of Public Instruction, of Public Works, and of Sanitation and Charity. In 1919 the President, Gen. Mario G. Menocal (succeeded Gen. José Miguel Gomez, May 20, 1913—re-elected in November, 1916, for the term expiring May 20, 1921).

Early in the year one of the subjects drawing attention was the need of reforming the Cuban electoral whose defects the present administration had recognized and promised to remove. A bill was introduced for this purpose providing

for an obligatory vote, the finger-print method of identification, and the public counting of the ballots. The United States War Department agreed in February to send Provost Marshal General Crowder to Cuba to advise with the government in regard to the revision of the electoral law. It was he who while serving with the American army of occupation in Cuba had provided the existing laws and had supervised the first presidential election. Labor troubles approaching even the dimensions of a general strike were reported early in the year.

CUDAHY, PATRICK. Meat packer, died at Milwaukee, July 25. He was born at Callan, Ireland, March 17, 1849. He came to the United States in 1849 and was educated in the Milwaukee public schools. He began his business life as delivery boy for a grocer and at 14 entered a packing company and rose to the position of superintendent in 1874 and partner in 1876. In 1888 he established the firm of Cudahy Brothers and five years later moved the plant to Cudahy near Milwaukee. The firm became one of the largest and most important companies in the United States. He was president of it until 1915 when he retired.

CUDEBACK, WILLIAM HERMAN. American jurist, died at Goshen, N. Y., August 16. He was born in Orange County, N. Y., March 25, 1852, and was admitted to the bar in 1877, and practiced at Goshen 1877-85 and at Buffalo 1885-1913. He was prominent in Democratic politics and was corporation counsel of Buffalo, 1898-1902. He was appointed in 1913 Associate Justice of the New York Court of Appeals for the term 1913-26.

CUMBERLAND PRESBYTERIAN CHURCH. Founded in 1810 as a separate presbytery of the Presbyterian Church because of the refusal of the officers of the Kentucky Synod to allow this group of churches to appoint the ministers it chose, this denomination has had an eventful career. The Rev. James McGready, the leader of the "revival" movement, and generally looked upon as the father of the Cumberland Presbyterian Church, never favored it and never identified himself with the independent body. The new church grew rapidly, until in 1820 there were four synods and a general assembly. The fact that the strength of the church was in the border States made it inevitable that the slavery question should become prominent, and during the Civil War the denomination was barely saved from disunion. Then came the question of the negro churches, resulting in a mutual agreement for the establishment of the Colored Cumberland Presbyterian Church, as affording to the negroes the opportunities they needed most for church development. In 1904 the General Assembly effected a union with the Presbyterian Church in the United States of America, but strong opposition in the Cumberland Presbyterian Church resulted in the formation of a new General Assembly and a legal fight to obtain possession of the church property with varying results.

Missionary work is carried on in China where four churches are maintained with about 600 members, while considerable work is done in America among the Indians.

The latest available statistics (1916) show 1317 organizations, with 72,052 members, a decrease of 123,718 from 1906, value of church property, \$1,935,072. There were 909 Sunday

schools, with 6618 officers and teachers, and 53,431 pupils. All figures show a loss of about 65 per cent over the same figures for 1906. The educational interests of the denomination are represented by Cumberland College, at Leonard, Tex., and Cumberland Presbyterian Theological Seminary, at McKenzie, Tenn. *The Cumberland Presbyterian*, is published in Nashville, Tenn., and the *Cumberland Banner* is published in Tullahoma, Tenn.

The Cumberland Presbyterian Church (Colored) had, according to the latest available statistics (1916) 136 organizations, 13,077 members, and 132 church edifices. Church property was valued at \$230,426. There were 139 Sunday schools, with 928 officers and teachers, and 7471 pupils. Figures show a loss from corresponding figures in 1906 of about 30 per cent. *The Colored Cumberland*, a semi-monthly periodical, is published in Milan, Tenn.

CURAÇAO. A colony of the Dutch West Indies, with an area of 436 square miles and had a population (Dec. 31, 1917) of 57,619. The islands of Curaçao, Bonaire, Aruba, St. Martin (the northern part of which belongs to France), St. Eustache, and Saba compose the group. The government consists of a Governor and three members of a council appointed by the Sovereign and presided over by a Vice President. There is also a Colonial Council of 13 members, nominated by the Sovereign. In the 1919 budget the revenue is estimated at 1,018,834 guilders, and the expenditure at 1,812,566 guilders, the difference being supplied by the mother country. The chief products are maize, beans, pulse, cattle, salt, and phosphate of lime. Oil refining is the chief industry. The ports of the various islands show an entrance of 3773 vessels in 1917, of 1,325,242 tons net.

CURRENCY. See BANKS AND BANKING; COINS, VALUE OF FOREIGN, and FINANCIAL REVIEW.

CYCLING. Frank L. Kramer, the "grand old man of the wheel," was dethroned as sprint champion in 1919 by Raymond Eaton. Kramer compiled a total of 33 points in the various races as against 39 secured by his rival. The amateur sprint laurels were won by Charles A. Osteritter with 24 points. Anthony Young was second with 12 points.

The annual six-day race held at Madison Square Garden, New York, attracted the largest crowds in the history of this event. At the end of the long grind all the teams remaining on the track were tied with 2501½ miles to their credit, but according to the rules the winner was to be determined by the number of points scored in the various sprints held during the week. These showed that Goulet and Madden were the winners with a total of 818 points. Egg and Dupuy finished second with 684 points, and McNamara and Magin third with 633 points.

CZECHO-SLOVAKIA. A republic whose independence was proclaimed on Oct. 21, 1918, and which came into existence with the definite organization of a government at Prague on Oct. 28, 1918. It was formally proclaimed a republic on the following day. The movement toward its formation had been rapid since the latter part of 1917, and it had been recognized as an independent state by Italy on April 23, 1918; by Great Britain, Aug. 3, 1918; by the United States, Sept. 2, 1918; and by Japan, Sept. 9, 1918. Before that Premier Clemenceau of France, on

Dec. 10, 1917, had authorized the organization of a Czecho-Slav army. The constitution was drafted at Geneva, Switzerland, Nov. 2, 1918, and on Nov. 14, 1918, the National Assembly met at Prague and formally proclaimed a republic with Prof. Thomas Garrigue Masaryk as its first president. It consisted of the four former Austrian states of Bohemia, Moravia, and part of Silesia, and the portion of Hungary known as Slovakia.

AREA, POPULATION, ETC. Its area has been estimated at 52,000 square miles. The area of Bohemia is 20,065; of Moravia, 8584; of Silesia, 1988. Figures for Slovakia are not available, but its area has been placed in the neighborhood of 30,000 square miles. The population according to the census of Dec. 31, 1910, was: Bohemia, 6,769,548; Moravia, 2,622,271; and of Silesia, 756,949. Of Slovakia, the estimated population in 1919 was between 3,000,000 and 4,000,000. It should be noted that the above estimates are inexact for the present time and that the total area has been placed as high as 60,000 square miles with a total population of about 13,000,000. The frontiers were to be determined at the Peace Conference. At the beginning of 1919 they were as follows: On the north the frontier of Hungary remained the same; on the west the line followed the Hungarian frontier as far as the Danube, then followed the Danube to the outlet of the Eipel, and then along the Eipel as far as Rimas to Zombat, whence it passed to the mouth of the Ung River, then followed the Ung as far as the Uzsok heights. The recognition by the Hungarian ministry of the autonomy of Slovakia on March 10, 1919, raised the question of determination which was not settled in 1919. The estimated population of the chief towns on June 30, 1914, was as follows:

Prague and environs	550,000	Ústí	40,000
Brno	185,000	Budějovice	40,000
Pilsen	85,000	Vitkovice	30,000
Přerov	85,000	Kladno	25,000
Kosice	48,000	Pardubice	22,000
Moravská Ostrava	42,000	Olomouc	20,000
Luberec	10,000	Stávlmice	20,000
		Nitra	20,000

The dominant religious element is Catholic, but no later figures are available than those of the census of 1910 which are given in the preceding issues of the YEAR BOOK under the title AUSTRIA-HUNGARY. Later statistics than those already given in the previous YEAR BOOKS under that title are not available for education. Elementary instruction is compulsory between the ages of 6 and 14, and secondary education is provided in gymnasia and other secondary schools. There are three universities of which two are in Prague (one being Czech, the other German), and one in Pressburg. Only 2 per cent of the population were reported as illiterate. The figures for production, industry, etc., are included in the previous issues of the YEAR BOOK under AUSTRIA-HUNGARY, no later ones being available. It was estimated that in Bohemia direct taxes before the war amounted to 88,000,000 crowns a year, and indirect taxes to 250,000,000 crowns. Expenditure for 1919 was estimated at 3,000,000,000 crowns.

FINANCE. The first budget was presented by the minister of finance to the National Assembly in May. The expenses amounted to 3,800,000,000 crowns, from which certain extraordi-

nary items were to be deducted, leaving a net amount of 3,118,000,000 crowns. Some points of interest in the financial situation may be briefly mentioned. It was estimated that the current income would amount to about 2,310,000,000 crowns, the current expenses to about 2,120,000,000 crowns, and the excess income to about 182,000,000 crowns, but this was on the assumption of peace conditions, whereas the country was practically on a war footing, as it was necessary to maintain an army of some 370,000 men on account of the situation in Hungary and Siberia. The military enterprises had cost as much as 460,000,000 crowns and to this 1,150,000,000 crowns had to be added on account of aid to the families of soldiers and to the demobilized troops that had formerly served with the Hungarian and Austrian armies, and who were either out of work or invalided. Moreover, there was a serious industrial crisis entailing heavy expenses in relief to the civilian population. This was estimated as involving 216,000,000 crowns more. On account of the low exchange rate the government was obliged to supply food stuffs to the population below the cost price abroad, and this item added some 220,000,000 crowns to the expenses. Finally the increased wages of state employees added 865,000,000 crowns and the railway system being in a deplorable condition threatened to show a deficit of 400,000,000 crowns. The financial policy was not based on loans, but on a series of new taxes, namely, on interest paid on current accounts of banks and other institutions at 6 per cent; a progressive supplement to the land taxes; a tax on commercial turnovers; a special tax on the registration of foreign companies; a stamp duty on foreign premium bonds; stamp duties for tenants' contracts; tax on the coal output amounting to 20 per cent of the price; tax on wine and the increased duty on alcohol; and a duty on traffic. These taxes and duties were expected to yield the sum of 750,000,000 crowns. Plans of railway readjustment were expected to increase railway returns by 500,000,000 crowns. It was further proposed at the end of the financial year to levy a tax confiscating a part of the excess profits due to the scarcity of food and raw materials. A plan for a heavy imposition on capital was being carried out during the year. Private and collective fortunes of all descriptions were being registered, and it was designed to confiscate the vast percentage of the excess profits and thus remedy the unhealthy inflation of values.

ECONOMIC CONDITIONS. Problems of reconstruction were extremely difficult, for the country had not only suffered during the war, but inherited bad financial and industrial conditions from the Austro-Hungarian régime. It was estimated that the Czech countries before they had been separated from the empire produced 85 per cent of the cotton output, and 95 per cent of the wool output in Austro-Hungary. To the Czech countries also some 70 per cent of the metal output of Austro-Hungary was attributed; 50 per cent of the motor-car output; and 60 per cent of the aluminum goods industry. Under the empire the system of taxes was based partly on excise raised on alcohol and beer production. This yielded in 1919 only about 8 per cent of its figure before the war, for the production was reduced in order to keep up the food supplies and the raw materials.

GOVERNMENT. The working out of the constitution was left to the National Assembly. Its principles were indicated in the declaration of independence of Oct. 18, 1918, as involving freedom of conscience, religion, the press, assembly, petition, speech, science, literature and art; separation of church and state; universal suffrage; equal rights of women in all respects; proportional representation; equal rights for national minorities; the parliamentary form of government; and the initiative and referendum. The National Assembly numbered 260 members and was composed of all political parties which were represented as follows: Agrarians, 54; Social Democrats, 50; Slovaks, 50; State Right Democracy, 44; Socialists, 28; Clericals, 28; Progressive party, 6. The first president as noted above was Thomas G. Masaryk. The first government, known as the government of national concentration, was appointed Nov. 14, 1918, and was composed as follows:

Prime Minister, Dr. K. Kramár (State Right Democrat)
 Minister of Foreign Affairs, Dr. E. Benes (Realist)
 Minister of the Interior, M. Svehla (Agrarian).
 Minister of War (vacant, May 5, 1919)
 Minister of Public Instruction, M. Haberman (Social Democrat)
 Minister of Finance, M. Rasín (State Right Democrat)
 Minister of Agriculture, M. Prásek (Agrarian)
 Minister of Commerce, M. Stránský (State Right Democrat)
 Minister of Posts, M. Strišný (Socialist).
 Minister of Public Works, M. Staněk (Agrarian)
 Minister of Public Health, M. Šrobár (Slovak)
 Minister for Home Defense, M. Klofáč (Socialist)
 Minister of Supplies, M. Vrbenský (Socialist)
 Minister of Public Welfare, M. Winter (Social Democrat)
 Minister of Railways, M. Zahradník (Agrarian)
 Minister without Portfolio, M. Hruban (Catholic)
 Minister of Justice, M. Šaukup (Social Democrat)

The area of Slovakia is not definitely known, but is estimated at about 30,000 square miles, and the population at from 3,000,000 to 4,000,000. The Hungarian government at that time in power recognized on March 10, 1919, Slovakia as an autonomous territory, but its boundaries were not fixed.

THE CZECHO-SLOVAK POLITICAL PROGRAMME. The general principal of the programme of the new state was set forth by the President, Masaryk, at the session of the National Assembly at Prague, held on October 28th to commemorate the anniversary of the founding of a republic. These principles had to do with ultimate aims and not with temporary policies. President Masaryk was celebrated long before the war as a writer of scholarly works on history, literature, and economics, and he ranked among the leading authorities as a student of social changes in the nineteenth century and later, and especially as an investigator of the origin, theory, and development of various shades of socialism and anarchism. He was the leading patriot in the movement for the Czecho-Slovak state, and was received with enthusiasm in his visits to America and to other countries of the Allies, when he was seeking to arouse sympathy for his cause. After the organization of the republic, he was everywhere regarded as the right man for the presidency. During the first year of the country's history he won a reputation as one of the ablest statesmen in Europe. In his address on this occasion as well as in his other writings he showed that he regarded Bolshevism as an impossibility, and he condemned Lenin's

programme as a form of revolutionary trade unionism inconsistent with the principle of Karl Marx himself. Karl Marx, he said, looked for a high social and economic development, while Lenin and his policies would relegate development to the primitive stage represented by the illiterate Russian peasant. But President Masaryk disapproved of intervention in Russia or Hungary, holding that Russia like every other nation passing through such a crisis must help herself, and that Bolshevism could not be checked by military measures, but only by social reform and political education. He believed that Bolshevism would fail, but warned people against deriving from that fact arguments for reaction. To him Bolshevism was a form of preliminary and abortive socialism, though its ultimate aims were not very different from those of the moderate party in central Europe and in Russia. The watchword that he advocated for his country was thorough social reforms without bloodshed. He looked for the socialization of the means of production, but realized the difficulty in his way on account of the abnormal conditions following the war, and said that the working classes might for a while be worse off than they had been, and that for the building up of a new order sacrifices were demanded of them as well as from the capitalist class. He opposed a dictatorship and any other form of violence as always injurious. But in the long run the socialization that he had in mind would involve the public control of the whole economic life, with the result that the public would demand a balance sheet of every industry in the future just as it now demanded a budget from the state. President Masaryk concluded his address by saying that he looked upon socialization, not only as economically, but as morally sound, and that he did not believe it was a matter of mere materialism, but that at any rate he could put up with the materialism of the hungry more easily than with that of the over fed. These principles were manifestly in direct contradiction to those of the governing classes of the leading countries of the Allies, including the United States among the Allies, and radicalism carried to any such point would have been instantly condemned by leading journals and public men in England, France, and America. There was not, however, evidence of any disposition to criticize it on the part of those countries.

As noted in the preceding YEAR BOOK Prof. T. G. Masaryk was elected in November as President of the new government. He had been chairman of the Czecho-Slovak National Committee. This election, which was held by representatives of the eight political parties assembled at Geneva, Switzerland, was ratified on November 10th by the National Assembly and Dr. Karl Kramarz was chosen Premier and Vojta Benes Minister of Foreign Affairs. On December 20th President Masaryk assumed his office. Serious boundary disputes confronted the new state, on the one hand with Poland (See POLAND) and on the other with Hungary. There were also serious troubles of a political nature owing largely to the policy of Premier Kramarz who favored the maintenance of large landed estates, which policy was exposed to the growing opposition on the part of the Agrarians and Socialists and finally led to the downfall of the Kramarz cabinet. A new ministry consisting only of Social Democrats and Agrarian Socialists

headed by the Socialist Vlastimil Tusar, as Prime Minister, succeeded to power. Mixed commissions were called upon to decide the dispute between Czecho-Slovakia and Poland in respect to the region of Teschen.

On March 1st it was announced that the commission on the frontiers had decided to include all of historic Bohemia.

GENERAL CONDITIONS. A summary of the first year under the new republican government indicated that in the main the country had made fair progress, considering the difficulties that it had to encounter. After the armistice in 1918 the economic condition was menacing. There was a scarcity of food and clothing. Frontiers had not been fixed and there was no army capable of defending the state, or administration capable of orderly government. This was the situation that the new government under M. Kramarez had to face. In the autumn of 1919 conditions were still difficult. The cost of living was high, the rate of exchange unfavorable, and the problems of provisioning, and of coal shortage were serious. The first budget showed a marked deficit and conditions of life were far from normal. But in the meanwhile, the frontiers had been fixed, and the only question to be settled was that of Teschen which was reserved for a plebiscite. The German claims in Bohemia had been abandoned after the peace. The Hungarian invasion of Slovakia had caused much damage. Much was said in the press about a movement for self-government in Slovakia where there was much discontent with the present arrangement. This, however, was denied in other quarters, especially by the French, who were staunch supporters of the new republic. It was said that Slovakia as a whole was firmly attached to the new state and that the movement for self-government had encountered public demonstrations of hostility in all the principal cities. The army had been organized under the direction of French officers. Provisioning was improving and crops were said to be abundant in Bohemia, Silesia, Moravia, and Slovakia, although on account of the lack of reserve supplies importation was necessary. The government was making efforts to provide for the lack of necessities and raw materials, and to relieve the shortage of transport and coal. It was also endeavoring to promote exportation. As to the financial situation, the rate of exchange had become very low, but had recovered somewhat. The government was planning to issue an internal loan and endeavoring also to obtain credit abroad. Good order was reported throughout the country even in the region of Teschen, and a monarchical plot reported in the press in December was said to have had no importance. Plans were being made for the holding of a new National Assembly to replace the present one which had been established as the result of agreement among the different parties.

RAILWAY QUESTION. The head of the transport service in the new republic made the following report as to conditions on the railways: It pointed out that the territory on the new map of Europe formed an irregular rectangle narrowing from west to east, and having about 150,000 square kilometers. The situation in the centre of Europe rendered its railway system particularly important. Practically all the transit from north to south would have to pass over Czecho-Slovak lines. The exports of Ger-

man manufactures, for example, into south Europe would have to pass through Czecho-Slovak territory, and it would be the same for the agricultural products coming from southeastern Europe, especially the Balkans and Rumania. Moreover, in regard to passenger traffic it was plain that the great through express trains would have to cross this territory. Therefore the Allies in their own interest would hardly fail to use the Czecho-Slovak route. On three sides the new republic was surrounded by its former enemies, and free access to the sea was a question of life and death. He had no doubt that the Peace Congress would recognize this just claim. The best means of joining the railway lines with a seaport would be the creation of a "corridor" between Czecho-Slovakia and Yugoslavia, which would have the good result of promoting friendly relations between the two neighboring states and would throw a great burden upon the Czecho-Slovak lines which at that time had a total length of 13,500 kilometers, about 60 per cent belonging to the state. During the Austro-Hungarian régime they had suffered much from the hostile railway policy of their rulers, for Vienna had always been favored to the disadvantage of Prague, the lines between Vienna and Budapest were better kept up than the others, and the important centres were always established on German territory. Lines were carried at a distance from Prague in order to conceal from foreign tourists the attractiveness of that city. The system, inherited from the Austro-Hungarian Empire, was therefore in a wretched state, especially in the matter of rolling stock. After the armistice the Magyars had robbed the country of hundreds of locomotives and cars, and the material was utterly inadequate. At this moment the administration of the railways had to contend with the difficult problem of supplying the means of transit for the provisioning of the country and these difficulties were aggravated by lack of coal as well as by the loss of man power. The financial situation was bad. The budget presented to the National Assembly in 1919 showed a deficiency of more than 400,000,000 crowns, and the situation was worse on account of the distribution of the lines which all converged toward Vienna and Budapest, and did not answer to the needs of the new republic. The system in Slovakia especially was practically unworkable. It would be necessary to complete new lines joining Slovakia with Moravia and Bohemia. A complete renewal and organization was necessary.

THE QUESTION OF STATUS. For 300 years Bohemia had been in revolt against Austria. Her liberties had been suppressed after the battle of Black Mountain in the seventeenth century, and thus began a long period of religious intolerance and Germanization. At the time of the Congress of Vienna, while the fate of Italy and Poland was considered, the claims of the Czecho-Slovaks was not even mentioned. Its demand at the close of the war was that a new state should be set up with some 12,000,000 or 13,000,000 inhabitants. There were serious difficulties in the way, owing to the great damage done by the war, and also to the fact that the Germans had everywhere penetrated the country forming three principal groups which numbered from 1,500,000 to 2,500,000. For many years these Germans had carried on a Pan-German propaganda against the Czecho-Slavs. As-

similation of the two races was out of the question; nor could these three German regions be separated from Bohemia, for they contained great mineral wealth and factories essential to economic life. On the other hand, the German population could not survive if it did not find in Bohemia the market for its industrial products. Moreover, there were several Czech enclaves entirely surrounded by Germans. In short, Bohemia though geographically a unit, was not ethnographically a unit. The confused condition from the ethnical point of view was the result of German expansion and Magyar invasion. The problem before the great Powers therefore was extremely difficult. If the principle of nationalities was strictly applied, the result would be the partitioning of Bohemia, and life would become impossible for the two nationalities that lived side by side in the country. On the basis of geographical necessity there could be no adjustment of boundary between the Czecho-Slovak state and Poland on the one hand, or between it and Hungary on the other. A suggested solution was that Bohemia, Moravia, Silesia, and the Slav countries which had been taken from the Hungarian kingdom should not be considered alone. Regard must be had besides to the interdependence of the races of central Europe, and to such a grouping of them as would give to each the best frontiers possible consistent with their existence in common. It was necessary to devise a grouping that would preserve effectually central Europe against Prussian domination, and of such a system the Czecho-Slovak state would be the keystone.

THE REVOLUTION. Though the following events did not occur in the calendar year 1919, information in respect to them was not available in time to include them in the previous YEAR BOOK, so a summary is here supplied. The antecedents of the Bohemian movement for independence date many years back. For three centuries in fact Bohemia had endeavored to regain the liberty that she lost in the battle of the Black Mountain in 1620. Patriotic propaganda had been carried on through journalism, local committees, and other bodies for many years, and persisted in spite of the persecution by the Austrian military and police. Many secret societies were formed including one that used the name Mafia, borrowed from the famous Sicilian society. It was so organized that each conspirator knew only two members of the society and worked with them; and the chief of the organization, Dr. Szamal, was the only one who knew all the members. This body succeeded in maintaining communications between the Czecho-Slav committee in Paris and the politicians at Prague and Vienna. It organized a system of spies and stole documents from the enemy. It was said to have taken in this manner documents from the offices of Count Stürckh, Austrian Prime Minister. Women and children participated in this espionage. Among those who were concerned in the conspiracy were Dr. Benes, Dr. Stanek, afterwards Minister of Labor, Dr. Stepanek, afterwards Minister to Paris, Dr. Borsky, Minister to Rome, and other prominent men. As the result of these activities the Czechs were kept informed of the most secret designs at military headquarters or at court. It was said that they had learned even what the Emperors William and Charles had decided upon at their last interview. They employed invisible ink and

resorted to other methods which prevented detection. At one time they published an apparently innocent review in which by chemical process the intermediate lines could be read. Toward the end of September the head of the secret society, Dr. Benes, told the conspirators to be ready for the revolution. On October 29th the Czecho-Slav committee was master of Prague. The Austrian government had fled, the generals had laid down their arms, and the capital celebrated its liberation. At the same time the news was brought that the Czecho-Slav state had been recognized by the entente, with Thomas Masaryk as President.

DAHOMEY. A French West African colony, extending from Togoland on the west to Lagos and Nigeria on the east and to the French military territories in the north. Dahomey forms part of the government-general of French West Africa (q.v.). It has about 70 miles of coast line, with, however, an extensive hinterland. According to a recent estimate of the population, there were 900,000 (1917), which includes 457 Europeans. The majority of the natives are fetish worshippers (about 800,000), while there are also 70,000 Mohammedans, 20,000 Roman Catholics, and 5000 Protestants. The capital is Porto Novo, which is also the chief business centre, with about 20,000 inhabitants. Other towns of importance are: Abomey (12,372); Ouda or Whydah (13,000); Grand Popo (2115); Cotonou (2456). The principal imports are: Cottons, machinery, liquors, and tobacco; the exports: Maize, palm kernels (5,980,988 francs in 1917), palm oil (9,432,320 francs in 1917), copra. The exportation of kola nuts and of rubber is decreasing. An iron pier has been erected at Cotonou, and from that port a railway is being constructed to run into the interior as far as Chaoru (400 miles). At present about 176 miles have been constructed, with a gauge of a meter. There is also a meter-gauge railway running between Porto Novo and Pobé (50 miles) along the Lagos frontier. The budget for the colony for 1918 reached the sum of 5,475,860 francs. The local budget for 1918 reached 4,942,985 francs. The imports for 1915 and 1916 were, respectively, £425,250 and £695,230, and the exports £526,571 and £751,242. There are 1389 miles of telegraph line and 70 miles of telephone line.

DAIRY EXPORTS. See DAIRYING.

DAIRYING. During 1919, the dairy situation in the United States became much more stable than during the previous two years. Much of the uncertainty and unrest was eliminated and production considerably increased. The dairy cow population remained almost stationary. The number of milk cows in this country on Jan. 1, 1919, was 23,467,000, an increase of 157,000. Most of the Northern States had about the same number as the year before, while a few showed a decrease. Each of the South-eastern States, however, increased the number of dairy cows.

The feed situation was considerably relieved with better shipping facilities and with no restrictions. The prices of feeds, however, were somewhat higher than during the previous year. With the return of the soldiers and the men from the industries to the farms, the labor situation was improved, with the result that although the number of milk cows had not increased, production showed considerable gains during the

year. Creamery butter increased 50,000,000 pounds, while condensed milk made the enormous gain of over 300,000,000 pounds. The production of cheese, on the other hand, was 20,000,000 pounds less than the year before.

The following table gives the trend of factory production for the years of the war.

THE FACTORY PRODUCTION OF DAIRY PRODUCTS IN THE UNITED STATES

	<i>Creamery butter</i>	<i>Factory cheese</i>	<i>Condensed milk</i>
1914	786,003,489	377,573,409	875,507,438
1916	760,030,573	314,716,739	997,835,115
1917	743,895,068	372,540,203	1,353,605,594
1918	793,289,301	352,621,615	1,675,477,360
1919 (6 mo)	417,006,215	141,972,534	1,031,476,106

FOREIGN TRADE IN DAIRY PRODUCTS. During the years of the war, the exports of dairy products from the United States increased, while imports decreased, although before the end of the year the tendency was toward pre-war conditions, when the imports of dairy products to the United States exceeded its exports. During the first half of the year, however, the exports of butter were heavy, amounting to 33,739,960 pounds. This is the largest amount exported from the United States for more than 20 years. Cheese decreased to less than 19,000,000 pounds, which is the least exported since 1914. The condensed milk which was exported in increasing quantities during each year since 1914, going largely to the armies, continued to be exported in even larger quantities after demobilization, this product for the past year going largely to the civilian population instead of to the armies. The exports of condensed milk during 1919 amounted to 728,740,509 pounds.

The following table shows the trend of foreign trade in dairy products of the United States since the beginning of the war. It will be noted during that period that this country changed from a net importer to an exporter of dairy products of considerable quantities.

EXPORTS AND IMPORTS OF DAIRY PRODUCTS, UNITED STATES

<i>Fiscal Year</i>	<i>Exports (domestic)</i>	<i>Imports for consump- tion</i>	<i>Excess of exports over imports</i>	<i>Excess of imports over exports</i>
Condensed milk.				
1914	16,209,082	14,951,086	1,257,996
1915	37,235,627	33,613,389	3,622,238
1916	159,577,620	18,173,426	141,404,194
1917	259,141,231	18,356,416	240,734,815
1918	528,759,232	29,926,931	498,832,301
1919	728,740,509	20,183,723	708,556,786
Cheese:				
1914	2,427,577	64,497,470	62,069,893
1915	55,362,917	48,097,118	7,265,799
1916	44,394,301	31,420,537	12,973,764
1917	66,050,013	14,685,866	51,364,147
1918	44,303,076	8,582,717	35,720,359
1919	18,794,853	2,442,306	16,352,547
Butter:				
1914	3,693,597	7,788,390	4,094,793
1915	9,850,704	3,695,882	6,154,822
1916	13,487,481	720,961	12,766,520
1917	26,835,092	523,808	26,311,284
1918	17,735,966	1,596,633	16,139,333
1919	33,739,960	4,131,469	29,608,491

(The 1919 figures are from the Monthly Summary)

On account of the loss of cattle in Europe during the war, there has come to this country a demand for dairy cows, but because of the

high cost of transportation and the scarcity of feeds for cattle in Europe, only a comparatively few animals have been shipped. An order was placed by the French Government for a great many dairy cows largely of the Holstein breed, but after 12,000 had been shipped, it was found that feeds would not be available for more, and shipments were discontinued.

The milk situation has become somewhat more settled, and the consumption in the cities has increased. The prices have remained about the same as last year, with slight increases in some sections. The system of paying for milk on the basis of the cost of production has been somewhat changed, notably in large consuming centres of the East where an effort has been made to base the price in a manner to give consideration to the supply and demand. The New York commission has, during the year, paid for milk on the basis of market prices for butter and cheese.

PRODUCTION OF CHEESE OF FOREIGN VARIETIES. The United States normally imported more than 50,000,000 pounds of cheese annually, largely of special varieties made in Europe. The supply of these was almost entirely cut off during the years of the war, and this stimulated investigations in the methods of production of these varieties in this country. Investigators in the Department of Agriculture during the year were successful in isolating the organism which causes the flavor and eyes of Swiss cheese. As a result of this discovery, along with the use of a culture known as *Bacillus bulgaricus* which controls the organisms that may be present in the milk, a high class American Swiss cheese is now being made on a commercial scale.

Camembert cheese, which was also formerly imported, is now being made in increasing quantities in this country.

Perhaps the most notable success in cheese manufacture has been the production on a commercial scale of American Roquefort cheese. Heretofore, this product had been made in no other place than a limited section in Southern France where natural caves were responsible for the particular curing which seems necessary for the manufacture of this type of cheese. The natural condition of these caves was imitated by refrigerators constructed with temperature and humidity control. An excellent product is now being made in this country on a commercial scale.

ICE CREAM. There has been an enormous increase in the consumption of ice cream in this country during the past year. It is believed that this has been influenced by prohibition. The increase in some of the States has amounted to as much as 50 per cent, and for the entire country the quantity is so large as to have a material effect upon the whole dairy industry.

CATTLE BREEDING. The year has shown much progress in the development of dairy cattle in this country. It is realized by the dairymen that high production is an important factor in economical production, and the surest way of decreasing the cost of production and meeting foreign competition will be through animals with high production. Indications are that the production per cow is increasing, although it is far short of the average production of cows of some other countries.

BETTER SIRE CAMPAIGN. The importance of breeding is shown by the campaign that has been

inaugurated by the Department of Agriculture to eliminate scrub sires from the herds of this country. The department, in coöperating with the States, is offering a certificate to each farmer who uses pure bred sires on his farm. In addition to this, bull associations are being established throughout the country. The purpose of these associations is to decrease the cost of sires and to use good sires on several farms for as long a period as they are useful. There are in this country more than 5,000,000 farms with dairy cows with an average herd of about five animals, while there are less than 500,000 good sires. The bull associations own the bulls jointly, whereby one sire may serve from 8 to 10 small herds. These associations have made much headway during the year.

MILK BY-PRODUCTS. In the manufacture of butter and cheese, enormous quantities of buttermilk and whey are left as by-products. These have not been fully utilized as food in this country, and with the increasing price of foods, there has come a tendency to utilize these products in various forms. Buttermilk is being converted into cottage cheese and casein, while the whey is being made into a type of cheese, and investigators in the Department of Agriculture have devised a method of extracting the albumen into a powder which is soluble in water. It is believed that this product will become useful in cooking and baking, to take the place of eggs to some extent.

CANADA. Much the same conditions prevail in Canada as in the United States. The dairy cow population has increased slightly, with 3,547,437 as compared with 3,543,600 milk cows last year. Even with this slight increase, the production has gone up considerably in the case of butter and condensed milk, while the cheese production has slightly decreased. The surplus of products has largely gone to England.

ARGENTINA. There has been some increase in the production of dairy products, stimulated by the demand from Europe. Previous to the war, Argentina showed a net import of dairy products, while now there is a rather large export. Practically all of the surplus is being contracted for by Great Britain.

AUSTRALIA AND NEW ZEALAND. In these countries dairying has prospered during the past year. Production has increased, as well as prices for the products. The surplus was contracted for by the British government. The north island of New Zealand, however, has suffered on account of the exceedingly dry weather, which has continued over a long period. This reduced the production more than 25 per cent and necessitated economy in milk consumption in the cities of New Zealand. Much attention is being given to the dried milk industry. Because of the distance to markets, the producers of New Zealand are expanding the manufacture of this product. During the year, equipment has been secured from the United States for the manufacture of milk powder.

EUROPE. Efforts are being made in all parts of Europe to return to pre-war conditions in the dairy business. England, which normally imports large quantities of dairy products, has been obliged to secure her butter, cheese, and condensed milk from other countries than she did before the war. Formerly it secured butter largely from Denmark, Siberia, France, Canada, and New Zealand. During this year, however,

it purchased the entire surplus from Argentina, Canada, New Zealand, and Australia, and also secured considerable quantities from the United States. On account of disorganization, Siberia has not sent butter into the world's trade. Denmark, Holland, and France have been unable to get back to pre-war production, largely on account of lack of feed. The latter country, however, lost many cattle through invasion. The dairy herds of Europe have not suffered as heavy losses as was first believed. England apparently has about the same number of dairy cows as before the war, and Denmark and Holland when the young cattle are included, also have about their normal numbers of dairy cattle. France, however, has probably lost in the neighborhood of a million. Belgium, of course, suffered a great loss of dairy cattle, as did also northern Italy. An effort is being made to build up the herds and get back to normal production, but the shortage of feed, more than the number of cattle, has prevented this. This is also true of Switzerland, which, like Denmark and Holland, depended largely upon Russia, Egypt, and the United States for certain concentrated feedstuffs. Central Europe suffered some loss in dairy cattle during the war, but here also the production has been limited on account of lack of concentrated feeds for the animals. The five important dairy countries of Europe, namely, Denmark, Netherlands, France, Italy, and Switzerland, are all producing considerably below normal, chiefly on account of lack of feeds for cattle.

DALLAS, TEXAS. See CITY PLANNING.

DALLAS, W. D. Meteorologist, died August 5. He was assistant in the Meteorological Department to the Government of India from 1882 to 1906.

DALMATIA. Before the collapse of the Austro-Hungarian Monarchy, a crownland of Austria with Bosnia and the Herzegovina on the east and the Adriatic Sea on the west, from Croatia to Montenegro. The area is 4956 square miles, population Dec. 31, 1910, 645,666; estimated in 1913, 667,648. The Austrian census of 1910 placed the number of Austrian subjects at 634,855 of whom Croatian was spoken by 610,669, Italian by 18,028, and German by 3081. The Catholics numbered 539,074 and the Orthodox Greeks 105,338. Capital, Zara, with a population of about 14,000 (1910). Other important towns. Spalato (about 21,000); Ragusa (about 9000); and Cattaro (about 3000); all of which are seaports. The rival claims of Italy and the Jugo-Slavs constituted an important feature of the treaty discussions during the entire year and the question of Fiume threatened more than once to cause serious difficulties between Italy and the Allies and was not settled at the close of the year. For a discussion of the subject, see article WAR OF THE NATIONS.

DAMS. Naturally with State and municipal expenditures restricted and new water power developments held in abeyance on account of post-war conditions, there was no great activity in the construction of dams or many important works reaching completion. With the shortage of coal in many countries it was inevitable that hydro-electric development must take place to an extent never before realized and that water supply and irrigation projects as well as flood protection schemes will require dam construction on a large scale. The more notable works of the year, construction on which was really started,

were the Hetch Hetchy project in California and the Gilboa Dam of the extended Catskill water supply system of New York City.

HETCH-HETCHY DAM. The contract for the construction of the Hetch-Hetchy Dam which will form a reservoir from which San Francisco will be supplied was awarded on July 31st. A bid for a siphon spillway amounting to \$5,447,792.50 secured the contract and it was provided that the work should be completed in three years. Work was straightway begun and at the end of the year it was announced that the foundation had been unwatered by means of a log crib dam 40 feet high, 300 feet upstream from the main dam. This served to turn the water of the river into the diversion tunnel, which was 23 x 25 feet in section and 900 feet long. A dam 25 feet high just above the tunnel outlet prevented the water from backing up into the unwatered site. A steel caisson 120 feet long in three sections was arranged to be sunk immediately above and adjacent to the foundation of the main dam on the upstream side, so that the bottom could be entirely unwatered. It was hoped to have this work done by June, 1920, when the foundation concrete would be poured and work begun on the structure proper.

The site of the Hetch-Hetchy dam was located on the Tuolumne River about 150 miles east of San Francisco, and some 3600 ft. higher. The plans adopted called for one of the large masonry dams of the world. From the crest of the dam to the lowest estimate excavation is 311 ft., with a height above stream level of 212 ft., and an average excavation of 72 ft. with provision, however, for future enlargement. It was to be a straight cyclopean masonry gravity-section dam 600 ft. long, with a siphon spillway. The figures given in the advertisement for bids indicated the quantities of excavation and construction involved as follows: Excavation below stream level, 77,000 cu. yd.; excavation above stream level, 60,500 cu. yd.; cyclopean masonry, 298,800 cu. yd.; other concrete, 66,850 cu. yd.

GILBOA DAM. The Gilboa dam for the Schoharie development of the Catskill Aqueduct system was designed of two distinct types, with an overfall or masonry section 1300 feet in length, with steps on the down stream side leading to a spillway channel along the toe of the dam. The earth portion of the dam was designed with a masonry core, and heavy rock paving on the up stream slope, with a length of about 1000 feet. At the transition section the dam was to be flagged both up stream and down stream by a heavy masonry retaining wall to intercept the long slope of the earth section. At intervals of 80 feet from the foundation upward, dovetailed contraction joints would be inserted with a continuous vertical copper strip water-stop extending across the dam. The dam had the maximum height of 160 feet. See **AQUEDUCTS**.

WILSON DAM AT MUSCLE SHOALS. Further progress was made during the year on the so-called Wilson dam under construction by the United States government at Muscle Shoals on the Tennessee River at Florence, Ala. This dam was located near Nitrate Plant, No. 2, a War Department development during the war, to which it will supply, and in connection with a dam above and one below on the river will form an essential element in an important navigation project. The designs for the dam call for a

structure about 96 ft. high from bedrock to pool level and over 4000 ft. long. Containing nearly 1,000,000 cu. yd. of masonry the new dam will be among the largest in volume ever built. The full power development at the south end of the dam called for enough turbines to generate 300,000 to 375,000 horse power but at the beginning only four 30,000 horse power turbines were to be installed. The bulk of the power so generated was to be supplied to the nitrate plant. Navigation is provided for at the north end of the dam by a flight of locks, each 60 ft. wide, with 300 ft. available length.

During 1919 the work was in its preparatory stage and some 10 miles of railroad had been built to facilitate the construction. In August the first of six cofferdams was unwatered and during the autumn the rock was largely removed from the excavation for the cutoff wall along the heel of the dam. A construction bridge, with concrete piers, and track level rising above ordinary flood heights, was being built upon the apron of the dam. At the end about two-thirds of the total volume of 10,000 cu. yd. of concrete in the piers had been placed. This bridge was to carry four standard gauge tracks and will handle all supplies and material going to the dam. On a fifth and wider track were to be mounted seven 10-ton traveling tower derricks, with 90-ft. booms, which would lift the concrete in skips from the cars and place it in the dam. With these derricks at work by the spring of 1920, it would be possible to place 2000 yd. of concrete per day.

The aggregate for the concrete was to be secured from the river itself and a dredging fleet was assembled at Buck Island, nine miles below Florence. Two suction dredges will work at a bar of excellent sand and gravel, which will be screened and washed, and then towed upstream in barges for transfer to railway cars in which it will be delivered by rail to the three mixing plants. The largest plant, located on Jackson's Island in mid-stream, was equipped with two 4-yd. mixers, the other two each had two 2-yd. mixers.

At the end of 1919 work on the south side of the river at the power-house site was just beginning. A railroad connecting the nitrate plant with the abutment was nearly completed. Three additional traveling tower derricks were to handle the concrete for this section of the dam.

MIAMI FLOOD CONTROL DAMS. In the construction of the five retarding basin dams of the Miami Valley Flood Control Works, a large amount of the construction of 9,000,000 cubic yards of embankment is hydraulic fill, so that the use of this method was on an extraordinarily large scale. During 1919 pumping was in progress for the dams at Taylorsville and at Englewood, the one consisting of about 1,200,000 cubic yards, and the other 3,500,000 cubic yards. Two general methods were being used in the work; one is to break down, sluice, distribute and deposit the earth wholly by water, while the other is to excavate and transport the filling material mechanically and then to use the water to distribute and deposit it. This is the method to be followed at all the dams except Taylorsville and Lockington, and is the usual method of the flood control work. See **FLOOD PROTECTION**.

FRENCH DAM CONSTRUCTION. There was under discussion during the year in France a

scheme to increase the water supply of Paris by drawing upon the tributaries in the upper valley of the Loire. It was proposed to construct vast reservoirs between Nevers and Gien and at Villarest build a dam 60 meters (197 feet) high and capable of storing 175,000,000 cubic meters (46,230,000,000 gallons) which would give Paris a daily supply of 1,200,000 cubic meters (317,000,000 gallons). This project was meeting with opposition in the Loire district but seemed the most feasible plan to augment the insufficient water supply of Paris.

MURRAY RIVER DAM. In connection with a vast irrigation project near Albury, N. S. W., a large dam was to be built on the Murray River forming a reservoir which would extend into Victoria. The main dam was designed to be 3601 ft. long, divided into a 2700-ft. earth section, a 740-ft. concrete spillway and a 1061-ft. outlet works. It is only about 85 ft. at the deepest part of the river. The discharge over the dam will amount to about 100,000 cu. ft. per sec., and a portion of this was to be utilized for hydro-electric development. Other parts of the irrigation project comprise an irrigation canal, control of the Murray River by locks and dams, and future control of other nearby rivers.

There will be a total reservoir capacity of 1,000,000 acre-feet and a reservoir area of 30,300 acres, which brings it up among the large irrigation projects of the world. About \$8,000,000 was to be expended by the governments of New South Wales, South Australia, Victoria and the Commonwealth of Australia.

DANISH LITERATURE. See SCANDINAVIAN LITERATURE.

DANZIG. An important commercial city formerly belonging to Germany, but constituted a free city by the terms of the Treaty of Versailles in 1919. Its population according to the German census of 1910 was 170,337. The shipping in 1918 comprised 1237 vessels with a total of 455,127, a falling off of more than one-half since 1913. About 57 per cent of the tonnage was German, the remainder being chiefly Norwegian, British, Swedish, and Danish. The provisions in regard to Danzig will be found in section 11 of the Treaty. By this the principal allied and associated Powers undertook to establish the city of Danzig and a certain defined surrounding area as a free city to be placed under the protection of the League of Nations. The Allied Powers engaged to arrange a Treaty between the Polish government and the free city with a view to including the latter within the Polish customs frontier and to insuring to Poland the free use and service of waterways, docks, etc., of the control and administration of the Vistula and the railway system, and of the right to improve waterways, docks, etc. See WAR OF THE NATIONS.

DARTMOUTH COLLEGE. A non-sectarian institution of higher learning, founded at Hanover, N. H., in 1769. In the fall of 1919 there were 1673 undergraduates and 65 graduates enrolled. The faculty contained 121 teachers and 33 administrative officers. Productive funds amounted to \$4,500,000, and the total income was \$450,000. The library contains 150,000 volumes. During the year a new swimming pool and a new dormitory were constructed. President, Ernest Martin Hopkins, Litt.D., LL.D.

DAVIDSON, SIR JAMES MACKENZIE. British surgeon and authority on radiology, died in

London, April 7. He was born Dec. 6, 1856; educated at Buenos Aires and in London, graduated at Aberdeen in 1882, and became a lecturer on ophthalmology there, practicing surgery at the same time. He went to London in 1897 and devoted his time to X-ray treatment in which he did valuable work and gained a wide reputation. He invented a method of localization for foreign bodies in the eye and for bullets, etc. At the time of his death he was consulting surgeon to the Röntgen Ray Department, Charing Cross Hospital. His publications include the following: *The Electric Light Applied to the Ophthalmoscope*, (Lancet, 1886); *Röntgen Rays and Localization*, (British Medical Journal, 1898); *Stereoscopic Skiagraphy*, (British Medical Journal, 1898); *Localization of Foreign Bodies in Eyeball and Orbit*, (Trans. IX. International Ophth. Congress, Utrecht), and various articles in the Trans. of the Ophthalmological Society of the United Kingdom; *Notes of Cases Treated by Radium Bromide Rays*, (British Medical Journal, 1904).

DAVIS, WALTER GOULD. American meteorologist, died at Danville, Vt., April 3. He was born at Danville, Vt., in 1851, and early devoted himself to scientific work in civil engineering. He succeeded Dr. B. A. Gould in charge of the Astronomical Observatory at Cordoba where the Argentine Meteorological Service was installed (1885). He was afterwards of the National Weather Bureau at Buenos Aires. He brought the service into the front rank of meteorological departments. During his administration more than 2000 stations were established. He was an active and progressive erector. Not only did he cover the mainland but he extended the service into the Antarctic province to the south. He enjoyed a high reputation among meteorologists everywhere.

DAVIS, WILLIAM JAMES. Theatrical manager, died at Chicago, May 10. He was born in Washtenaw County, Mich., Feb. 8, 1844; served in the United States navy during the Civil War and was in business in government employ until 1873. He afterwards became manager of theatrical companies in Chicago and as member of the Hainen and Davis Company and owned the new Illinois theatre; was one of the owners and managers of the Iroquois theatre destroyed in a fire that caused a great loss of life and was prosecuted on account of it, but acquitted after a long trial. He retired from business in 1914.

DAYLIGHT SAVING. In 1919 the Daylight Saving time scheme became effective at 2 A. M. on Sunday, Mar. 30, 1919, in accordance with a report submitted to the Director General of Railroads by the Committee on Transportation of the American Railway Association. This report was in connection with the Federal Statute "To Save Daylight and to Provide Standard Time for the United States," which became effective at 2 A. M. Sunday, Mar. 31, 1918. In General Order No. 61, issued by the Director General of Railroads Mar. 15, 1919, the following provisions in regard to the execution of this statute figured:

First, (a) At 2 A. M. Sunday, Mar. 30, 1919, and on the last Sunday in March of each year thereafter, all clocks and watches in train dispatchers' offices, and in all other offices open at that time, must be advanced one hour, to indicate 3 A. M.

(b) At 2 A. M. of the last Sunday in October of each year all clocks and watches in train dispatchers' offices, and in all other offices open at that time, must be turned back one hour, to indicate 1 A. M., and regular trains must be held to conform to schedules after change in time.

Further provision was made for the comparison of watches with the train dispatcher's and conforming to the changed standards of time all offices.

REPEAL OF DAYLIGHT SAVING LAW. During the year 1919, an active movement was in progress to repeal the Daylight Saving Law, which had been passed by Congress and approved Mar. 19, 1918. This measure was sponsored in large part by the farmers, who complained that it increased the length of days and was not feasible in the ordinary conduct and economy of the farm. The claim was made that the transportation from rural districts to the city was in advance of natural milking time, and that the dew was on the vegetation an hour longer during the working day. Those dwelling in cities and the laboring interests were generally in favor of the bill, which afforded opportunity for recreation and also saved on artificial illumination. It was claimed that the repeal of the bill was also advocated by public utilities corporations engaged in the sale of gas and electricity for lighting. Accordingly House of Representatives Bill 3854, entitled "An Act for the Repeal of the Daylight Saving Law" was duly passed by both houses and presented to the President, by whom it was returned with a veto, in which he discussed the comparative advantages and disadvantages of the measure. He stated that "the immediate and pressing need of the country is production, increased and increasing production, in all lines of industry. The disorganization and dislocation caused by the war have told nowhere so heavily as at the industrial centres. It is to these the Daylight Saving Law is of most service. It ministers to economy and to efficiency, and the interests of the farmer are not in all respects separated from these interests. He needs what the factories produce, along with the rest of the world. He has profited by the prosperity which their success brings about. His own life and methods are more easily adjusted, I venture to think, than those of the manufacturer and merchant." The bill, however, was passed in the House of Representatives over the President's veto on August 19th by a vote of 223 to 101, and the Senate by a vote of 57 to 19 concurred in the action of the House.

NEW YORK CITY RETAINS DAYLIGHT SAVING. In the City of New York an ordinance providing for the local use of daylight saving independent of the repeal of the National Act, was passed unanimously by the Board of Aldermen and approved by the Mayor on October 24th. This ordinance provided that the clocks were to be set ahead the last Sunday in March, 1920, and restored on the last Sunday in October, as was done under the Federal plan, repealed in 1919.

At the end of the year the advantages of daylight saving were under discussion in 16 different States, and it was believed that proper legislation would be enacted to set forward the clocks in 1920, as was done under the former Federal statute which was repealed. See AGRICULTURAL LEGISLATION.

Y.B—10—7

DEAKIN, ALFRED. Former premier of Australia, died at Sydney, New South Wales, October 7. He was born at Melbourne, Aug. 3, 1856, and educated in the schools and the university of that city. He was elected to Parliament in 1879 and was made Minister of Public Works and Water Supply in 1883. He was a member of the Federal Council from 1889 to 1899, and he was the first Attorney-General of the Commonwealth, 1901-03. Afterwards he was Prime Minister for three year terms, the last being 1909-10. He was president of the commission to the San Francisco expedition in 1915. He wrote a number of books on irrigation.

DEANE, SIR HENRY BARGRAVE. British jurist, died in London, England, April 21. At the time of his death he was a member in the High Court of Justice. He was born, Apr. 28, 1846; and educated at Winchester and Oxford, winning the prize in 1870 for the Oxford International Law Essay. After continuous work in his profession he entered the Probate Divorce and Admiralty division of the High Court. He was raised to the bench on Feb. 1, 1905. He rendered decisions in many important cases and was celebrated among the judges of his time for his great knowledge of practice and his keen sense of humanity. In the matter of divorce he favored the complete equality of the sexes and he believed that the reports of divorce suits should be confined to a statement naming the wrong-doer and the person obtaining release without going into details.

DEATH RATE. See VITAL STATISTICS.

DE BOOY, CAPTAIN THEODORE. Explorer and archaeologist, died at Yonkers, N. Y., February 18. He was born in Holland in 1883, came to the United States in 1906 and was in charge of the West Indian archaeological work of the Museum of the American Indian in New York.

DEFICIENCY DISEASES. The increased cost of food which began during the war involves the possibility of defective nourishment in all small income people throughout the world. It is not alone the reduction in quantity but in the possibility that essential ingredients of food shall be missing from the dietary, that makes the question one of such gravity. Before the war the problem of deficiency diseases was serious enough and at least three well known maladies were being investigated by the food sanitarians of the world from this angle, to wit, scurvy, beri beri and pellagra. The first named no longer appears in its mediæval aspect, but occurs in scattered incidence and more or less masked. It was practically expelled from Europe when potato culture was introduced into that continent and was similarly stamped out of the British navy by the lime juice ration. It does not exist with a diet comprising fresh vegetables and fruits. Nevertheless, to assume that it no longer exists is an error, for according to the statistics of the United States Marine Hospitals there were over 800 cases treated in these institutions between 1873-1899. Infantile scurvy or Barlow's disease is not rare and is attributed to artificial feeding and the pasteurization of milk. That scurvy did not develop in a wholesale manner during and after the great war seems due to the fact that fresh vegetables were usually obtainable, and in fact were often the major portion of the diet. Had the public as in past centuries been compelled to subsist principally on a diet of cured fish

and flesh the outcome would surely have been different. Beriberi occurs as a menace only where the inhabitants who normally subsist principally on rice have changed from the whole to the decorticated or polished grains. In similar manner the extensive use of other decorticated cereals—wheat—has long been held responsible for defective nutrition, but this is largely a bugbear exploited for personal ends by commercialists, the fallacy being the disregard of the fact that those who subsist on finely milled flour get plenty of nourishment of other kinds which gives a balanced diet. This leads us to the vitamine theory of deficiency diseases, which gives a very simple explanation of these affections. This theory, which has largely displaced an older one based on deficiency of mineral matter as a cause of disease (the latter, however, still having its own province), takes cognizance of certain more or less hypothetical organic substances which are necessary, although only in minute quantities for the proper performance of the body functions and nutrition. Vitamines occur in a great number of food articles, but their destruction by heat and food preparation cuts down the available list to a great extent. Since vitamines occur in fresh fruits and fresh milk, we can understand the genesis of scurvy when these articles are excluded from the diet and the quick recovery from and prevention of scurvy when the patient is fed with them. We can also understand why pasteurization by destroying the vitamines of milk may be injurious to certain infants. Further it is clear why fowls who live on polished rice may develop a deficiency disease because they eat the grains raw. On the other hand the Japanese who eats cooked polished rice and contracts beri beri is as much a puzzle as the mediæval European who got rid of scurvy by eating cooked potatoes. The only way to make these views harmonize is to assume that the vitamines vary greatly among themselves and that while some are heat-unstable others are heat-stable within certain limits. The disease beri beri occurs in the form of an inflammation of the nerves and resulting paralyses and is not easy of comprehension as a result of unbalanced eating. In Spain both men and animals who live on chick peas develop a somewhat similar condition known as lathyrism but this passes out and out as a food intoxication.

The third of the three alleged deficiency diseases and by far the most important is pellagra, for while the other two are within control this affection is growing in extent and is invading strata of society which were once believed immune. Believed for many decades to result principally from a predominant diet of maize and spoiled maize at that, it has now become apparent that this peculiar malady which attacks the skin, gastro-intestinal tract and nervous system—incidentally causing much insanity—is far more complex and subtle than has hitherto been believed. Only recently it has invaded communities where it had never before been encountered and has attacked people in comfortable circumstances who certainly enjoy a sufficiency of food. From the peculiar symptoms of this affection it is easily overlooked and confused with other maladies. The skin alterations resemble those due to ordinary exposure, the affections of the mucous membranes have nothing to distinguish them from ordinary stomach

and bowel troubles and the nervous symptoms and insanity are also devoid of individuality. Masked pellagra has found its way to insane asylums in Northern States long before the disease was recognized as endemic in the South, this fact being apparent from a study of old case reports of insanity. It is hardly likely that pellagra can be traced to lack of vitamines in the diet or that it will be curable wholesale by diet alone.

Of minor deficiency diseases there have been several described, as a form of dropsy without heart or kidney disease seen throughout the warring countries, night blindness and others less well known. As yet it is far too soon to attempt an account of deficiency disease during and after the war. This will be a task for the future.

DELAWARE. POPULATION. The population of the State in 1910 was 202,322, and on July 1, 1919, it was estimated to be 218,722.

AGRICULTURE. The following table is compiled from a report of the Federal Department of Agriculture

<i>Crop</i>	<i>Year</i>	<i>Acreage</i>	<i>Prod Bu</i>	<i>Value</i>
Corn	1919	230,000	6,900,000	\$10,005,000
	1918	230,000	7,130,000	9,697,000
Wheat	1919	145,000	1,740,000	3,706,000
	1918	133,000	1,729,000	3,838,000
Potatoes	1919	11,000	913,000	1,141,000
	1918	12,000	1,044,000	1,462,000
Sweet potatoes	1919	7,000	966,000	1,063,000
	1918	6,000	720,000	900,000
Hay	1919	82,000	a 105,000	2,730,000
	1918	75,000	a 94,000	2,632,000

a Tons.

FINANCE. The balance on hand at the close of the fiscal year 1918 was \$571,195; that at the beginning of the year was \$280,221. The cash receipts for the General Fund for the year were \$1,428,848, and the expenditures, \$1,311,404. The outstanding indebtedness of the State on Jan. 13, 1919, was \$1,581,785.

CHARITIES AND CORRECTION. The following is a list of the public institutions of the State: Educational, Delaware College, Newark; Hospitals, State Hospital for the Insane, Farnhurst; Delaware Hospital, Wilmington; Homeopathic Hospital, Wilmington; Physicians and Surgeons Hospital, Wilmington; The Hope Farm Sanitarium, Marshallton; Almshouses, at Farnhurst, Wyoming, and Georgetown; Penal, State Penitentiary, Wilmington; Ferris Industrial School, Marshallton; Industrial School for Girls, Wilmington.

EDUCATION. The expenses for education in the State in the school year ending June 30, 1919 were \$1,129,010. The total enrollment in the schools was 37,440, and the average enrollment was 30,024, while the average attendance was 28,216. There were 1119 teachers employed with an average salary of \$662.10 per year. On Apr. 14, 1919, the Governor approved an elaborate School Code for the State, covering the State, county and district administrative machinery and personnel and powers, and such matters as teachers' certificates, salaries (\$400 being stated as the minimum), school attendance, and State support of schools. This code is the result of the study and the report of a school survey commission appointed as the result of an Act of 1917.

OFFICERS. Governor, John G. Townsend; Lieut.

tenant-Governor, Lewis Eliason; Secretary of State, Everett C. Johnson; Attorney-General, David J. Reonhardt; Commissioner of Insurance and Banking, Thomas R. Wilson; Treasurer, William J. Swain; Auditor, W. G. Roe; Commissioner of Education, Arthur R. Spaid.

JUDICIARY. Chancellor, Charles M. Curtis; Chief Justice, James Pennewill; Associate Justices, Thomas B. Heisel, Herbert L. Rice, William H. Boyce, Henry C. Conrad. See CHILD LABOR.

DENMARK. A Scandinavian kingdom of northern Europe, which consists of the peninsula of Jutland, the islands of Fünen, Lolland, etc., nearby, and the outlying island of Bornholm in the Baltic. It lies between 54° 34' and 57° 44' N. latitude, and between 8° 5' and 12° 40' E. longitude. These boundaries have existed since the war of 1864 with Germany, which country acquired at that time the duchies of Schleswig-Holstein and Lauenberg. For the question of the determination of Schleswig, see WAR OF THE NATIONS.

AREA AND POPULATION. The total area is 15,582 square miles, and the total population in 1916 was 2,940,979. The capital, Copenhagen, had a population in 1916 of 506,390, without suburbs; with suburbs, 605,772. The population is almost entirely Scandinavian. In fact, in 1911, among the inhabitants of Denmark proper, 96.66 per cent were born in Denmark, 0.07 per cent in the colonies, 0.15 per cent in Norway, 1.45 per cent in Sweden, 0.97 per cent in Schleswig, 0.47 per cent in other parts of Germany, and 0.23 per cent in other foreign countries. This makes the foreign-born population (in 1911) only 3/27 per cent of the total.

EDUCATION, ETC. Between the ages of seven and 14 elementary education is free and compulsory. The schools are maintained by communal taxes. In 1917 there were 3465 public schools (67 in Copenhagen, 158 in other towns), and 3243 in rural districts throughout the country. The total number of pupils in 1917 was 404,000. Besides the elementary schools there are 13 government grammar schools. These 13 government schools and 142 private schools together with other private schools, had, in 1917, an attendance of 58,000 pupils. In 1479 was founded the University of Copenhagen, which has five faculties, 100 professors and teachers, and about 2900 students. Women are admitted to the faculties on equal terms with men. Lutheranism is the established religion, but there is full religious toleration. The church is under seven bishops, who have no political functions, of whom the Bishop of Roeskilde is the metropolitan.

PRODUCTION. The chief products are wheat, oats, rye, barley, potatoes and other roots, cattle and other live-stock, and dairy products. The 1918 root-crop is shown below, in comparison with that of 1917, and with the 1909-13 average. The figures are in metric tons, as follows:

Article	1918	1917	1909-13, average
Potatoes	1,105,100	867,700	840,000
Carrots	129,600	103,900	228,800
Beets	5,266,700	4,218,900	4,414,600
Kohlrabi	4,558,900	5,482,500	4,554,600
Turnips	2,334,600	2,750,600	2,738,500
Sugar beets	944,400	882,700	788,500

The acreage and production of the chief crops are as follows for the years 1917 and 18:

Crops	Area		Production	
	1917 Acres	1918 Acres	1917 Cwts	1918 Cwts
Wheat	132,692	142,052	1,169,309	1,723,000
Rye	441,307	549,165	2,253,166	3,233,000
Barley	599,165	556,995	3,893,187	4,674,000
Oats	992,512	947,595	5,465,384	6,034,000
Mixed grain. 488,447		483,877	2,751,676	3,249,000
Potatoes	144,633	186,892	8,677,275	5,525,000

Live-stock reported in Denmark proper on July 15, 1918 numbered 545,000 horses (525,785 on May 15, 1915); 2,123,722 head of cattle (2,417,125 on May 15, 1915); 470,051 sheep (533,137 on May 15, 1915); 620,880 swine (1,918,975 on May 15, 1915); and 9,884,000 hens.

The fisheries are an important part of Danish activity. They are, for the most part, on the west coast of Jutland, Esbjerg being the centre of the industry. It was estimated that the total catch for the year 1918 was 5845½ tons, valued at 4,091,825 crowns (\$1,096,609). Of this quantity about one-third was torsk (cod) and two-thirds haddock and plaice. Most of the torsk was salted and most of the haddock went to Germany. There is practically no fishing activity during the months of January and February.

The labor situation in Denmark has improved with the increased cost of living. Practically all branches of labor had attained improvements in their social conditions at the beginning of 1919. The vast majority of the laborers in Denmark have heretofore worked about 58 hours weekly, whereas a new agreement on the part of employers reduced that time to 50½ hours weekly. This called for a reduction in working hours of from one half to one hour daily. Besides having obtained full compensation for the reduction in their working hours, the laborers have attained a general increase in wages amounting to considerably over 100 per cent. The greater part of this increase had formerly been accorded to the laborers in the shape of temporary allowances owing to the increased cost of living, but by the new agreement these allowances have been included in the regular wages, with the exception of certain extraordinary allowances accorded in August, 1918. For example, the general wages of mechanics are from £6 to £7 per week, as compared with £3 before the war.

The agreements which have been concluded embrace among others 30,000 farm laborers, 28,000 laborers from the iron industries, 8000 to 9000 from the textile industry, 6000 carpenters, 5000 painters, 4500 laborers from the shoe industry, 4000 masons, 4000 laborers from the slaughterhouses, 3000 tailors, 2500 laborers from the brickyards, 2500 from the wood industries, besides a number from minor industries.

With regard to the ever-increasing problem of housing, the *London Economist*, issue of Dec. 6, 1919, reported that the scarcity of housing accommodation was becoming more and more pronounced, and that the corporation of Copenhagen had then found themselves under the necessity of finding homes for more than 10,000 homeless people. Also, the necessity of arresting the rise in prices was becoming more and more evident. Among the remedies suggested was a higher bank rate, 12, 14, and even 16 per

cent having been suggested, which was regarded by many as the most effective remedy. Prices for the common necessities of life for the average family have doubled in amount since 1914.

The first two months of 1919 witnessed the greatest number of unemployed in most of the towns of Denmark. In the town of Odense, in particular, which has a population of 47,000, there were 4000 unemployed. This figure, however, has by now decreased to below 3000, for the cloth mills are again operating since the receipt of wool supplies from England and America. The lumber and building industries are unusually well employed.

COMMERCE. The following table gives the principal imports and exports of Denmark for the year 1918.

Article	Imports	Exports
Meats:		
Bacon and pork kilos	.	2,771,400
Beef, fresh do.	.	9,678,400
Casings, stomachs, etc. do	185,900	1,973,900
Live animals.		
Horses head	3,051	29,201
Cattle do	26	113,840
Butter kilos.	.	14,572,300
Milk and cream do	.	5,399,000
Eggs dozen	.	272,687
Fish, all kinds kilos.	5,428,700	19,442,600
Wheat do.	.	534,600
Rye do.	1,052,400	5,744,300
Barley do.	266,700	7,773,900
Maize do.	2,663,200	5,100
Flour (wheat) do.	5,586,000	264,300
Flour (rye) do	.	5,271,500
Grass seed do.	2,405,000	.
Beet seed do.	852,200	.
Oil cakes do.	360,600	.
Potatoes do.	700	46,347,600
All other vegetables and fruits do	6,288,900	13,088,800
Rice, rice meal, rice starch, etc do	4,071,500	.
Coffee do.	2,791,800	36,300
Tea do.	290,000	.
Cocoa do.	1,072,400	.
Sugar do.	294,500	5,772,400
Tobacco:		
Raw do	1,642,300	.
Cigars, cigarettes and smoking do	69,800	.
Spirits (whisky and cognac) liters.	272,600	.
Wool kilos.	65,400	80,500
Cotton do.	45,000	.
Hemp do	100,900	.
Yarn and thread:		
Silk do.	8,500	.
Wool do	47,100	.
Cotton do	534,700	.
Rope and twine do.	150,900	.
Silk goods do	743,000	.
Woolen goods do.	667,400	.
Cotton goods do.	1,243,900	.
Linoleum do.	498,700	.
Hides and skins do.	96,400	3,316,800
Leather do.	162,400	.
Boots and shoes do.	24,400	.
Tallow do.	1,300	210,400
Stearin do.	340,800	.
Fish oil (cod-liver oil, etc.) do.	1,748,900	.
Petroleum do.	11,078,200	1,500
Gasoline do.	855,300	.
Other fuel and mineral oils do.	5,773,400	.
Turpentine do.	124,000	.
Tar do.	3,133,100	.
Rosin do.	329,800	.
Timber and lumber, cu. meters.	986,204	.
Wood for fuel do.	125,689	.
Barrel staves kilos.	513,000	.
Wood pulp do.	60,297,700	.
Matches do.	782,600	.
Flowers and bulbs do.	1,588,900	.
Barks do.	296,500	.
Cork do.	744,400	.
Paper, and mfrs. of do.	23,366,700	.
Paint and colors do.	2,258,200	.
Calcium carbide do.	4,581,800	.
Caustic potash do.	482,500	.
Caustic soda do.	716,800	.

Article	Imports	Exports
Calcium soda kilos.	3,201,700	.
Kennet extract do.	.	506,000
Coal tons	1,751,240	.
Coke do.	292,623	.
Briquettes do.	117,561	.
Firebricks kilos.	7,320,600	.
Building bricks do.	9,932,000	.
Tile do.	1,557,000	.
Pipes and tubes do	9,286,800	.
Crockery and sanitary equipment do.	1,283,900	.

Plate glass do.	4,186,300	.
Glassware do.	5,020,800	.
Iron and steel.		
Pig iron do.	29,134,200	.
Scrap iron do.	.	28,250,400
Iron beams do.	62,827,400	.
Hoop iron do.	7,718,900	.
Iron plates do.	24,196,000	.
Galvanized plates do.	202,800	.
Iron and steel, n. e. s . . . do.	34,385,300	.
Agricultural implements . . do.	4,487,200	.
Screws, nuts and bolts . . . do.	1,641,700	.
Sewing machines do.	280,600	.
Nails do.	1,265,100	.
Copper and brass, raw . . . do.	488,000	.
Zinc, raw do.	1,552,800	.
Lead do.	190,000	.
Metal waste do.	.	1,137,100
Manufactures of copper . . . do.	383,600	.
Zinc plates do.	735,000	.
Lead plates do.	490,700	.
Bicycles do.	166,700	.
Automobiles, complete number	241	.

During January, 1919, there was an increased importation from England and the United States, considerable quantities coming under Danish-American agreements, besides some shipments not under that agreement. The importation of coal, salt, and other raw materials from Germany was resumed, and an increasing amount of coal arrived from England.

COMMUNICATIONS. Denmark proper, not including Copenhagen, had, at the end of 1917, 4197 miles of roads, besides 23,375 miles of byways. Railways of a total length of 2644 English miles covered the country, of which 1283 English miles belonged to the State. On Mar. 31, 1916, the total value of the State railways was 325,539,187 kroner. The Danish State railways having been for a considerable time in need of more freight cars, in November, 1918, ordered 750 from the "Scandia" factory in Randers, Denmark. This gave work to 500 people who had been unemployed. A set of wheels in 1918 cost \$348 while before they had only cost \$40. At the beginning of 1917, Denmark had 3570 vessels, with a total tonnage of 595,252. On Jan. 1, 1918, the gross tonnage of Danish vessels was 577,822 for steamships; 97,316 for motorships; 103,575 for sailing vessels. There are 1219 post offices which carried, in 1917-18 213,541 letters and 193,398,942 samples and printed matter. The length of the State telegraph lines on Mar. 31, 1918 was 2258 English miles, with 188 offices. On the same date the length of the State telephone wires, added to those of private companies, was 419,988 English miles.

One of the features of the increased railway traffic during the year was a pressing demand for railway bridges across the Little Belt, between the Island of Funen and Jutland, and across the Storstrom between the islands of Sjælland and Falster. Such bridges would form an important link in the Danish-German railway traffic, and the director-general of the Danish state railways during the year promised that measures for their construction would be

laid before the Danish Legislature if the plans are ready in time. To show the development of this trend of transportation some interesting figures in connection with the traffic across the two waters in question may be cited. The steam ferry traffic across the Little Belt in 1893 was 110,000 tons of freight; in 1913 this rose to 562,000 tons and in 1917 to 880,000 tons. The passenger traffic was 222,000 in 1893, 598,000 in 1913, and 713,000 in 1917, and the actual expense of the ferry traffic, exclusive of interest on cost of material and harbors, repairs, etc., rose from 144,000 krone (\$38,000) in 1893, to 393,000 krone (\$98,250) in 1913, and 873,000 krone (\$218,250) in 1917. An argument in favor of a bridge across the Little Belt was that it would greatly enhance the practical capacity of the rolling-stock stationed in the Island of Funen, and at the same time would save time, increase the comfort of passengers, and facilitate traffic.

FINANCE. The budget of 1918-19 showed a total revenue of 192,667,161 kroner, and a total expenditure of 130,015,759 kroner. Abstract of the budget for 1919-20 is given below:

Current revenue	Kroner	Current expenditures	Kroner
Balance of domain revenues	1,786,236	Civil list and appanages	1,222,000
Balance of State undertaking	13,541,241	Rigsdag	1,500,000
Interest on outstanding debt	7,519,506	Interest and expenses on State debt	26,769,453
Balance of lotteries	1,509,198	Council of State	185,875
Balance of funds, etc	639,517	Ministry of Foreign Affairs	1,250,243
Direct and indirect taxes	172,073,900	Ministry of Public Worship and Instruction	22,702,072
Separate revenues	2,262,196	Ministry of Justice	12,480,409
		Ministry of Interior	23,111,691
		Ministry of Agriculture	5,432,178
		Ministry of War	16,942,922
		Ministry of Marine	10,475,000
		Ministry of Finance	12,902,554
		Ministry of Public Works	2,228,364
		Ministry of Commerce and Navigation	2,676,102
		Pensions	5,188,900
		Iceland	279,000
Total revenue	199,331,794 (£11,073,988)	Total expenditure	145,346,763 (£8,074,820)

In the budget no provision is made for the extraordinary expenses incurred during the war. The expenses of the Ministry of War and the Ministry of Marine were, respectively:

1915-16, 68,636,113 kr. and 20,374,038 kr.; 1916-17, 85,228,919 kr. and 25,543,747 kr.; 1917-18, 86,120,751 kr. and 30,377,041 kr.

The public debt at the close of the financial year, 1918, was placed at 629,200,000 kroner, having increased by about 300,000,000 during the war; the assets of the State were placed at 1,113,200,000 kroner. The nature of the debt had changed to a very marked degree during the past few years. Whereas it had been mainly held outside the country, it was now placed mainly within, former foreign holders having been largely bought out by native investors.

Money is now fairly scarce. Only a few years ago Denmark's commercial balance was completely satisfactory, but now it is unfavorable. For September, 1919, the exports amounted to 86,000,000 kr., whereas the imports amounted to 171,000,000 kr. In June the position was still worse, the figures being 53,000,000 kr. and 273,000,000 kr. respectively. For the first three quarters of 1919 the exports amounted to a total of 542,000,000 kr., as against the formidable aggregate of 1,699,000,000 kr.

According to the *London Economist*, issue of Nov. 22, 1919, the Copenhagen Stock Exchange had shown a state of universal depression dur-

ing the last several months. Shares, without any exception except in degree, had receded very materially all around. The recent depression was attributed to a number of causes—the uncertainty generally of the political position, the exorbitant demands and constant unrest of labor, and the exceedingly high tax rates already in force, with the prospect of still higher to come. Dr. Edward Brandes, the Minister of Finance, admitted that the new taxes, including the tax on capital, would in some cases amount to 100 per cent of the income in question; in particularly flagrant cases it was even said that the tax would amount to 105 per cent of the income.

DEFENSE. The national militia constitutes the Danish army, in which all able-bodied subjects must serve, except the inhabitants of the Faroe Islands and Iceland. The military age is from 20 to 36. During the first eight years, the men are in the active army, and during the second eight years, in the extra or territorial reserve. Upon joining the army, recruits are trained for 165 days in the infantry, 280 days in the field

artillery, one year in the garrison artillery, and 200 days in the cavalry. According to the latest available figures, there were 15 regiments of infantry making up 53 battalions, 4 regiments of cavalry, 4 garrison artillery battalions, 3 battalions of engineers, and 2 regiments of field artillery, having a total of 20 four-gun batteries. The peace strength of the active army was placed at about 820 officers and 12,900 men. The fighting strength of the field army was placed at about 50,000 men. The latest figures for total war strength are from 1914, when it was placed at 1600 officers and 83,734 men.

The navy serves only for coast defense. It consists of 5 monitors, 2 small cruisers, 10 submarines, 16 torpedo boats, and other small craft.

GOVERNMENT. For administrative purposes, the country is divided into 18 counties, each under a governor. Iceland is a self-governing dependency, with its own constitution and administration. The legislative organ of Iceland is the Althing, consisting of 40 members, of whom 34 are elected by popular suffrage and six by proportional representation. The trade of Greenland, Denmark's other large colonial possession, is a State monopoly.

The reigning king in 1919 was Christian Charles Frederick Albert Alexander William, whose title is Christian X. He was born Sept. 26, 1870; married Apr. 26, 1898, to Princess

Alexandrine of Mecklenburg, who was born Dec. 24, 1879. He was proclaimed king on the death of his father, May 14, 1912. The heir-apparent is Prince Christian Frederick, born Mar. 11, 1899. There is a second son, Prince Knud, born July 27, 1900. The other relations of the king are as follows: His brother, Prince Karl, born Aug. 3, 1872; elected king of Norway under the title of Haakon VII, 1905, and married July 22, 1896, Princess Maud Alexandra of England, whose son the Crown Prince Olav, was born July 2, 1903; other brothers, Prince Harald, born Oct. 8, 1876, and Prince Gustav, born Mar. 4, 1887; sisters, Princess Ingeborg, born Aug. 2, 1878; Princess Thyra (Mar. 14, 1880); Princess Dagmar (May 23, 1890). King Christian's father, Frederick VIII, was a brother of Queen Alexandra, of King George I of Greece, and of the former Dowager Empress of Russia.

In 1919, the Danish cabinet ministers were as follows: President of the Council and Minister of Justice, Carl Theodor Zahle; Minister of Foreign Affairs, Erik Scavenius; Minister of the Interior, Ove Rode; Minister of Defense, Peter Munch; Minister of Finance, Edvard Brandes; Minister of Public Instruction, Søren Keiser-Nielsen; Minister of Ecclesiastical Affairs, Thorvald Povlsen; Minister of Agriculture, Kristjan Pedersen; Minister of Public Works, Jens Hassing Jørgensen; Minister of Commerce and Navigation, Christopher Hage; Ministers for Iceland, Jon Magnusson, Sigurdur P. Eggerz, and Sigurdur Jonsson; Minister without Portfolio, J. A. M. Stauning. The Zahle ministry having been attacked violently by the parties of the Left resigned on March 1st but it was impossible to frame a new ministry and after two weeks it resumed office. The Schleswig question agitated the public throughout the year. The proposed plebiscite was objectionable to the government if it should mean that aliens would be incorporated in Denmark.

DENNIS, JOHN. Journalist, died at Rochester, N. Y., December 31. He was one of the best known newspaper men in his part of the State, having been associated with *The Democrat and Chronicle* for 40 years. He was born at Waterloo, N. Y., in 1844. Early in his career as a journalist he was cited by a court at Rochester to reveal the source of information on which a certain article that he had written was based. He refused and was thereupon ordered to jail for contempt but under pressure of public disapproval was released the next day. His course aided in establishing the precedent that the newspaper reporters were not obliged to reveal the source of their information.

DE PAUW UNIVERSITY. A co-education institution, founded in 1837 at Greencastle, Ind., under the auspices of the Methodist Episcopal Church. In the summer session of 1919 there were 88 students; in the fall, there were 373 men and 480 woman students. The faculty numbers 53. Productive funds, \$2,115,796, and the income for the year, \$161,379. The library contains 48,000 volumes. President, George Richmond Grose, D.D., LL.D.

DES MOINES, IA. See MUNICIPAL OWNERSHIP.

DESTROYERS. See NAVAL PROGRESS.

DETROIT, UNIVERSITY OF. An institution of learning for men, under the auspices of the Roman Catholic Church. The enrollment in the fall of 1919 was 1450, and there were 69 mem-

bers in the faculty. The library contained 20,000 volumes. The university was founded at Detroit, Mich., in 1877. President, William T. Doran, S.J.

DETROIT. See WATER-WORKS.

DEUTSCH de la MEURTH, HENRY. French patron of aviation, died in Paris, November 24. He was among the first to advocate the form of motor now in use in aircraft. He was born in Paris in 1846 and with his brother succeeded to the direction of the important industrial establishments founded by his father. He wrote while still young a valuable treatise on *Le pétrole et ses applications*, and at the time of the Paris Exposition he predicted the success of the motor above mentioned. He founded the prize of 100,000 francs gained by Santos-Dumont in 1901, and five years later he presented to the war ministry a dirigible which succeeded in making the flight to Verdun. After the Reims meeting of 1909 he endowed the Aéro-technical Institute of Saint-Cyr, and soon afterwards founded a chair of aeronautics at the Conservatory of Arts and Crafts. He was president of the French Aéro Club and honorary president of the General Aéronautic Association.

DEVELE, JULES. French senator, died in Paris, Oct. 31. He had served in former cabinets as minister of foreign affairs and of agriculture. He was born at Bar-le-Due Apr. 12, 1845, studied in the Lycée of that town, then went to Paris where he took courses in the school of law and was admitted to the bar in 1866. In 1872 he entered the administrative service, and in 1887 was elected to the Chamber where he served until 1898. Failing in the following elections he was appointed councillor of state, and on Feb. 27, 1910, senator. He was several times cabinet minister, and it was he who chose for his secretary under the Goblet ministry the young lawyer afterwards president of the republic, M. Raymond Poincaré. He belonged to the party of the Republican Union.

DEVERY, WILLIAM S. Former chief of police of New York City, died at Rockaway, Long Island, June 20th. He was born in 1854. He was for a long time a well known and picturesque figure in the police history of November and figured largely in the newspapers down to some 15 years before his death. He was constantly accused of irregularities and of trying a corrupt system of Tammany politics but he always contrived to escape conviction. His friends were numerous and his influence was extensive. He was particularly known for his striking remarks on politics and other subjects and for his effective retorts upon his enemies. Many of his sayings expressed in the slang of the day were circulated in the press. He acquired considerable wealth and during the latter part of his life was not active in politics.

DIAMONDS. See MINERALOGY.

DICKSON, JOSEPH BENJAMIN. Chairman of the Anthracite Committee of the Fuel Administration, died in New York, December 13. He graduated at Lafayette College 1883 and for many years was prominent in the coal business in New York.

DIÈMER, LOUIS J. French pianist and teacher, died in Paris, December 22. He was born in Paris, February 14 in 1843 and carried off the first prize of the Conservatory when only 13 years old. He became professor of the piano at the Conservatory in 1887 and he gave

piano recitals which attracted extraordinary interest at the Paris Exposition in 1889 after which he devoted himself to the older piano music and founded the Society of Old Instruments. He wrote concert pieces for the piano and some excellent chamber music; also published a collection of *Clavichimistes français*.

DISASTERS. See **FIRE PROTECTION**, and **SAFETY AT SEA**.

DISCIPLES OF CHRIST. Reports show that this denomination is now the fifth largest Protestant denomination in the United States. The church has been rapidly gaining in the last few years to figures that have been very gratifying to its followers. In 1919 there were in this denomination about 1,400,000 communicants, 11,200 churches, with 8500 ministers. Exact figures are unobtainable. The administrative work is carried on by an annual conference, while many State conferences take care of local work. The Disciples of Christ lead as to influence and size over all other denominations in Kentucky, Indiana, and Missouri, while in Illinois, Iowa, Kansas, Nebraska, and Texas, their following is very large. Now that the war is over the denomination has been able to expand its missionary work. Formerly the dearth of men available for missionary work had seriously impaired this branch of expansion. The church maintains eight missionary boards and 26 colleges. Principal among these colleges are Butler College, Drake University, and Spokane University. *The Christian Century* is the principal periodical published by the denomination, but there are also 14 others. The officers of the General Conference in 1919 were as follows: President, Rev. Edgar DeWitt Jones; and secretary, Rev. Robert Graham Frank.

DISTRICT OF COLUMBIA. See **MINIMUM WAGE**.

DITTENHOEFER, ABRAM JESSE. Lawyer, died in New York City, February 23. He was born at Charleston, S. C., Mar. 17, 1836, and graduated at Columbia College. He was admitted to the bar in 1864 and was one of the electors that chose Lincoln. He was chairman of the German Republican Central Committee for 12 terms and was prominent in many important corporation and commercial cases. He appeared on behalf of parties accused during the sugar scandals and was especially known as an authority on the law relating to the stage and drama. He defended the Metropolitan Opera Company in the *Parsifal* Suit brought by Madame Wagner. He secured amendment to the United States copyright law for the protection of plays.

DMOWSKI, ROMAN. Polish representative at the Paris Peace Conference. He had been the unofficial representative of the Russian Poles in the early part of the war, and he afterwards helped to form the Polish National Committee of which he was appointed President. In politics he was known as a conservative and he had been a leader of the Russian Poles. He was a member of the first Duma and the author of a well-known work on the Polish question. As President of the Polish National Committee he obtained the recognition from the Allied governments of this institution.

DOBRUJA. The name of the southeastern

portion of Rumania, bounded by the Danube on the north and west, Bulgaria on the south, and the Black Sea on the east; status in 1919 pending under the Peace Treaty. Area, about 6000 square miles. Population in 1913, 380,430, including Bulgarians, Rumanians, Turks, Tartars, Greeks, Armenians, and Jews. Agriculture is the main occupation, as the soil is very fertile. The chief products are: cereals, tobacco, vines, beets, the mulberry, and fodder-yielding plants. The chief towns are Constantza, a seaport, and Tulcha, whose populations before the war were, respectively, 27,622 and 22,186. Prior to 1878 Dobruja belonged to Bulgaria, and was then transferred to Rumania. See **RUMANIA** and **WAR OF THE NATIONS**.

DOCKS AND HARBORS. The year 1919 saw considerable development in the provision of dry docks for the navy and merchant marine of the United States. Even before the war the necessity of docks of adequate length was apparent, and with the taking over for transport service of the former German liner *Vaterland*, renamed the *Leviathan*, it was apparent that no dry dock in the United States was large enough for that steamer. The Norfolk Navy Yard dry dock, 1011 feet long, 144 feet wide at the coping, and 40 feet deep, was opened in April, having cost \$4,500,000, and being sufficiently large to accommodate any ship that could pass through the Panama Canal. There was also under construction by the Commonwealth of Massachusetts a dry dock 1176 feet long and 149 feet wide at coping, located at the city of Boston. Under authority from Congress, the navy purchased this structure, completed it, and was able to provide accommodation for the largest naval and commercial ships.

During the year a large dock of the same size as the Norfolk dock was under construction at the Philadelphia navy yard, and plans had been prepared for a dock at the Charleston navy yard, on which construction was to proceed in earnest in 1920. This dock was important, as there was no dry dock south of Hatteras between Norfolk and Panama. In connection with this project the United States Congress directed the deepening of the channel at Charleston harbor, and at the same time appropriated \$4,000,000 to construct a dry dock practically the same as those at Norfolk, Boston and Philadelphia. At San Francisco the navy had made possible the construction by a private corporation of a big dock at Hunter's Point, San Francisco harbor, 1007 feet long, 153 feet wide and coping, 37½ feet deep. At Panama there was also a large drydock which was referred to in the **YEAR BOOK** for 1914.

PEARL HARBOR DRY DOCK. After being under construction for 10 years, the United States navy dry dock at Pearl Harbor, Hawaiian Islands, was completed and flooded on August 21st in the presence of the Secretary of the Navy. A small naval station had been located at this point, and Congress originally authorized construction of a graving dock 589 feet long, but the length was subsequently increased, in view of the greater size of ships and the development of the Panama Canal. Accordingly the dock was increased to be 1022 feet long, 138 feet wide at the coping, 39½ feet in effective depth, and work was started and was proceeding when a seismic upheaval occurred on Feb. 7, 1913, resulting in

the collapse of the structure. At this time, whether the project should be abandoned entirely in favor of a floating dock, or whether renewed efforts should be made to construct a graving dock, was thoroughly discussed, but a commission of civil engineers of the navy and from civil life, headed by Alfred Noble, developed a plan of construction which was duly approved, and which resulted in the structure being finished during the year. This dock was not only essential to naval operation in the Pacific, but was of the greatest advantage for the merchant and passenger ships in ever increasing numbers in the Pacific Ocean. This dock has been described in the YEAR BOOK for 1918.

Two dry docks in the Norfolk Navy Yard, adjacent to the machine shops built through the cooperation and financial assistance of the Shipping Board especially for merchant ships, were completed during the year, and on the 31st of October the Queen of the Belgians pressed the button flooding the docks and formally inaugurated them.

A shipbuilding dock novel in American practice was completed on Jan. 31, 1919, at Puget Sound Navy Yard, Washington. This floating dock was 836 feet long, 130 feet wide, and 18 feet deep, affording space for the construction of two destroyers at one time. After the building of the vessel is completed, the dock is flooded and the ship floods from the blocks instead of being launched. There are two 20-ton hammer-head cranes, one on each side. The entire project cost about \$600,000. This novel dry dock was dedicated on Dec. 16, 1919, and two new ammunition ships, U. S. S. *Pyro* and U. S. S. *Nitro*, built in the dock, were formally launched when water entered and floated them. Two target rafts were also launched at the same time.

NORFOLK NAVY YARD DRY DOCK. The 1000 foot navy yard dry dock at Portsmouth, Va., was completed and opened during the year 1919, all of the concrete being placed by Jan. 15 of that year. The excavation was started at the river end of the dry dock February, 1917, and six months later the first concrete was placed in one of the floor monoliths of the dock near the river end. The total excavation, which amounted to 625,000 yards, was completed early in 1918, and the concreting continued at the rate of 12,000 yards per month. The total concrete yardage was 185,000, and duplicate mixer units of large size worked continuously on the job. The cement was received in bulk in box cars at the dock, along which the sand and gravel lighters were unloaded, and from stock bins the materials were fed into mixers which discharged into 2 yard side gate cars, which were in turn carried on standard flat cars. In addition to the main dock on the down stream side, two 600 feet docks were built for the Shipping Board, and the same methods were used as for constructing the larger dock.

COMMONWEALTH DRY DOCK. The Commonwealth dry dock in South Boston, which had been under construction for three years by the State of Massachusetts, was formally taken over by the navy, and was put in commission on Dec. 22, 1919, in the presence of the Secretary of the Navy, and the battleship *Virginia* was the first vessel to use the new dock. This dock, as already mentioned, is 1176 feet long and 149 feet 9 inches wide. A ship of 1150 feet length, the beam of 115 feet, 45 feet draft could be ac-

commodated. The capacity of the dock is 55,000,000 gallons and the unwatering is accomplished by three electric pumps in about two hours. The cost to the State of Massachusetts was over \$3,000,000 and the dry dock was purchased by the U. S. government for \$4,100,000 on the understanding it should be turned over complete in all respects. The Navy Department planned to construct nearby two wet docks for fitting ships.

ATLANTIC HARBOR IMPROVEMENTS. The increased commerce due to the war at the various Atlantic ports caused a general consideration of greater channel depths and other improvements. At New York improvements in the East River made navigation through Hell Gate safer for vessels up to 22 feet draft, and a proposed project of the Engineer Department U. S. army was to open the channel to a main depth of 40 feet at this part of the river, and also remove Shell Reef in order to permit the better development of the Manhattan water front below Blackwell's Island. During the year 1918-19 the improvement of the Delaware River from Philadelphia to the sea had reached a point where ships drawing 34 feet were able to navigate the channel without difficulty, and further dredging and removal of rock from Philadelphia and harbor in the channel was proposed. The chief engineers reported that the improvement of the Delaware River had enabled the coastwise vessels to relieve greatly the congestion of the railway traffic and that the economic value of the improvement to commerce had been very great.

In general the same changes had been secured in the work done at Norfolk harbor, and deeper draft vessels and diminution in lighterage expenses had been secured, together with easier, safer and better navigation. The harbor improvement at Norfolk, together with the development of the rail facilities, had brought about lower freight rates between southern and eastern points. It was proposed as a further development to dredge an anchorage of about 64 acres, with depth of about 35 feet at mean low water, and to widen further the 40-foot channel.

Harbor improvement at Charleston, S. C., was also a work which had developed commerce, as this port in 1919 had deeper water than any other port on the Atlantic or Gulf south of Norfolk, and vessels drawing 32 feet of water could enter the harbor and dock on Cooper River.

NEW YORK HARBOR IMPROVEMENTS. The Commissioners of the Sinking Fund of the City of New York during 1919 authorized the construction of 14 new steamship piers on the east shore of Staten Island, located just inside the shore between Tompkinsville and Clifton. They were to be each 125 feet wide, and would vary in length from 1000 to 1124 feet and would be provided with one-story sheds, being of the New York standard type, that is, with sheds occupying practically all of the pier, so that freight handling was done from cargo masts. The total cost of the development was to be about \$15,000,000. Commissioner Hulbert, of the Department of Docks, during the year announced a Port Development plan which included the Staten Island development, the construction of the southerly five piers on the North River, reconstruction of the scattered piers throughout the city, construction of three piers in South Brooklyn and addition of one steamship pier to the present North River 48th Street group, intensive study of

the Jamaica Bay improvement, work for the straightening of the Harlem River, and study of the East River shores. With the exception of the Staten Island project no further authorization for this work had been made by the Sinking Fund Commission.

The Society of Terminal Engineers at New York during the year adopted resolutions asking the city officials to consider the redesigning of the proposed Staten Island piers so as to provide a more efficient system of freight than the cargo mass system which was the usual method at New York. The resolutions of this society referred to the method as "the same inefficient, expensive and slow manner as it has been handled in the Port of New York for the past 25 years," and further stated that inasmuch as these piers furnish direct connection between the docks and the transcontinental lines of the city, provision should be made for leading rails on the piers for direct interchange of freight between rail and ocean carriers, and that the installation of modern cargo handling devices and machinery be installed as necessary for securing for the Port of New York the advantage and prestige which its physical advantages should command.

DULUTH ORE-SHIPPING DOCK. The ore-shipping dock of the Duluth, Missabe & Northern on Duluth-Superior Harbor, was placed in operation on May 1, 1919, and was the largest ore shipping dock in the world, having a length of 2438 feet, or sufficient to dock two of the world's largest ships, the *Bismarck* and *Leviathan*, end for end on either side. The dock is 84 feet above water, with electric light masts reaching to 120 feet. It replaced an old wooden ore dock which was wrecked and new piling driven, construction being begun in 1916. A total of 971,014 linear feet of timber piling was driven by July 28, 1919, and at the same time 174,230 linear feet of 12-inch, 43-pound, United States Steel sheet piling in 38 foot lengths was also driven. The entire dock foundation was surrounded by sheet steel piling, and after suitable caps and tie rods were placed, the entire foundation was pumped full of sand, which was leveled off at low water datum and served as a support for the concrete foundation slab in which the piles projected 9 inches. This reinforced concrete slab forming the foundation was 2438 feet long, 69 feet wide, and 6 feet deep, with openings along the centre line which were filled with sand. The reinforcement consisted of a layer of 1-inch plain round steel rods on 6-inch centres crosswise the dock and a layer of $\frac{3}{4}$ -inch rods on 12-inch centres lengthwise the dock, placed near the bottom of the slab. A total of 884,410 pounds of reinforcing steel and 171,320 pounds of tie rods were used in this part of the work. Recesses were left in the concrete slab to allow the placing of column anchor bolts and the pouring of column footing pedestals as one block. The superstructure provides for 384 ore pockets, 12 feet centre to centre, with 6540 cubic feet capacity each. Eight standard 50 ton ore cars can be dumped into each pocket without trimming, thus providing a storage capacity of 3072 cars, or 153,600 tons. The top of the dock is 76 feet 5 inches wide, and carries 4 tracks the entire length. There are 7 lines of wharves, and the elevation of the rails and wharves was so arranged as to leave no troublesome flangeway openings to require constant cleaning. The superstructure has a structural steel frame with concrete partition walls, pocket walls and side-

walk slabs. The fronts are of plate steel supported between pocket walls by I-beam wales and held against the walls by tie bolts, while the entire pocket structure is carried by two lines of steel columns spaced 12 feet apart, each column designed to carry 1,500,000 pounds. The entire dock and approaches can carry the heaviest locomotives of the Duluth, Missabe & Northern, a 304-ton Mallet type, and a 266-ton Santa Fe type, with 55,000 pounds axle loads. The partition walls and the loads from the pockets are carried to the columns by two plate girders forming an A-frame, and the pocket bottom slab rests on transverse I-beams that frame into these girders. The ore chutes are of the usual type, but heavier, and are raised and lowered by electric motors. The dock is approached by a two-track steel trestle 3087 feet long, beyond which is also a 400-foot elevated embankment carried between parallel concrete retaining walls. This ore dock is described in *Railway Age*, Aug. 22, 1919.

THE HOUSTON, TEXAS, HARBOR DEVELOPMENT. The inland city of Houston, Texas, since 1914 was connected, by a ship canal or channel 50 miles in length, with the Gulf of Mexico. This canal extends northwest from the harbor entrance at Galveston across Galveston Bay, and utilizes the San Jacinto and Buffalo rivers to reach a turning basin 1100 feet in diameter, which is some seven miles from the city and is connected by a light draft canal with a wharf at Main Street in the center of the city. At the turning basin some 3730 feet of water frontage are provided by wharves, which include 4 for general freight, 1 for cotton, and 1 for barge service. The first freight wharf and the cotton wharf were completed in 1915, but the others were built during the period of the war, and some portions of the terminal improvement were used by the War Department as an aviation supply depot. Various types of construction were employed on the wharves, and there was considerable trackage and freight handling equipment. The expenditure on this harbor since the first improvement was authorized in 1872 until June 30, 1918, aggregated \$6,725,000, of which \$5,346,000 was for new work and the balance for maintenance. It was proposed for the United States to enlarge the channel at a cost of \$3,850,000, of which \$1,365,000 would be paid from a bond issue of \$1,500,000 authorized in May, 1919, by the Harris County Navigation District. This port development by 1919 had resulted in creating a large industrial centre, and several oil refineries and cotton stores, a Portland cement plant and a chemical plant were located along the channel. During 1918 about 2,388,000 tons of merchandise valued at \$16,332,000 passed through the channel, there being over 15,000 trips of steamers, barges and other vessels.

ST. LOUIS MUNICIPAL DOCKS. During the year 1919, the city of St. Louis was spending some \$300,000 on a municipal dock which had been under construction for several years. The dock wall was being extended to a total length of 900 feet, the construction of pile fenders upstream and downstream and the concrete wall making a total length of about one-half mile. A warehouse with 60,000 square feet of floor space and the necessary railway tracks and roadway connection with the terminal were under construction. The work was being performed by city forces, and the mechanical equipment was being

purchased by the City Supply Commissioner on city specifications.

WILMINGTON, DEL., PORT IMPROVEMENT. The City Council of Wilmington, Del., authorized during the year the issue of bonds to the amount of \$3,000,000 for the development of the harbor of that city. The first improvement was to be the construction of a \$400,000 produce wharf for the local market, and the remainder was to be devoted to general port improvement. The work was to be in charge of the Board of Harbor Commissioners of Wilmington, Del., who had previously received a report from John Meigs, Consulting Engineer of Philadelphia, in reference to an elaborate port development.

COAL HANDLING TERMINAL AT NEW YORK. During the year the Central Railroad of New Jersey had under construction the largest coal handling terminal in New York Harbor. This project was to include a complete yard layout with a duplicate system of thawing sheds and a reinforced concrete pier with two McMyler car dumpers on the inshore end for the transfer of coal from road cars to barges and schooners, together with a screening pocket and conveyor, and on the offshore end facilities for coaling tugs, steam lighters, etc., consisting of 42 reinforced concrete silos for the storage of tug coal, with hoppers, conveyors and other incident apparatus. The project involved the placing of 800,000 cubic yards of embankment in the yard and 10,700 cubic yards of concrete on the pier, exclusive of the offshore end, upon which work had not been started by August, 1919. There was approximately 23 miles of track, and the total expenditure was to be in excess of \$3,000,000. The new facilities replaced two old gravity-type coal piers having a combined capacity of about 1,750,000 tons of tidewater shipments and tug coal per year. The new pier was estimated to have a capacity of 6,000,000 tons of transshipment coal and 1,000,000 tons of tug coal per annum. The new terminal is located upon a filled area on which were constructed embankments in order to provide the necessary grades for the yard tracks. The material was obtained both from dredging and from cinders from the locomotive terminal at Communipaw. The complete pier was to be 1584 feet in length, the inshore section being 970 feet in length, with a maximum width of 184 feet at the bulkhead line, narrowing to 66 feet at the sea end of the section. The offshore section, used for the coaling of tugs, on which the concrete silos were to be placed, is 614 feet in length and 66 feet in breadth. By the summer of 1919 the inshore section was practically completed, with one dumper in operation, and work was suspended on the offshore or tug coaling section until the completed portion of the pier included a reinforced concrete dock and concrete foundations for the car dumpers, built on 4400 creosoted pine piles averaging 70 feet in length. Track trestles over which the cars were delivered to the dumpers and returned to the empty yard were built of reinforced concrete. The terminal includes a large and substantial power house, two thawing houses each 320 feet long by 51 feet wide, with a capacity of 24 cars per house, so that the coal can be thawed by forcing air heated to a temperature of about 180° into contact with the bottom and sides of the car, so that a car can be thawed in from 2½ to 3 hours. There is also a complete yard system, with receiving

and classification yards, with gravity approach secured by a hump. This plant is described in the *Railway Age* for Aug. 29, 1919.

CRISTOBAL PIERS. The increased use of the Panama Canal brought about a demand for greater terminal facilities at both Atlantic and Pacific entrances, and in order to meet present and future demands, considerable pier construction was put under way. At the port of Cristobal three piers, Nos. 9, 8, and 7, were built in the harbor, and pier No. 6 was under construction in 1919. The three completed piers had foundations of concrete cylinders to rock, structural steel floor system incased in concrete for protection, and structural steel sheds, but the scarcity of steel during the war caused modifications in the design of pier No. 6 and a concrete design was substituted for long span steel superstructure, alternate tide arches and beams spanning longitudinally the pier footings with concrete cross beams and decks.

PARIS DEVELOPMENTS. In connection with developing the navigation facilities of the Seine and deepening the northern French canals to permit access to Paris by coal barges and larger tonnage, there was active discussion during the year towards providing basins and other accommodations which would make Paris an inland port in much the same fashion as had been done by the Germans in Strassburg and other Rhine towns. The demolition of the fortifications afforded ample sites for basins and walls, and the first of these for which preparation was being made was at Pantin, which was to be served by the Est Railway, and the Paris Chamber of Commerce urged the municipal council not only to expedite this work, but to arrange for the laying out of other basins, notably between Aubervilliers, La Chapelle-St Denis, and at Bercy-Charenton. It was proposed to connect these basins with the canals, so that they would be in communication with the Seine and the northern canals, and furthermore equip them with large warehouses and modern plants.

DODECANESIA or the **DODECANESE.** (Greek for 12 islands.) A group of islands lying off the southwest coast of Asia Minor. The group consists of the southern Sporades, including the islands of Patmos, Lipsos, Cos, Leros, Calymnos, Rhodes, and others. The islands were occupied by the Italian forces during the war with Turkey, 1912-13. By the treaty of Lausanne, Italy agreed to restore the islands to Turkey, but the outbreak of the Balkan War prevented the execution of this agreement. The islands have since been claimed by Greece. The question of their disposition has not been settled, but was undertaken by the Peace Conference. See **WAR OF THE NATIONS.**

DOHERTY, CHARLES JOSEPH. Canadian representative at the Paris Peace Conference. He had been from 1891 to 1906 a judge of the Superior Court of Quebec, but devoted himself to politics and became a member of the House of Commons in 1908. In the Conservative cabinet of Sir Robert Borden, he held the portfolio of Minister of Justice, which office he was still holding during the Conference.

DOMINICA. See **LEEWARD ISLANDS.**

DOMINICAN REPUBLIC. A West Indian state occupying the larger and eastern part of the island of Haiti. Capital, Santo Domingo.

AREA AND POPULATION. The area of the country is estimated at 18,045 English square miles,

and has a population estimated (in 1913) at 708,000 inhabitants, but it is doubtful whether the population exceeds 600,000. The population is mainly composed of a mixed race of European, African, and Indian blood, but there are also some Creoles of Spanish descent, and many Turks and Syrians. The language of the people is Spanish, but the American patois is spoken along the frontier. Santo Domingo in 1918 had a population of 38,920, and Santiago de los Caballeros, of 52,266. San Pedro de Macoris, according to a less recent estimate had 20,000. Exact figures are difficult to obtain, and other estimates place these figures somewhat lower. Births, deaths, and marriages in 1918 were reported, respectively, 41,072, 10,071, and 3737. In 1918 the immigrants numbered 4988, a falling off from preceding years. A decree of April 4th prohibited until April 1, 1921, any attempt to induce laborers to leave the country for employment abroad by an offer of material compensation. Also forbade any vessels to undertake a voyage for the purpose of transporting laborers for employment in foreign countries.

EDUCATION. In 1918 it was reported that public instruction showed a greater development than in any previous year. The number of pupils in all the schools was 51,585 of whom 33,122 were in average daily attendance. The schools numbered 777 with 1209 teachers. The University of Santo Domingo had a faculty of 28 and a student body of 121. A plan was under consideration in 1919 for the establishment of a college of agriculture adjoining the experiment station in the city of Santo Domingo and a school of commerce was established in that city.

PRODUCTION. Agriculture is the chief occupation and the leading crops are sugar and cacao. No later figures for sugar production are available than those given in the preceding YEAR BOOK. As to cacao, 47,000,000 pounds were harvested in the Cibao during the year ending Aug. 15, 1919, which crop was worth to the growers over \$7,000,000. From this figure can be gained an idea of the importance of this crop in a community with an estimated population of not more than 100,000. For the 1919 tobacco crop, an unusually large area was prepared for cultivation, estimated from 25,000 to 30,000 acres, and on the general average yield it was expected to have a crop of 50,000,000 or 60,000,000 pounds, against the record yield of 35,000,000 pounds in 1918, but the drought in the early spring of 1919 caused a decrease in area planted, so that the revised estimates were for about 25,000,000 pounds. The other leading products of the Republic are coffee and honey.

COMMERCE. The foreign trade for 1918 amounted to \$42,108,496, of which \$19,736,152 were imports and \$22,372,344 exports. Compared with the year 1917, these figures show an increase in imports of \$2,336,088 and a decrease in exports of \$72,236, or a net increase of \$2,263,852.

RAILWAYS. The railroads are all situated in the northern part of the island, with the exception of privately-owned roads on certain sugar estates, which total about 255 miles. These roads are divided into two main lines: One, the Samaná-Santiago line, which belongs to an English company, runs from Sanchez to La Vega, a distance of 73 miles. This line has two branch lines which are under the same management, but different ownership, extending from

La Jina to San Francisco de Macoris (8½ miles) and from Las Cabullas to Moca (15 miles). Secondly, there is a government line, the Dominican Central Railway, which runs from Puerto Plata to Santiago and Moca, a distance of 60 miles. The total length of the line in 1917 was about 175 miles.

SHIPPING. In 1918 the shipping entered and cleared at ports of the Republic comprised 863 ships with a tonnage of 618,567 as against 1168 ships with a tonnage of 1,006,511 in the previous year. For the coastwise trade 365 foreign ships entered with a tonnage of 486,266 while the national vessels in the coastwise service numbered 7658.

FINANCE. The estimated revenue for 1919 was \$7,973,000 and the following expenditures were estimated: Interest and payment of the Dominican loan, interest and payment of the debt of 1918, appropriation for public instruction, expenses of the municipal government, public works and reserve fund, \$3,550,500; legislation, \$8280; executive department, \$28,360; judiciary department, \$558,630; interior administration and police, \$1,175,095; exterior relations, \$65,583; commerce and finance, \$487,304; justice and public instruction, \$462,500; agriculture and immigration, \$198,545; public works and communications, \$532,516. The figures of receipts and expenditures show a surplus of \$33,686.

HISTORY. The United States control dates from 1916 when the President was driven from power by the revolutionist Arias. On May 27th of that year the United States authorities issued their ultimatum demanding that the United States forces should be allowed peaceably to land. On June 1 the American marines landed and later a regiment was dispatched into the country to prevent a rising. There was desultory fighting and the regiment finally reached Santiago, where on Dec. 6, 1916, the American flag was raised. Since that time order has been maintained by American forces which consisted in 1919 of about 5000 marines. There was an American military Provost Marshal in the capital of each province who attended to the policing of the province. At the head of the administration was a Military Governor and Rear Admiral of the United States navy whose functions were like those performed some years before by General Wood in Cuba. According to reports in 1919, there were few active bandits left in the country, and it was safe to travel unarmed throughout every section. The administration continued mainly in the hands of the Dominicans who directed their own school system, their courts and their town governments. To the United States authorities was reserved the control of the treasury and customs and the appointment of the governors of the provinces. In 1919 there was as yet no president or congress, but native officials carried on the administration as they had done before, except that they were responsible to the United States government instead of to their own president. A feature of the American policy has been the creation of the Dominican National Guard, organized on the model of the United States Marine Corps which detailed from among its own officers the officers of the National Guard. In 1919 there were 14 companies of 80 men each, one company being stationed in the capital of each province. The men were enlisted exclusively from the native population. The new

force was reported to be well drilled and efficient. See EXPLORATION.

DOOLITTLE, CHARLES LEANDER. Astronomer, died at Philadelphia, Pa., March 3. He was born at Ontario, Ind., Nov. 12, 1843, and studied civil engineering at the University of Michigan. He served on the United States boundary survey from 1873 to 1875 when he became professor of mathematics and astronomy at Lehigh University holding that place until 1895. He was then appointed to the chair of astronomy in the University of Pennsylvania and he was also director of the Flower Astronomical Observatory (1895-1912). After 1912 he was made professor emeritus. Among his writings may be mentioned the following: *Practical Astronomy as Applied to Geodesy and Navigation*; *Results of Observation with Zenith Telescope*, Sayre Obs. (1876-95); *Results of Observation with Zenith Telescope*, Flower Obs. (1894-1911).

DOOR, ANTON. An Austrian pianist and famous teacher, died at Vienna, November 7. He was born in Vienna, June 20, 1833. Having established his reputation as a virtuoso in Germany, Italy, and Scandinavia, he succeeded Nikolai Rubinstein as professor at the Institute in Moscow. From 1869-1901 he taught with signal success at the Vienna Conservatory.

DRAINAGE. See RECLAMATION.

DRAMA, AMERICAN AND ENGLISH. In seasons of financial stringency, the commercial managers complain that, despite their love for art, they cannot afford to risk their capital in really earnest undertakings, because of the poor patronage of the theatre-going public. On the other hand, in seasons of financial prosperity, they forget all about their love for art and devote their energies to profiteering. Thus the drama loses either way. The year 1918 had been bad commercially, for the English-speaking theatre: but 1919, on the contrary, was a year of almost unprecedented prosperity, both in England and in the United States. The reason is obvious. The termination of hostilities on Nov. 11, 1918, resulted in a general feeling of relief and cheerfulness among the people of the victorious nations. After saving money for so long, they wished to spend it; and, after suffering for so long, they desired most of all to spend it for entertainment. Consequently, they kept the theatres crowded throughout 1919. But this period of prosperity, instead of being utilized by the managers as an opportunity for experimenting with the better things of the drama, was employed mainly to increase the commercial degradation of the theatre.

In New York, the managers, without advertising their intention, quietly raised the price of theatre-tickets from \$2 to \$3. For certain popular "shows" they charged \$5, and for one or two extravagantly advertised performances they even charged as much as \$10; but even this arrant exercise of profiteering could not keep the public away. Competition for the tenancy of theatres in New York became so keen that new productions were required to play to \$10,000 a week or else vacate the premises. Formerly the contract figure had stood at \$5000. Under this new condition, failure was decreed to any play which was not sufficiently commercial to attract the immediate patronage of the largest and least intelligent section of the theatre-going public.

In London, the developments of the year were

even more regrettable. The old order changed and yielded place to new. During the war several celebrated actor-managers had died,—such leaders of the English stage, for instance, as Sir Charles Wyndham, Sir George Alexander, and Sir Herbert Tree. Many prominent dramatists and actors had devoted their entire time to war work. While the lovers of the drama were not looking, a band of real-estate operators stepped in and bought up the leases of most of the London theatres. These dealers, imitating the example set by the American magnates, Mr. Erlanger and Mr. Shubert, succeeded in making the London stage more commercial than it had ever been before. It became difficult, if not impossible, for an important actor to secure a theatre for the production of a play by an important dramatist; and the best production of the year had to be housed in a derelict playhouse in Hammersmith. The West End theatres were given over almost entirely to musical "shows," frivolous farces, and popular but vulgar plays imported from America.

The leading British dramatists, Pinero, Jones, Barrie, Shaw, Galsworthy, and Barker, remained silent throughout the year, except that Shaw published a new volume, containing *Heartbreak House* and several short plays about the war, which did not increase his reputation and in some respects diminished his popularity. The few significant productions of the London season were subsequently reproduced in New York, and will be noted later in this article.

In the United States, the most important event of the year was the strike of the actors—a strike unique in history because it was not caused by any question of wages or of hours but was undertaken merely for a principle. Early in the summer, the real-estate magnates who control the American theatre, fearing the power that might accrue to the Actors' Equity Association if it should join the American Federation of Labor, organized a managers' union called the Producing Managers' Association. Subsequently the actors voted to ally themselves with organized labor. The managers' union then refused to recognize the corporate existence of the actors' union; and the Producing Managers' Association also refused to submit to arbitration two requests put forward by the Actors' Equity Association—first, that eight performances should constitute a working week and extra performances should be paid for pro rata, and, second, that after rehearsing four weeks without remuneration, actors should be paid half-salary for subsequent rehearsals. The organized actors called a strike on August 7th, and were soon joined by their allies, the organized stage-hands and musicians, who made no demands of their own. Within a few days nearly every theatre in New York was darkened, and many important theatres in other cities; and rehearsals of new plays were stopped entirely. The strike lasted for a month; and on September 6th the managers capitulated and granted much more to the striking actors than the Equity Association had originally asked. During the course of the strike, the entertainment committee of the organized actors, under the efficient direction of Lieut.-Col. Earle Boothe, put on a series of superlative "Equity Shows" which evoked great enthusiasm from the public. Perhaps the most important result of this month of internecine warfare in the theatre was the fact that the pub-

LORD DUNSANY

MAURICE MAETERLINCK

PROMINENT DRAMATISTS DURING 1919

lic was reminded that, although the actor is essential to the drama and the playwright also is indispensable, there is no absolute need for the so-called "manager."

This point was tested earlier in the year by the Theatre Guild, a group of artists who incorporated themselves for the purpose of producing plays on a coöperative basis. They took over an abandoned theatre in New York—the Garrick—and proceeded to produce the sort of plays that the commercial managers are always afraid of. Their first production, Jacinto Benavente's *Bonds of Interest*, attained a *succès d'estime*. Their second production, *John Ferguson*, by St. John G. Ervine, was announced for only a single week; but it was so enormously successful that it ran in New York for over 20 weeks and subsequently continued its career in other cities. This was one of the greatest plays of the year, and one of the most successful. Later in the season the Theatre Guild produced John Masefield's Japanese tragedy, *The Faithful*, and a dramatization of William Dean Howells' celebrated novel, *The Rise of Silas Lapham*, by Lillian Sabine.

In the domain of the classic drama, Walter Hampden's production of *Hamlet* remained the greatest event of the year. Unaided by any of the commercial managers, this masterly young actor played the part more than 200 times, in many cities, and was everywhere recognized as the finest exponent of the rôle since the death of Edwin Booth. E. H. Sothern and Julia Marlowe, after several years of retirement, returned to the stage with *Twelfth Night*, *The Taming of the Shrew*, and *Hamlet*, and played to crowded houses everywhere.

Among the American managers, the medal of honor for 1919 should be bestowed on Arthur Hopkins, who followed his interesting production of Tolstoi's *The Living Corpse* with a still more vivid projection of *The Jest*,—translated from *La Cena delle Beffe* of the Italian poet, Sem Benelli, by Edward Sheldon. This play, well known in Europe, is a violent and thrilling melodrama written in gorgeous verse. The leading parts were played by John and Lionel Barrymore, and the scenery was designed by Robert Edmond Jones. In December, Mr. Hopkins presented for a series of special matinées an excellent production of Maxim Gorki's dreary but powerful tragedy, *Night Lodging*.

Next in honor among the American managers came William Harris, Jr., who invested some of the profits of a lurid and unworthy melodrama, *East is West*, in importing to New York the two most worthy plays of the London season. One of these was *The Lost Leader*, by Lennox Robinson, an interesting drama derived from the legend, still current in Ireland, that Charles Stewart Parnell is still alive. The other was a chronicle-play on the subject of *Abraham Lincoln* by the English poet, John Drinkwater. This piece, despite its unusual simplicity, was extraordinarily impressive. The title part was excellently played by a little-known actor named Frank McGlynn. The author visited the United States to superintend the production and to deliver a series of lectures.

Stuart Walker continued the excellent record of his Portmanteau Theatre by reviving *The Book of Job*, and by producing for the first time *The Tents of the Arabs* and *The Laughter of the Gods*, by Lord Dunsany. The latter was a new

play, regarded by the author as his best. In the autumn, Lord Dunsany visited the United States for the first time and delivered many lectures.

Another distinguished visitor was Maurice Maeterlinck, who came to New York in December to attend the world-première of the operatic version of *The Blue Bird*. Earlier in the year, his war-play, *A Burgomaster of Belgium*, had been acted in New York. Though quite outside the usual vein of Maeterlinck, this simple study of actual life was easily the most impressive of all the many plays inspired by the war.

The French drama was less popular in New York in 1919 than it had been during the war. Jacques Copeau completed the second season of his Théâtre du Vieux Colombier. He continued to produce great plays, week after week, and to present them admirably; but the support of the public was discouraging, and, in the spring, M. Copeau took his company back to Paris, accompanied by the good wishes of many cultured patrons. In the autumn, Robert Casadesu brought over a new company from France and inaugurated the Théâtre Parisien, an institution devoted to frivolous farces and operettas; and a Belgian actor, Carlo Liten, undertook a more ambitious project, called the Théâtre d'Art, which was introduced by an impressive production of *Le Cloître*, a tragedy by Emile Verhaeren. Yvette Guilbert made a beautiful production of an interesting old French miracle-play, *Guibour*, and acted for the first time in English in the title part; she continued her recitals in French; and, in the autumn, this great artist founded a School of the Theatre in New York. The only important French play which was produced in English in 1919 was *The Marquis of Priola*, by Henri Lavedan, which was admirably acted by Leo Ditrichstein.

The Jewish Art Theatre took possession of the abandoned Garden Theatre in New York and gave a series of excellent productions in the Yiddish language, under the direction of the celebrated German actor, Emanuel Reicher. Among the plays produced were *The Idle Inn*, by Peretz Hirshben, *Lonely Lives*, by Gerhardt Hauptmann, *The Dumb Messiah* by David Pinski, and a Danish play called *Samson and Delilah*. The *mise-en-scène* was admirable; and the acting of Jacob Ben-Ami was particularly notable.

Mention should be made of a worthy production in English of *Shakuntala*, a celebrated ancient Hindu drama by Kalidasa. This was set forth at the Greenwich Village Theatre by Frank Conroy and Harold Meltzer.

Except for John Drinkwater, the only English playwright who achieved a notable success on the American stage in 1919 was W. Somerset Maugham. *Too Many Husbands* (called in London *Home and Beauty*) was a delightfully witty farce; and *Cæsar's Wife* was a respectable, though not emphatically moving, contribution to the serious drama. Among the poor plays imported to New York from England were *Penny Wise*, *Three for Diana*, and *Carnival*.

Booth Tarkington may be singled out from the other American playwrights as the one who most materially increased his reputation in 1919. His comedy called *Clarence*, though slight in substance, may be regarded as the best American play of the year. It was deliciously whimsical, and presented a faithful picture of a representative American family. Mr. Tarkington was less

successful with another comedy, called *Up from Nowhere*, which was written in collaboration with Harry Leon Wilson. An operatic version of Mr. Tarkington's famous novelette and play, *Beaucaire*, with music by André Messager, was presented in London with great success by Gilbert Miller and subsequently imported to New York.

The war-play became obsolete in 1919; but several after-the-war plays were presented, which dealt with the social problems of the returned soldier. Of these the most interesting was *Civilian Clothes*, a comedy by Thompson Buchanan, in which an aristocratic heroine who had married an American captain in France was subsequently shocked when she saw him out of uniform, by the discovery that he was neither well born nor well bred. *The Five Million*, by Gray Bolton and Frank Mandel, treated the status of demobilized soldiers who found their former jobs occupied by women. *Buddies*, by George V. Hobart, revealed a pleasing picture of the A. E. F. in a rest-camp in Brittany; and *Forbidden*, by Dorothy Donnelly, dealt more seriously with the dramatic aspects of the American occupation of Coblenz. Anthony Paul Kelly, in *The Phantom Legion*, tried unsuccessfully to dramatize the spiritistic theory that dead soldiers continue to fight beside their living comrades.

The menace of Bolshevism was treated in a journalistic manner by Eugene Walter in *The Challenge*, an emphatic and fairly effective play. The same subject was very badly handled by Thomas Dixon in *The Red Dawn*.

Particular attention may now be devoted to those American plays of 1919 which revealed a certain amount of originality, and some positive degree of merit, of one kind or another. Augustus Thomas, the dean of American dramatists, contributed *Palmy Days*, a mellow tale of California in the mining days of '49, which was agreeably reminiscent of Bret Harte. Salisbury Field came forward with a really brilliant comedy, called *Wedding Bells*, in which the hero fell in love with his divorced wife on the eve of his contemplated second marriage. Zoe Akins offered a clever comedy, *Papa*, which failed, and a somewhat less able serious drama, *Déclassée*, which enjoyed a great success because of the excellent acting of Ethel Barrymore. Henry Miller and Blanche Bates appeared in *Molière*, an ambitious romantic drama by Philip Moeller; and, later in the season, these same artists produced an excellent comedy by James Forbes, *The Famous Mrs. Fair*, which dealt with the problem of the woman torn between her ambition for a public career and her duty to her family. Mrs. Fiske gave a delightful performance in a pleasing comedy by Laurence Eyre, *Miss Nelly of N'Orleans*. Tillie, by Helen R. Martin, was a study of local life among the Mennonites. *Adam and Eva*, by George Middleton and Guy Bolton, was one of the most workmanlike plays of the year, though it dealt with traditional materials. Rachel Crothers revealed once more her usual fidelity of observation in a comedy of boarding-house life called *39 East*. In *The Gold Diggers*, Avery Hopwood set forth a humorous depiction of the life of the chorus-girl. *Moonlight and Honeysuckle*, a somewhat artificial comedy by George Scarborough, was pleasantly played by Ruth Chatterton. Grace George gave a very fine performance in *She Would and She Did*, an ex-

tremely light comedy by a new author, Mark Reed. *I Love You*, by William Le Baron, was a fairly clever farce; but much more amusing was another farce, entitled *My Lady Friends*, by Emil Nyitray and Frank Mandel, in which Clifton Crawford gave an ingratiating performance. *His Honor, Abe Potash*, by Montague Glass and Jules Eckert Goodman, offered an excellent acting part for Barney Bernard; and a little known actor named Harry Beresford scored a remarkable success in *Boys Will be Boys*, which was dramatized by Charles O'Brien Kennedy from a series of stories by Irvin S. Cobb. *On the Winning Lane*, by Harriet Ford and Harvey J. O'Higgins, dealt amusingly with the servant problem. *Five O'Clock*, by Frank Bacon and Freeman Tilden, showed several elements of merit; but it was not nearly so successful as Mr. Bacon's previous play called *Lightnin'*, which ran throughout the entire year. *One Night in Rome*, an uneven play by J. Hartley Manners, disclosed Laurette Taylor to great advantage in the leading part. *Curiosity*, by H. Austin Adams, was an interesting study in the psychology of sex; and *Our Pleasant Sins*, by Thomas Broadhurst, deserves to be remembered as a serious attempt at serious drama.

There was an epidemic of bedroom farces in 1919. The following new plays all employed the traditional Palais Royal pattern, with different variations.—*Keep it to Yourself*, *Up in Mabel's Room*, *Please Get Married*, *A Sleepless Night*, *Nightie Night*, *An Exchange of Wives*, and *The Girl in the Limousine*. Of these the most skillful was *Nightie Night*, by Martha M. Stanley and Adelaide Matthews, in which Francis Byrne gave an excellent performance. In *Scandal*, Cosmo Hamilton essayed to lift the bedroom play to the level of serious drama; but his effort, though commercially successful, was artistically false.

There was also an epidemic in 1919 of melodramas that detailed a murder mystery; and the following plays—all interesting in one way or another—had similar plots:—*The Woman in Room 13*, by Max Marcin and Samuel Shipman; *At 9:45*, by Owen Davis; *The Crimson Alibi*, by George Broadhurst; *A Voice in the Dark*, by Ralph E. Dyar; *The Sign on the Door*, by Channing Pollock; and *For the Defense*, by Elmer L. Rice. Plays of this type were cleverly satirized by Thomas Springer in a burlesque melodrama entitled *Where's Your Wife? The Son-Daughter*, by George Scarborough, was a melodrama of the Sardou type, set in Chinatown for purposes of local color, and sumptuously produced by David Belasco.

The following American plays of 1919 were inferior in quality, and need be listed merely for purposes of record:—*Toby's Bow*, *Cappy Ricks*, *Hobohemia*, *The Nct*, *The Fortune Teller*, *A Good Bad Woman*, *Dark Rosaleen*, *Those Who Walk in Darkness*, *A Regular Feller*, *Lusmore*, *Thunder*, *The Dancer*, *The Storm*, *A Young Man's Fancy*, *The Unknown Woman*, *Three's a Crowd*, and *The Whirlwind*.

In December, two huge and costly spectacles were exhibited in New York. *Aphrodite*, a pagan picture of the licentious life of ancient Alexandria, was produced by Comstock and Gest at the Century Theatre; and *The Wayfarer*, a modern passion play, was produced by the Inter-church World Movement in Madison Square Garden. Hundreds of collaborators were em-

ployed in each of these gigantic undertakings. Setting aside any question of subject-matter, and confining the judgment solely to matters of art, it must be said that the sacred spectacle was, in nearly all respects, more impressive than the profane.

DRUG ADDICTION. The New York County Medical Society held an important session on the subject of the federal and State Drug Laws last May. Legal authorities explained to the members the provisions of the laws and the court decisions rendered by the Supreme Court on test cases. These were concerned with the nature of "personal attendance," of "prescriptions," "professional practice," etc. There is a distinction between "personal" attendance and "medical" attendance, for in the latter more latitude is allowable. Personal attendance implies that the physician attends the patient before writing a prescription, presumably at his, the patient's, house. A prescription was defined as "written or spoken medical directions" or "remedies indicated." "Professional practice" had not yet been finally defined. It transpires incidentally that the Harrison Federal Law is only an internal revenue tax law. Beyond this the State is responsible. An important case was nearly lost by the government, for the Supreme Court decided, 5 to 4, that the vital point concerned was the raising of revenue. It was charged against the accused that the distribution of a large amount of narcotic to an addict by a medical man was not professional practice. The defense that the Harrison Law was unconstitutional had been upheld by a lower court. But in a somewhat similar case the Supreme Court decided against the government and in favor of the view that an order for morphine to an addict to quiet his nerves is not a prescription and the service does not fall under professional practice. Narcotic Commissioner Herriek claimed that the legitimate physician, acting in good faith, has nothing to fear from the State law. The main aim of the latter is complete control of the addict, even after his apparent cure, and here the medical profession has its chance to cooperate with the State. Dr. Copeland, the Health Commissioner of New York, stated that the medical profession will not treat the addict, so that the latter becomes a problem for the Health Department. During the winter of 1918-19 the number of addicts had notably increased and a total of 60,000 for the entire city was a conservative estimate. Nearly 500,000 pounds of opium reached this country in 1917 and the per capita amount for the entire country was 33 grains per annum—10-fold that of any other country. To catch the dishonest doctor and bootlegger both the federal authorities and local police would have to cooperate with the Health Department. Justice Collins likened the spread of the drug evil to an epidemic which necessitates drastic measures for its suppression. The business is largely in the hands of the underworld and in about half the cases of offenses against the drug law the offenders had been arrested on other complaints. During 1918, and in the early months of the present year, there had been a remarkable falling off in arrests of those with narcotics in their possession. According to Commissioner of Correction Hamilton about one-half of the addicts who come before his department have criminal records. Drugs led to crime much more frequently than crime to drugs.

The dishonest physician had no intention of curing any addict by reducing his quota of drug. Alcoholism is much less a menace, for it does not develop as a rule in the adolescent, its use can be discontinued by the young man even after several months of daily use, it can only be drunk and not injected or sniffed.

Dr. Dunnez of the U. S. Public Health Service stated that 20 of the States had reported an increase in the use of narcotics and there is some increase in dry territory where paregoric and proprietaries containing opium are used to some extent. Dr. Bishop justly protested against styling all addicts "liars" in advance. This is not only unjust but impolitic, for it interferes with the registration. Clergymen and judges do not care to register themselves as liars while in the discharge of professional functions.

DUNKARDS or DUNKERS. See **BRETHRENS, CHURCH OF THE.**

DUNLOP, SIR NATHANIEL. British ship-owner, died in London, November 15. He was formerly the chairman of the Allan Line Steamship Company. He was born in 1830 and educated in common schools. He became one of the managing directors of the Allan Line and rose to its chairmanship. He was the author of various pamphlets on commercial subjects and of magazine articles.

DUPUY, JEAN. French journalist and cabinet officer. He was born in the Gironde, France, Oct. 1, 1844. He was a member of the cabinet on three occasions and once president of the Council. During the war he was a member of the War Council which cooperated with the ministry. He held a seat in the Senate from Hautes Pyrénées. He was chiefly known however as a prominent figure in Parisian journalism, having been for many years a director of the *Petit Parisien*. He was active in organizing the press of Paris and was president of the syndicate of Paris newspapers. He took a leading part in the effort to maintain the rights of the press against the rigid censorship.

DUTCH EAST INDIES. A colonial possession of the Netherlands, comprising the Dutch possessions in Asia, situated between 6° N. and 11° S. latitude and between 95° and 141° E. longitude. Capital, Batavia.

AREA AND POPULATION. There are two main divisions: First, Java (16 residencies) and Madoera (1 residency); and secondly, the outposts, consisting of 17 provinces. The approximate area is 735,000 English square miles, with a total population in 1917 (official estimate) of 47,000,000. The population of the four principal towns of Java was: Batavia (1917) 231,463; Samarang (1916), 109,915; Soerabaya (1915), 157,202; and Soerakarta (1905), 118,378.

PRODUCTION. Area (end of 1917) under rice, 4,030,469 acres; maize, 1,303,680 acres; cassava, 1,021,824 acres; arachis, 162,117 acres; soya beans, 38,076 acres; other secondary crops, 580,085 acres; sugar-cane, 31,842 acres; tobacco, 10,992 acres; indigo, 5869 acres; and capsicum, 16,326 acres. Government coffee plantations in 1917 produced 1758 tons (Java), and from private estates (Java) was raised 71,682 tons. Tobacco in 1917 (Java) 25,930,000 kilograms, and (Sumatra) 20,550,000 kilograms, a total of

46,489,000 kilograms. Cinchona, in kilograms, was equal to a total of 8,009,148, in 1917. The production of tea in the country for 1917 was estimated at 43,271,000 kilograms, while in 1918 the exports of tea from Java alone totalled 27,735,892 kilograms. For the first four months of 1919 Java and Sumatra alone exported over 14,000,000 kilograms. Cacao (Java, 1917), 1,189,790 kilograms. The government tin mines of Banca yielded in 1917-18, 20,322 tons. This figure includes the output from all other tin mines as well, chiefly the private mines at Biliton and Riau. The yield of the principal coal mines in Java, Sumatra, and Borneo in 1917 was 816,578 tons. Petroleum and other mineral oils (1917), 1,747,014,000 kilograms. Gold, silver, diamonds, copper and manganese are mined.

COMMERCE. Government and private trade, merchandise and specie, are given below for 1916 and 1917 in guilders (12 guilders = £1).

		IMPORTS					
Year	Merchandise	Government	Total		Private		Grand total
		Specie		Merchandise	Specie	Total	
1916 . . .	16,519,407	400,000	16,919,407	404,723,739	24,608,794	429,332,713	446,252,120
1917 .	20,361,000	1,600,000	21,961,000	467,019,000	7,705,000	474,724,000	496,685,000
EXPORTS							
1916 . . .	11,157,482	169,750	11,327,232	856,656,564	172,750	856,829,314	868,156,546
1917 . . .	1,670,000	149,000	1,819,000	785,110,000	6,300,000	791,410,000	793,229,000

The chief receiver of exports is the Netherlands. These consist chiefly of sugar, coffee, tea, indigo, tobacco, cinchona, copra, and tin. Rice is shipped in large quantities to China and Borneo. In 1917 there entered at the ports 7934 steamers and 6000 sailing vessels, a total of 3,140,024 tons and 342,517 tons respectively.

JAVA. The import and export trade of the island of Java may be shown by a table showing the increase of commerce of that island with the United States. Nearly 80 per cent of the total population of the Dutch East Indies live in Java. The following table shows the imports and exports with the United States, expressed in guilders (guilder = \$0.402):

Years	Imports from U. S.	Increase	P.C.	Exports to U. S.	Increase	P.C.
1914	6,200,000	10,900,000
1915	11,500,000	5,300,000	85	26,600,000	15,700,000	144
1916	25,300,000	13,800,000	120	68,500,000	41,900,000	157
1917	47,400,000	22,100,000	87	141,800,000	73,300,000	107

Japanese trade with Java in 1917 showed an increase of about 300 per cent over the same period in 1915, the figures being, respectively, 37,000,000 yen (yen = \$0.498) and 9,000,000. The trade with Japan and the United States has replaced that with the German commercial interests.

FINANCE AND GOVERNMENT. The territory is under the sovereignty of the Netherlands, consisting partly of lands directly under control of the Dutch and those under the rule of native states. The revenue and expenditures, expressed in guilders, for 1919, were, respectively, 390,190,370 and 503,839,724, a deficit of 104,440,354 guilders. The governor-general, who is at the head of the administration, is assisted by a council of five members, whose functions are both legislative and advisory. The governor-general is nominated by the sovereign, as are the members of the council. In 1897 a council was created to con-

sider budget questions. In 1919, the governor-general was Dr. J. P. Count Van Limberg Stirum, appointed Oct. 28, 1915.

DUTCH GUIANA, or SURINAM. A colony of the Netherlands, lying on the northern coast of South America, between 2° and 6° N. latitude and 53° 50' and 58° 20' E. longitude. It is bounded on the north by the Atlantic Ocean, on the east by the River Marowijne, which divides it from French Guiana, on the west by the River Corantyn, dividing it from British Guiana, and on the south by inaccessible forests and savannas to the Tumuc-Humas Mountains. It has a total area of 46,060 square miles (English), and a population on Jan. 1, 1918, of 92,284, exclusive of the negroes and Indians in the forests. Capital, Paramaribo, 37,051 population. In 1917 there were 31 public schools, with 7508 pupils, and 44 private schools with 3318 pupils. There is also a government normal school. In 1917 the leading religious denominations were Moravian Brethren,

24,624; Roman Catholics, 19,698; Hindus, 20,850; Jews, 847; Mohammedans, 12,489; and Reformed and Lutherans 9773. Sugar production in 1917, 14,360,100 kilograms; cacao, 1,987,200 kilograms; bananas, 563,400 bunches; coffee, 1,546,000 kilograms; rice, 5,338,300 kilograms; maize, 1,608,300 kilograms; rum, 836,100 litres; and molasses, 658,000 litres. Gold yield in 1917 was 808,404 grams, of which was exported 701,343 grams, valued at 981,880 guilders. Total imports (1916), 5,911,326 guilders; total exports, 8,054,002 guilders; local revenue (1917), 3,193,000 guilders; subvention, 1,676,000 guilders. Governor, 1919, G. J. Staal.

DUTCH REFORMED CHURCH. See REFORMED CHURCH IN AMERICA.

DUTCH WEST INDIES. The term includes CURACAO and DUTCH GUIANA (q.v.).

DUTTON, SAMUEL TRAIN. American educator, died March 18. At the time of his death he was professor of educational administration in Teachers' College, Columbia University, an office which he had held for many years. He was born at Hillsboro, N. H., Oct. 16, 1844, and graduated at Yale, 1873. He held various educational and administrative positions in Connecticut where he was superintendent of schools in New Haven from 1882 to 1890. For the next 10 years he was superintendent of schools at Brookline, Mass., and then was professor of school administration in Teachers' College, 1900 to 1915, when he was made professor emeritus. Meanwhile he had been engaged in a wide range of educational activities, serving as a lecturer

on pedagogy at Harvard, the University of Chicago, and at Boston University and as exchange lecturer at the Scandinavian universities (1910). He also served as trustee and administrator of important educational foundations and was a member of the International Commission on the Balkan War (1913). He was associate editor of *Christian Work* and of the *World Court Magazine*. After his retirement in 1915 he devoted himself especially to the cause of international peace.

DUVENECK, FRANK. Painter, died at Cincinnati, Ohio, January 3. He was born at Covington, Ky., 1848, studied in Munich for more than 10 years and specialized in portrait and figure painting. After 1881 he lived almost continually at Florence, Italy. The Chicago Exposition medal was awarded to him in 1893, that of the National Academy in 1906, and the special Gold Medal of Honor of the Panama Exposition in 1915. At first his style was marked by great brilliancy but later became quiet in color. A large number of his paintings are in this country, including the "Turkish Page and Recumbent Figure" in the Pennsylvania Academy, and nine paintings in the Cincinnati Museum. Among his other paintings may be mentioned "A Circassian" (1875), a Portrait of Charles Dudley Warner (1877), and "The Professor" (1878). Duveneck also displayed marked ability as a sculptor.

DYNAMO-ELECTRIC MACHINERY.

The year 1919 was not marked by the construction of any notably large generators, the 45,000 kw. turbounit of the Narragansett Electric Lighting Co. at Providence, R. I., put in operation during the previous year marking, for a time at least, the limit of size for such machines. Many of the generators installed during the year, however, were rated at from 25,000 to 35,000 kilowatts, so that the average size of those built and put in use was greater than ever before. Generators and motors were in good demand, but at times it was difficult to rely upon scheduled deliveries, owing to delays in the receipt of raw materials at the works of the large manufacturing companies. There was a steady replacement of steam engines by electric motors for operating mills and factories. Nor was this tendency confined to any one line of industry: rolling mills, cement plants, textile mills, and pumping stations being among those installing electric drive either directly applied, or through the medium of belts and short line shafts. Motors to the amount of 40,000 horse power capacity were installed during the year in iron and steel mills alone.

At Niagara Falls, three 32,500 kw. generators were in process of installation for the Niagara Falls Power Company, differing from others at that location in that they were placed far down in the wheel pit, for the purpose of avoiding a long vertical shaft, with its objectionable lateral vibration. Each hydraulic turbine constituting the prime mover was rated at 37,500 horse power and was designed to operate at 150 revolutions per minute. The electric generators were designed to deliver three-phase, 25-cycle alternating current at 12,000 volts. The total weight of the generator was 300 tons (272,108 kg.). This entire unit was constructed by the Allis-Chalmers Company and was put in operation on Dec. 27, 1919.

EADY, SIR CHARLES SWINFEN. British jur-

ist, died in London, November 15. He was born July 31, 1851; called to the bar in 1879; from 1891 to 1913 was judge of the chancery of the High Court of Justice. He was Lord Justice of Appeal till 1918 when he was made Master of the Rolls.

EAGAN, CHARLES PATRICK. Brigadier-General, died in New York City, February 1. He was born in Ireland, Jan. 16, 1841, and educated at San Francisco. He served during the Civil War and afterwards against the Indians. He became captain of commissary subsistence in 1874, major in 1892, commissary-general in 1898. He retired after 30 years of service.

EARTHQUAKES. The list of seismic disturbances for 1919 included several destructive shocks, but none that inflicted widespread disaster like some of the occurrences of previous years. A series of tremors centred near the city of San Salvador, Central America, partly destroyed that city and its environs on April 28th, the destructive waves spreading outward for a distance of 10 or 12 miles from the origin. The zone of disturbance nearly coincided with the area visited by the earthquake of June 17, 1917, when the damage was greatly augmented by a sympathetic outburst of the volcano Quetzaltepeque which in the more recent disturbance remained quiescent. The number of victims was placed at 40 killed and several hundreds injured. The island of Fuerteventura, one of the Canaries, experienced a shaking early in May that accounted for considerable damage and a few lives. Violent tremors were reported on June 29th throughout the provinces of Florence, Arezzo, and Siena in Central Italy. They seem to have been centred about the village of Vecchio, 15 miles northeast of Florence (the city) and on the western slope of the Apennines, which with the town of San Lorenzo was badly shaken. More or less damage to property was reported within the three provinces named and the loss of life was put at 200, besides several thousands injured. The shocks began about 6 A. M. and continued throughout the day with increasing violence, reaching their maximum intensity at 5 o'clock in the afternoon. The Italian government took prompt measures for the relief of the devastated district. A fairly strong but not destructive shock was felt in Rome, Italy, on October 21st, and two heavier shocks were reported in the Tiber Valley on November 7th. The vicinity of Cannes on the Riviera experienced slight tremors on November 28th. On the following day shocks occurred in the region south and southwest of Toulouse, France, near the foot of the Pyrenees. They were not productive of much damage. A more serious disturbance was reported to have visited western Asia Minor on November 27th, causing the destruction of seven villages and many lives; the zone of maximum disturbance was in the districts of Soma and Balıkesir, north of Smyrna and 30 miles from the Mediterranean coast.

SEISMOLOGY. H. F. Reid and S. Taber described the Porto Rican earthquake of 1918 (*Bulletin Geol. Soc. Amer.*), which inflicted serious losses in lives and property. The shocks originated off the northwestern corner of the island, at a point where the sea bottom slopes off abruptly to great depths, and set up considerable sea waves of which the largest reached a height of 20 feet and swept over the low coastal area. The first tremors were the strongest and

were sensible over all the island and as far away as the western part of Haiti and the northern Lesser Antilles. Earthquakes have been infrequent in Porto Rico, only one other heavy disturbance (1867) having occurred since the time of Columbus. The shock probably came from crustal displacement along a submarine fault line, which is approximately marked out by the abrupt slope of the shore.

EAST AFRICA PROTECTORATE. A British dependency, extending from the former German East Africa to Abyssinia and Italian Somaliland, from the Umba to the Juba rivers, and inland as far as Uganda. For administration purposes, it is divided into seven provinces, in turn divided into districts and sub-districts, each province under a provisional commissioner. The provinces, with their respective capitals are as follows: Seyidie (Mombassa); Ukamba (Nairobi); Tanaland (Lamu); Jubaland (Kismayu); Kenya (Nieri); Naivasha (Naivasha); and Nyanza (Kisumu). It was proclaimed a territory on Nov. 19, 1890, and from March, 1891, to July, 1893, it was administered by the Imperial British East Africa Company. The East Africa Protectorate includes all the coast from the Umba to the Juba rivers. This was granted on a 50-year lease by the Sultan of Zanzibar. There is also a large tract in the interior, whose boundaries were defined by the Anglo-German conventions of 1886-90 and 1893, and the agreement with Italy in 1891. The administration is carried on under the colonial office, and has been under a governor and commander in chief, assisted by an executive and a legislative council since Nov. 9, 1906. The protectorate has an area of 246,822 square miles, and a population, estimated unofficially in 1919, of 2,807,000, including 5362 Europeans and 17,000 Asians. Swahilis and Arabs predominate on the coast. Races speaking Bantu languages and non-Bantu tribes such as the Masai, the Somali, and the Gallas, are further inland. The largest town is Mombassa, which had a population, unofficially estimated in 1919, of 300,000, of whom 130 are Europeans. It has a harbor situated on the eastern side of Mombassa Island, which is the terminus of the Uganda Railway. The two principal rivers in the north are the Tana and Juba which flow into the Indian Ocean; both navigable for 400 miles by steamers of shallow draught. The capital of the Protectorate is Nairobi, which had 14,000 inhabitants in 1919, of whom 800 were European and 3000 Indian. There were also 400 European farmers and 50,000 natives in the section adjacent to Nairobi. Agricultural products are essentially tropical, including rice, maize, various native grains, casaba, coconuts, etc. In 1919 there was considerable attention given to cotton growing on the banks of the Juba River. The production on an extended scale of sisal hemp and Ceara rubber is now being undertaken. In the highlands, the crops are similar to those of the temperate zone, consisting mainly of grains and European vegetables, with particular emphasis on wheat. In 1919, several new coffee plantations were established, adding considerable impetus to that industry. One of the principal industries of the country is the growing of black wattle. Dairying and ostrich farming are also profitable.

There is a forest area in the Protectorate which covers 3200 square miles, 138 square miles

of which is tropical forest, the remainder containing valuable timber trees. Mangroves, rubber trees, ebony, copal, and other trees grow in abundance near the coast, while the witu timber provides furniture woods. However, the valuable forested area lies in the highlands, to the west and north of Nairobi.

The extent of the mineral resources of the country have not yet been fully ascertained. Several large deposits of natron and diatomite had been discovered. Gold, in small quantities, had been found. Graphite and marble deposits have been located, and manganese had been discovered in the sandstones near the coast. The Uganda Railway has a length of 618 miles, owned by the state, and its cost amounted to nearly \$19,000,000 down to March 31, 1918. Communication between the ports of the Protectorate is maintained by small steamers, and the mail service between the United Kingdom and the Protectorate had been very irregular in 1919. Various commercial and financial figures for 1917-18 are as follows: Imports, £2,809,681; exports, £1,741,938; customs, £254,256; tonnage entered and cleared, 1,170,472. The chief imports during 1917-18 came from the United Kingdom, to the amount of £1,253,695; from the British possessions, £839,659; £188,773 from the United States, and £91,548 from Holland. The chief exports during 1917-18, including those also from Uganda and the Congo: Cotton, £711,770; hides and skins, £250,082; grain and oil seed, £39,452; fibres, £229,898; ivory, £44,867; coffee, £177,632; and copra, £18,904. Governor at the beginning of 1919, Maj.-Gen. E. Northey, C.B. See AGRICULTURAL EXPERIMENT STATIONS.

EAST ST. LOUIS FLOOD PROTECTION. See FLOOD PROTECTION.

EASTON, PA. See SEWERAGE.

EBERT, FRITZ. President of the German Republic. He succeeded Prince Max of Baden as Chancellor of the Empire on Nov. 9, 1918. He was of humble origin and during his youth worked as a tailor and bourrellier. Later he succeeded in purchasing a printing establishment and wrote for the press of Bremen. He early became prominent among the Socialists and in 1908 was elected to the Reichstag where he took every occasion to discuss the military budget and to press the claims of Socialism. At the beginning of 1916 he was elected president of the Socialist group in the Reichstag. He defended vigorously the submarine campaign. In 1917 he presided at the Socialist Congress at Wurzburg, where he was appointed leader of the Socialist Majority party. He was spokesman of this group, in its vacillating policy during the war when it was sometimes fiercely aggressive, and at others disposed to conciliation, according to the ups and downs of the German armies. It was this element which voted the famous July resolution on July 19, 1917. In September, 1918, it was he who appealed for peace to the Reichstag, and later he issued a proclamation demanding an armistice. Previous to this, even in July, he had foreseen the coming of defeat and demanded that the war should cease. It was this foresight which made him prominent when the question of a successor to Prince Max arose in November. Prince Max himself designated him as his successor. The office of chancellor was suppressed a few days later, and when the new government was constituted he became the most prominent member in it, having more influence

with the public than any of his colleagues who at that time were Scheidemann, Haase, Barth, Landsberg, and Dittman. The Independents turned against him and the Spartacus movement threatened to turn Berlin into a second Moscow. After some hesitation Ebert resorted to force and crushed the outbreak in the streets of Berlin. He carried out the measure for the elections which resulted in the National Assembly, and in March, 1919, he was proclaimed by that Assembly President of the German state. He had developed his programme on February 6th when the Assembly opened. In brief it was as follows: The reconstitution of Germany; the preservation so far as possible of its territorial integrity; the welcoming of Austria as a part of the German Republic, provided she would consent to it; the republic to be federative in name, but more strongly centralized than the Empire.

ECLIPSE. See ASTRONOMY.

ECOLOGY. See BOTANY.

ECONOMIC ASSOCIATION, AMERICAN. See POLITICAL ECONOMY.

ECUADOR. A republic of South America on the Pacific Coast between Colombia on the north and Peru on the south. Capital, Quito.

AREA AND POPULATION. Area estimated at 116,000 square miles, but the figures are doubtful on account of the uncertainty as to the boundary. The boundary dispute with Peru was still open and although the dispute with Colombia was settled in 1917 the adjustments under the treaty had not been made known. Including Galapagos which is an archipelago administered by a territorial governor, the area was estimated at 118,000 to 119,000 square miles. The population in 1903 was 1,323,900; in 1915, estimated, 2,000,000.

EDUCATION. Since November, 1912, radical changes have been made in the system of public

instruction. New courses of study in the primary schools were introduced in March, 1916, and already changes had been made in the system of the normal schools in 1915. In 1916 the higher education was reorganized and in 1918 new features were introduced in high school courses. The courses were divided as in the other Latin-American countries into primary, secondary, and high. Primary instruction is free and obligatory on all children beginning with the sixth year. The elementary and grammar schools are for children between the ages of six and 12, and the high schools for children who have passed through these lower grades, which are compulsory. In 1919 the schools in operation in the Republic were reported as follows: Mixed schools, 103; primary schools, 241; grammar schools, 122; high schools, 16; fiscal schools, 385; municipal schools, 57; private schools, 40; total enrollment about 48,505; and regular attendance, about 41,090. Secondary or high school instruction is given in the national colleges, entrance to which requires the pupil to have attained the age of 12 years and completed all the obligatory courses of primary instruction. There is at least one national college in each of the provinces with the exception of Esmeraldas. The number of students entered in the respective colleges in 1917 was reported as follows: Bolívar de Tulcán, 19; Teodoro Gómez de la Torre, 59; Mejía, 292; Vicente León, 67; Bolívar de Ambato, 65; Maldonado, 100; Pedro Carbó, 70; Juan B. Vazquez, 76; Benigno Malo, 240; Bernardo de Valdivieso, 105; Nueve de Octubre, 53; Espejo, 50; Vicente Rocafuerte, 299; and Olmedo, 44.

COMMERCE. The exports to the United States invoiced at the American Consulate-General and Consular Agencies in 1917 and 1918 are as follows:

	Articles		1917		1918

Export trade as registered at the Port of Guayaquil in 1918 showed the United States to be far in the lead with 78 per cent of the total amount exported. Chile received 7.8 per cent; the United Kingdom 5.8 per cent and then came Spain and Peru each with considerably less.

SHIPPING AND RAILWAYS. Almost all vessels call at the port of Guayaquil. The nationality and shipping statistics for 1917 and 1918 are supplied by the United States Bureau of Domestic and Foreign Commerce as follows:

Nationality	Entered		1917		1918		1918	
	No.	Tonnage	No.	Tonnage	No.	Tonnage	No.	Tonnage

Steamers and sailing vessels entered with 40,234 tons of imports and cleared with 40,531 tons of exports. The imports of the previous years aggregated 62,321 tons, the exports 45,792 tons, which was nearly 36 per cent more imports and nearly 11.5 per cent more exports than were shipped in 1918. The considerable decrease in steamer tonnage in 1917 over that of the previous year continued during 1918, and showed a difference of 26 per cent. It is evident that the tonnage used in carrying the freight to and from Guayaquil is greatly in excess of that actually required.

There is a railway from Duran to Quito with a total length in 1917 of 365 miles. Local authorities have undertaken the development of lines for local trade.

FINANCE. Gold is the standard and the monetary unit is the sucre, of which the value is \$0.48665. The revenue and expenditure from 1916 to 1919 inclusive, the last named year being estimated, are as follows:

	1916	1917 and 1918	1919
Expenditure	£1,796,496	£1,829,733	£1,685,980
Revenue	1,828,865	1,660,537	1,685,980

On Jan. 1, 1918, the foreign debt was £3,400,160 and the internal debt was £1,892,350. In 1918 there was a remarkable fluctuation in the

rate of bank exchange. The rate was 2.43 sucres to the dollar during the first nine months but before the close of the year it rose as high as 3.3. This led to the appointment of an advisory council to the minister of finance who was empowered to fix the bank rate of exchange. This he did, placing it at 2.43.

GOVERNMENT. Executive power is vested in a President elected directly by the people; the legislative power in a Congress consisting of two houses, of which the first comprises 32 Senators,

two for each province chosen for four years, and the second 48 Deputies elected for two years. The constitution does not provide for the election of a Vice-President upon the death of the President or other cause of vacancy, but the office is filled first by the president of the Senate or failing him, by the president of the Chamber of Deputies. At the beginning of 1919 the President was Dr. Alfredo Baquerizo Moreno who assumed office on Sep. 1, 1916.

EDISON MEDAL. The Board of Directors of the American Institute of Electrical Engineers awarded the Edison Medal for 1919 to W. L. R. Emmet "for inventions and developments of electrical apparatus and prime movers." This was the ninth successive award of this medal.

EDMUNDS, GEORGE FRANKLIN. Former United States Senator, died at Pasadena, Cal., Feb. 27. He was for many years one of the most prominent and highly respected leaders of the Republican party. He was born at Richmond, Vt., Feb. 1, 1828; was educated in the common schools and with private tutors; studied law, and began practice in 1849. From 1854 to 1862 he was a member of the Vermont legislature and from 1862 to 1891 was United States Senator. He was on the Electoral Commission in 1877. One of the many measures for which he is known is the Edmunds Act of Mar. 22, 1882, for the suppression of polygamy in Utah and

the disfranchisement of those who practiced it. He was the author also of the anti-trust law of 1890. In 1880 he received 34 votes for the presidential nomination in the National Republican Convention. During the presidency of General Arthur he was president pro tem of the Senate. For several years he was the leader on the Republican side. In 1884 he received 93 votes for the Presidential nomination. In 1897 he was made chairman of the Monetary Commission, appointed by the Indianapolis Monetary Conference. He was regarded as one of the ablest constitutional lawyers of the time.

EDUCATION. See sections so entitled in articles on foreign countries and States of the United States; also AGRICULTURAL EDUCATION, EDUCATION IN THE UNITED STATES, LITERATURE, ENGLISH AND AMERICAN, and UNIVERSITIES AND COLLEGES.

EDUCATION IN THE UNITED STATES. STATISTICS OF ATTENDANCE IN ELEMENTARY AND SECONDARY SCHOOLS.

AMERICANIZATION. Great importance is attached to the fact that almost without exception the teachers in the public schools of the United States have been beyond the suspicion of disloyalty. It may be assumed, therefore, that the schools have been true to their mission and that those of our youth who are in these institutions have been impressed with the ideals and aims of our Democracy. Throughout the year the problem of reaching those who were beyond the influence of the school in order that they may be taught has received increasing attention. The legislatures in a considerable number of States considered the matter and enacted laws that will serve to bring all foreign language speaking people under the instruction of competent teachers. Congress has had before it several measures that look toward the same end. Following its investigation of conditions in the steel strike district, the Senate Committee on Education and Labor presented a bill which is known as "The Kenyon Bill." In supporting the bill the committee called attention to the fact that there are over 8,000,000 people in this country over 10 years of age who can neither read, write, nor speak the English language, and that at least 55 per cent of this number are native born. Such persons it is urged do not understand the purposes of America. They are, therefore, an easy prey to those who desire to overthrow this government.

The teaching of the American language would be a long step toward ridding the country of these undesirable characters and bringing the light of intelligence to those who are at present deprived of the chance to know and appreciate the opportunities that this country has to offer to them. The bill provides that the Secretary of the Interior, through the Bureau of Education, may cooperate with the several States in the education of illiterates and other persons unable to understand, speak, read or write the English language. There is to be an appropriation of \$5,000,000 for the first year and for each year thereafter until the year beginning July 1, 1923, when the sum of \$12,500,000 and certain additional amounts are to be available. The bill stipulates that the State must appropriate of its own funds an amount equal to that allotted to the State by the United States. No Federal funds can be granted to any

State until the State requires all residents, who are citizens of the United States, 16 years of age or over and under 21 years of age, and all residents of more than six months who are aliens 16 years of age or over and under 45 years of age, who are illiterates or unable to understand, speak, read or write the English language, to attend classes of instruction for not less than 200 hours per annum until they have completed a specified course approved by the Secretary of the Interior.

The money appropriated by the United States cannot be used for any purpose other than the payment of salaries of teachers, supervisors or directors of education or for the preparation of teachers, supervisors and directors of education. The funds are to be appropriated to the States in proportion to the number of persons who are illiterates or who are unable to speak, read, or write the English language, 16 years of age and over. The provisions of this bill are so similar to those that have been constantly urged upon the Congress that it seems probable that some measure of this nature will eventually become a law. Meanwhile many of the States have given the use of the English language in school for the purposes of instruction and administration very careful consideration. Among the States during the past two years that have enacted laws requiring that all instruction shall be in the English language are the following: Delaware, Idaho, Illinois, Indiana, Iowa, Louisiana, Maine, Minnesota, New Hampshire, New York, North Dakota, Oklahoma, Oregon, South Dakota, West Virginia and Wisconsin. The law enacted by the legislature of Illinois departs from the usual form and presents the following statement: "Because the English language is the common as well as the official language of our country, and because it is essential to good citizenship that each citizen shall have or speedily acquire, as his natural tongue, the language in which the laws of the land, the decrees of the courts, and the proclamations and pronouncements of its officials are made, and shall easily and naturally think in the language in which the obligations of his citizenship are defined, the instruction in the elementary branches of education in all schools in Illinois shall be in the English language."

REHABILITATION OF DISABLED SOLDIERS. The vocational rehabilitation act as amended July 11, 1919, provided that "every person enlisted, enrolled, drafted, inducted, or appointed in the military or naval forces of the United States, including members of training camps authorized by law, who, since Apr. 7, 1917, has resigned or has been discharged or furloughed therefrom under honorable conditions, having a disability incurred, increased, or aggravated while a member of such forces, or later developing a disability traceable in the opinion of the board to service with such forces, and, who, in the opinion of the Federal Board for Vocational Education, is in need of vocational rehabilitation to overcome the handicap of such disability, shall be furnished by the said board, where vocational rehabilitation is feasible, such course of vocational rehabilitation as the board shall prescribe and provide."

It has also provided "that the courses of vocational rehabilitation provided for under the act shall, as far as practicable and under such conditions as the board may prescribe, be made

available without cost for instruction for the benefit of any person who is disabled under circumstances entitling him, after discharge from the military or naval forces of the United States, to compensation under Article III of the said act and who is not included in section 2 thereof."

In announcing this method of procedure the Federal Board of Vocational Education stated that "the discharged soldier, sailor, or marine who applies for reeducation under the vocational rehabilitation law is treated throughout by the Federal Board for Vocational Education as a civilian needing advice and assistance; his choice of an occupation is approved, unless after careful investigation, sound opinion shows it to be in the end not advisable; he is trained to meet the needs of the occupation he has elected; he is urged to make the most of his opportunity to overcome his handicap by taking the best available instruction; he is assisted in securing desirable permanent employment when his training course is completed; and he is followed up after he goes to work until it is assured that his employment is satisfactory."

In order to be eligible for vocational training the disabled soldier, sailor or marine must meet the following conditions: "(a) He must have been separated from the military or naval forces of the United States under honorable conditions since Apr. 7, 1917. (b) He must have a disability that was incurred, increased, or aggravated while a member of such forces, or that is traceable, in the opinion of the board, to service with such forces. (c) His disability must, in the opinion of the Federal Board, be of such a nature as to cause him to be in need of vocational rehabilitation to overcome the handicap of such disability. (d) His physical and mental condition must be such as to make vocational rehabilitation feasible."

During the period of training men receive monthly payments for their maintenance. The amount of these payments vary from \$80 for a single man without dependents to \$150 for a man with wife and six or more children.

On Nov. 22, 1919, 18,239 men were receiving vocational training. These were divided into five groups. Group I consisted of those who were receiving pre-vocational training. In this group there were 2923. Group II consisted of those who were receiving instruction in trades and industries. This was the largest group and numbered 5079. The mechanical trades were most popular and of the 2128 enrolled in this department, 651 were preparing to become auto mechanics. The third group consisted of those preparing for business and commercial training and numbered 4839. The fourth group was composed of those receiving training in agriculture. Of these there were 2805 of whom 2131 were preparing for general agriculture. The fifth group is composed of those preparing for the professions. There were 2593 such students. Nine hundred and fifty-seven of these were preparing for some form of engineering, 598 were following medical subjects, 352 studying law, while 80 were following general college courses.

It has been the policy of the Federal Board of Vocational Education to use established institutions. The board is cooperating with 546 State and local institutions and 198 factories, shops and offices. In addition there are co-operative arrangements with government departments, the American Red Cross and American

Federation of Labor, the United States Chamber of Commerce and other like organizations.

TEACHERS. The most important question relating to public education is concerned with the supply and character of the teachers. During the past several years the supply of teachers has been greatly decreased. The best available information indicates that in September, 1919, there were no less than 39,000 vacancies and more than 65,000 teachers who were below standard. At the same time the attendance at normal and teacher training schools was fully 20 per cent below that of 1916. It appears that 143,000 gave up teaching during the past year. This is a loss of about 22 per cent of the teaching population. This matter has now reached such proportions that it has become a great National problem. There is, however, no National policy respecting it and the situation grows worse and worse.

As might be expected there is a disturbing amount of unrest and dissatisfaction among the teaching body. Although this manifests itself most clearly in the numbers that are leaving the profession, it is also manifest in the attitude of those who remain. It seems evident that the first step in the solution of the problem requires that teachers receive a considerable increase in their salaries. Unless such increases are supplied it is reasonably certain that the country will suffer a continued loss of teachers and that promising young persons will fail to enter the teacher training institutions. At present no reliable data are available in reference to teachers' salaries. Some conception of what the situation must be can be gained from the fact that one of the most progressive Eastern States is endeavoring to secure a salary schedule in which \$1200 will be the minimum. In still another State a minimum of \$800 was deemed too high. Every investigation that has been reported shows that the salaries of teachers, even those employed in the high schools, is on the average less than the union scale of wages for most of the occupations.

Except in one or two places there has been no strike of teachers and there are abundant reasons to believe that no further strikes will occur, but in every part of the country teachers are organizing for the purpose of pressing their claims for higher salaries and also for the purpose of securing proper recognition in the professional management of the schools.

AMERICAN FEDERATION OF TEACHERS. In approximately 100 cities the local teachers' associations have joined the American Federation of Teachers, which is affiliated with the American Federation of Labor. One of the high officers of the American Federation of Teachers states, "We are a national, professional, organization of classroom teachers, running our own affairs without any interference of any kind. In common with the National Federation of Federal Employees, Postoffice Employees, Letter Carriers, etc., we do not use the method of the strike, and it is impossible for any local or state central labor body or for the American Federation of Labor itself to urge that method upon us."

Sentiment has been divided in reference to the most desirable form of teachers' union. Many of the leaders in education insist that any organization of teachers must be professional in nature and independent. They urge

that this position is taken, not because they fail to respect the American Federation of Labor, but because they believe it would be a mistake, both for the teachers and for the Federation of Labor.

Dean James E. Russell in a speech before the students of the summer school of Columbia University enumerated as the principles that should govern teachers' organizations, the five points: "I. Every teacher in the organization must be 100 per cent American. II. The work of the teacher must be professional in character and honestly performed. III. The teacher, as a faithful servant, is worthy of his hire. IV. The organization must be honest and straightforward in its dealings with the public. V. The organization should cooperate with every other group of citizens for the promotion of the public good, but should avoid entangling alliances with any one."

TEACHERS' COUNCIL. The past year has brought increased attention to the importance of the teachers participation in many of the professional matters relating to the schools. Prior to 1919, seven or eight of the larger cities in the United States recognized the advice of teachers in the administration of the schools. During 1919 the Board of Education of Washington, D. C., and of several other cities adopted resolutions authorizing the formation of teachers' councils. This action in Washington was the result of an investigation conducted by the teachers of that city which ended in a request on the part of the teachers. This request defines "the teachers' council as an advisory body of teachers called to confer with the superintendent. It enumerates as among the questions to be discussed by the teachers' council changes in courses of study and textbooks, sanitation of buildings, discipline of pupils, salary increases and schedules, and substitute service; and it suggests that for discussion of subjects like these the teacher members of a council bring first-hand knowledge and experience that are invaluable."

The Commission on the Emergency in Education appointed by the National Education Association has urged upon school officials the importance of participation of class room teachers in determining educational policies. The statement of this committee is having marked influence throughout the country. The following is substantiating their statement: "In the administration of the public schools we recognize boards of education as the representatives of the people. There is the responsibility to adopt the policies which will make for the development of public education and through public education for the development of our democratic society. We recognize the superintendent of schools as the executive officer chosen by the board of education to carry out its policies and to recommend to these representatives of the people the kind of action that will make for the realization of our educational ideals. At the same time, we know that teachers working in the classrooms of our public schools have contributed ideas that have had a determining influence upon educational progress. Through teachers' councils, through committees, through voluntary associations, and through individual recommendations, teachers have concerned themselves with the larger problems of educational administration to the great benefit of the schools.

"Boards of education and administrative officers in those communities that have made the greatest progress, have recognized this principle. In many places, by rule of the board or by invitation of the superintendent, teachers' organizations have been requested to make recommendations affecting courses of study, the adoption of textbooks, types of building and equipment, the organization of special classes and special kinds of schools, and the formulation of budgets.

"We believe that participation by teachers is indispensable to the best development of the public schools. We believe that such participation should be the right and responsibility of every teacher. To this end we urge that boards of education by their rules recognize this right, and provide stated meetings at which teachers will be heard. In order to guarantee such participation, we urge state legislatures—the final authorities through whose action local boards of education exercise the control now vested in them—to enact laws providing that teachers may appear before boards of education, providing that these boards shall give them an opportunity to present their suggestions and proposals for improving the work of the schools.

"If these steps are taken not only will the insight, knowledge, and skill of every teacher be made available for the promotion of educational progress, but the responsibility and influence of the classroom teacher will be officially recognized, the calling will become thereby more dignified and attractive, and large numbers of the strong and capable young men and women of the country will enter public school service as a life career. Next to the provision of better salaries for teachers, nothing will do more to raise the status of the profession and make its service attractive to the kind of men and women that the schools need, than the adoption of a policy that will lift the classroom teacher above the level of a mere routine worker carrying out in a mechanical fashion plans and policies that are handed down from above.

"In recognition of the principles of democracy in public-school service, there must be added to the wisdom of the boards of education and to the judgment and executive ability of their administrative officers the effective participation of classroom teachers in the development of the policies which control education."

FEDERAL BOARD OF VOCATIONAL EDUCATION. For the school year ending June 30, 1919, the Federal Board of Vocational Education reports a total of 2039 schools of all types as having received reimbursement from Federal funds on account of vocational courses. This was an increase of 298 schools over the previous year. The total amount of Federal funds was \$1,136,519.01. Eight hundred and sixty-three of the schools were agricultural. These institutions received \$526,122.43 of Federal funds. Among the trade and industrial schools the evening course was the most popular, being given in 325 schools, while 83 schools gave part-time trade and industrial education and 167 gave all-day instruction. Vocational courses in home economics were given for evening students in 127 schools, for part-time students in 27 schools and for all-day students in 309 schools. Schools of one or more types are found in every State in the Union. The largest number is found in

the East Central States. The Southern and East Central report 557 of the 863 agricultural schools. New York, however, has the largest number of agricultural schools for any single State.

EDWARDS, MATILDA BETHAM. British author, died at Hastings, England, January 4th. She was born at Suffolk, England, and wrote extensively on aspects of French life with which she was familiar. A list of her writings includes the following: *The White House by the Sea*; *Kitty*; *Dr. Jacob*; *John and I*; *France of To-day*; *Poems*; *The Golden Bee* (ballads), (1896); *Reminiscences*; *A Romance of Dijon*; *The Lord of the Harvest*; *Anglo-French Reminiscences*, (1889); *A Suffolk Courtship* (1900); *Mock Beggars' Hall* (1901); *East of Paris* (1902); *Barham Brockleband, M. D.* (1904); *Home Life in France* (1905); *Literary Rambles in France* (1907); *Poems* (1907); *French Men, Women and Books* (1910); *In French Africa*, (1913); *Hearts of Alsace* (1916).

EDWARDS, VINAL N. American biologist, died in April, 1919. He was one of the best-known workers at Woods Hole during the summer. He was born in 1859 (?). He was self-educated and not extensively known outside of the scientific world but was highly regarded for his work as a collector of new species.

EGAN, PATRICK. Irish American politician and one of the founders of the Home Rule movement in Ireland, died September 30th, in New York City. He was born in County Longford, Aug. 13, 1841, and after beginning work as a bookkeeper became the head of an important flour and grain business in Dublin. He was strongly Nationalist in sympathy and was active in the formation of the new Home Rule party, and also in that of Irish Land League, of which he was one of the trustees in 1879. He was involved in the accusation against Parnell and in 1880 was tried for sedition and conspiracy in Dublin. After his acquittal he passed two years in Paris and in 1883 came to the United States and settled in Nebraska. He was president of the Irish National League of America from 1884 to 1886. In American politics he was active as a Republican and headed the delegation from Nebraska to the Republican National Convention of 1888. Meanwhile, though not yet a citizen, he had been a strong supporter of Blaine in the campaign of 1884. In 1889 he was made minister to Chile where he incurred criticism for his support of Balmaceda. During the campaigns of 1896 and 1900 he went over to the free silver cause and campaigned for Bryan.

EGYPT. A British protectorate in north-eastern Africa. In December, 1914, it was a khedivate under British control, but nominally under the suzerainty of Turkey. However, in that month, it was declared a British protectorate. Capital, Cairo.

AREA AND POPULATION. The total area of Egypt, including the Libyan desert, the region between the Nile and the Red Sea, the Sinai peninsula, and exclusive of Sudan, is about 350,000 square miles. The Nile valley and delta, the cultivated and settled area, covers 12,226 square miles. The Nile surface, marshes and lakes cover 2850 square miles. To facilitate government, it has been divided into five governorships of the chief towns and 14 provinces, of which six comprise Lower Egypt and eight,

Upper Egypt. The population, according to the census of March, 1917, gave a total of 12,710,120, or a population per square mile of 1057, exclusive of nomad Bedouins. For details of the distribution of this population, see the previous YEAR BOOK. The population of Cairo in 1917 was 790,939; Alexandria, 444,617; Port Said, including Ismailia, 91,090; Suez, 30,996; Damietta, 30,984; Tanta, 74,195; Mansura, 49,238; Zagazig, 41,741; Damanhûr, 40,000; Benha, 18,607; Shibin-el-Kôm, 25,414; Asyût, 51,000; Aswân, 11,293; Beni Suêf, 31,986; Faiyûm, 44,400; Sohâg, 22,000; Giza, 18,714; Qena, 23,357; Minya, 35,000.

EDUCATION. The Maktabs, or elementary vernacular schools, which are under the direction of the Ministry of Education or provincial council, provide elementary instruction. There were 3612 Maktabs in 1917, with an attendance of 200,754 boys and 28,028 girls, making a total of 228,782, and 7233 teachers. These received a government aid of 22,247 pounds (Egyptian). This government aid is made contingent on the teaching of reading, writing and arithmetic, apart from any religious teaching, and upon the school's reaching a satisfactory level of efficiency. There are, besides the Maktabs, higher elementary schools, elementary training colleges for teachers, industrial, agricultural and commercial schools, and higher primary schools. These numbered in all, in 1918, 3733, with a total attendance of 242,025. Under the government departments are a school of law, military school, veterinary school, a higher and intermediate school of agriculture, a school for cadets, and a police school. The chief Moslem university of the world, Azhar university at Cairo, provides an opportunity for higher native education. At Cairo there is also maintained a national university under Egyptian management. It is estimated from the latest available statistics that the distribution of population according to religious faith was 91.84 per cent Moslem, 7.81 per cent Christian, .34 per cent Jewish, and .01 per cent others. At the end of 1919 inquiry into the grievances of the natives (see below, *History*) led to some severe criticism of the British administration in respect to its educational policy. It was pointed out that after 40 years of intervention about 92 per cent of the men and 99 per cent of the women could neither read nor write and it was estimated that 20 more years of work would be required to supply Egypt with schools enough and teachers enough to meet the needs of 90 per cent of the boys and 50 per cent of the girls of school age for primary instruction. Some 8000 schools and 30,000 teachers were said to be needed. The British policy had been directed almost exclusively to the support of secondary education and to the maintenance of the few institutions of higher education, such as schools of law, medicine, technical schools, and schools of pedagogy. It was said that not much progress had been made even in this field. It was not possible for a large proportion of the young men who had passed examinations for higher courses to secure admission to an institution of higher education. For example, it was noted that in 1916 out of 619 candidates who had passed the necessary tests only 341 had found places in the institution they desired to enter. The only medical school whose diplomas were recognized abroad was able to provide for

no more than 50 candidates a year, while Egypt required several hundred doctors. Thus many native students were obliged to go abroad to finish their studies and the results were demoralizing. The government had decided to open some secondary schools but there were no real universities in the western sense, nor were there any schools for the study of the languages and archaeology of the East. The personnel of the private schools was said to be ill paid and inefficient. These defects in higher education compelled the natives to seek instruction at the great university of El Azhar which was the centre of Moslem orthodoxy and not only excluded Western institutions but created prejudice against Western thought. For the past 15 years, Egyptians had been demanding a wider use of the Arabic language in teaching. Here arose a difficulty because the Moslem tendency was to use only the language of the Koran in the schools, which is an archaic form of no practical value for the ordinary purposes of modern life. Finally it was said that the Egyptian education budget was lower in proportion than the budget of more backward nations. Thus the Balkan states devoted from 7 to 10 per cent of their revenues to public instruction, while Egypt applied only 2 per cent of hers. The fellah on whom the main burden rested received only a meagre benefit from the results.

AGRICULTURE. Egypt's arable area was placed at 7,932,077 feddans (a feddan equals 1.038 acres) of which 2,663,539 feddans could be cultivated only after reclamation, in 1918. In 1917 there were 8242 foreign land-owners, owning 713,105 feddans. In 1917, the natives owned 4,773,050 feddans, with a total number of land-owners amounting to 1,662,803, making a total area of 5,486,155 feddans owned by 1,671,045 land-holders. Forced labor has been abolished, but in flood time, the inhabitants are still called out to guard or repair the Nile banks, and they are also liable in any emergency. In 1916, 113,000 were called out. The agricultural population in 1918 formed about one-eighth of the whole population. The landless natives are laborers, the relation between employers and employed being mostly hereditary. The agricultural year includes three crops, cereal produce of all kinds being sown in November and harvested in May or June. Cotton, sugar and rice, the principal summer crops, are sown in March and harvested in October and November. Rice, maize, millet, and vegetables are sown in July and gathered in September and October. In lower Egypt, perennial irrigation by means of intersecting canals, finding their source in the Nile, produces cotton, rice, Indian corn, wheat, barley, clover and cucumber. In Upper Egypt the system of navigation is the submersion at high Nile or the basin system, and cereals and vegetables are produced.

Large reservoir works, including a dam at Aswân, a barrage at Esna, a barrage at Asyût, and a barrage at Zifta, had been completed and put into final successful operation in 1919. The original storage capacity of the reservoir was 1,065,000,000 cubic meters. The capacity of the reservoir has been increased to 2,423,000,000 cubic meters by raising the level of the dam 6 meters. Adequate irrigation to a wide area of basin land is assured by the barrage at Esna, even in a year of low Nile. An area of approximately half a million acres has been converted

north of Deirût, from basin to perennial irrigation in the last 10 years. The principal wealth of the country is derived from cotton. The American markets being more or less closed until the end of the war to European centres, the production in Egypt was constantly stimulated. The cotton crop of 1919-20 was estimated in the autumn of 1919 at 6,000,000 qantars (or cantars. See COTTON. In 1917 the area and yield of wheat were 1,116,459 acres and 811,969 tons, respectively; barley, 444,790 acres and 296,071 tons; maize, 1,734,637 acres; millet, 277,137 acres; and rice, 266,449 acres.

A good oil supply for Egypt seems to be assured. Finds of importance have been made at Gensah. Further new fields have been discovered at Hurgada, which have proved to be of singularly regular formation, with a steadily increasing yield, until, according to the most recent 1919 reports, their average monthly yield is over 15,000 tons of crude oil. The Suez refinery had been enlarged and there was every reason to hope that as much oil will shortly be available for internal consumption as can be dealt with by the company's existing facilities. It was stated that, in consequence, most of the public utility companies in Egypt had converted their plants to burn petroleum residue.

COMMERCE. The imports and exports are given in pounds (Egyptian) for 1918. Merchandise: Imports, 51,155,306; exports, 45,370,020. Specie, imports, 611,009; exports, 5500. A table of the principal countries of origin and destination is shown as follows, in pounds (Egyptian):

Countries	Imports from 1918	Exports to 1918
Great Britain	27,077,635	30,342,496
British colonies in the Mediterranean	284,873	436,603
India and Aden	4,094,341	321,924
Australasia	2,475,649	56,237
United States	491,319	4,286,318
China	1,250,242	15,836
Japan	2,533,968	967,664
France	1,834,789	2,063,217
Greece	2,170,668	871,617
Italy	2,414,070	2,410,632
Switzerland	369,754	911,997
Spain	315,516	1,024,171

A table of principal articles of trade, values in pounds (Egyptian) for 1918, follows:

Merchandise	Imports	Exports
Animals and animal food products	2,293,487	375,924
Hides, skins and leather goods	501,454	622,342
Other animal products	195,542	40,055
Cereals, vegetables	1,861,924	3,413,114
Colonial produce	2,110,638	1,246,729
Spirits, oils, etc.	4,737,141	225,639
Rags, paper books	1,658,776	73,567
Wood and coal	5,415,669	50,952
Stone earthenware and glass	730,488	2,408
Coloring materials	580,024	7,097
Chemicals, perfumes, etc.	1,880,438	187,810
Textiles and yarns	22,190,345	38,297,810
Metals and manufactures	2,858,776	71,173
Sundries	1,599,801	23,245
Tobacco	3,100,929	732,155
	51,155,306	45,370,020

* The cotton tissues imported amounted to 13,686,079. The quantity in raw cotton exported was valued at 38,034,476.

The 1918-19 exports of cotton were made up

of 718,309 bales (bale about 750 lbs.) with proportions to various countries of destination as follows:

	Bales		Bales
England	459,774	Dutch E. Indies . .	10
Spain	10,486	Italy	49,328
United States . . .	95,262	Portugal	250
France	78,487	Greece and Syria . .	2,602
Japan	22,160		
		Total	718,309

The values of the exports of hides and skins from Egypt to all other countries and the United States for 1917, were: United States, \$125,465; all other countries, \$3,813,588. In 1919 the production of woolen sheepskins was about 150 pieces. The annual production of Behara skins was about 200,000 pieces in 1919. The Behara skins are used mostly by the local tanners for the production of Basils, which in turn are chiefly exported, the largest part going to the London market. The annual output of Egyptian lambskins approximates 100,000 pieces. Before the war, Egyptian lambskins were largely exported to Austria via Trieste. Upper Egypt produces the larger amount of goatskins, the annual output of which is approximately 450,000 to 500,000. Buffalo calfskins are likewise an Upper Egypt product, about 250,000 pieces making up the annual output. A large portion of these is exported. Camels are perennially slaughtered in Egypt. The annual output approximates 100,000 pieces. Exports from the Sudan for 1916 are given as 750 tons of hides. The large demand for Arabian hides is met through Egypt and the Sudan, which act as re-exporting centres.

Local consumption in the interior	36,392

Exports of ground nuts from Egypt during 1918 and of ground nuts and sesame during the five months ending May 31, 1919, were as follows: 1083 metric tons, valued at \$194,064, constituting the export of ground nuts from Egypt during 1918, and 261 metric tons, valued at \$41,777, being the exports for five months ending May 31, 1919. The exports of sesame for these same months were 465 metric tons, valued at \$134,727.

INDUSTRIAL CONDITIONS. An important change was effected in August, 1919, when the government monopolies over the purchase and sale of cotton-seed and cotton-seed products came to an end. Business was reported as improving in 1919. Activity was shown especially in the repair and restoration of property that had been neglected during the war. As to industrial conditions generally there was a tendency to organize trade unions in almost all branches of economic life and many strikes were reported including dock laborers and the street railway employees. The increase in the cost of living in 1919 over 1914 may be illustrated by the following items: Mutton, 1914, per oke, 50 cts., in 1919, \$1.50; veal, \$40 and \$1; butter, \$.50 and \$.25; frying oil, \$.25 and \$2; milk, \$.075 and \$.25.

FINANCE. The final accounts for the year 1917-18, April 1st to March 31st, and the budget estimates for the year 1918-19 are as follows in the *Statesman's Year Book*:

Receipts	1917-1918	1918-19	Expenditure	1917-1918	1918-19

Arrivals	809,384
Total	817,881

The debt and charge on guaranteed loans, privileged debt and unified debt in April, 1918, were as follows: Debt, £93,565,740; charge £ (E.) 3,552,266. On Apr. 1, 1918, the debt stood at £93,565,740, inclusive of the amount of £5,370,520 held by the government, and the Caisse de la Dette Publique. In 1917-18 the debt was

reduced by £175,200. The charges on accounts of debts of all kinds, including tribute, as shown in the estimates for 1918-19 amount to £ (E.) 4,605,164. In 1888 and 1890, reserve funds were established, the balances of which were placed at the disposal of the Egyptian government in 1905, less certain sums remaining in the hands of the Caisse de la Dette Publique for the service of the debt. This amount was deposited to the account of a General Reserve Fund. In this fund on Apr. 1, 1918, there was a balance of £ (E.) 8,155,436, including £ (E.) 1,385,257, realized from the minting of new coinage.

DISORDERS AND GRIEVANCES. The grievances enumerated by the Egyptians in 1918 and 1919 included the following charges: Cruel treatment of native soldiers, prohibition of the meetings of the legislature during the war, harsh censorship of news and opinions, suppression of native newspapers and political discussion in the state schools, exclusion from Egypt of any one suspected of being nationalistic and the arrest of national leaders who wished to represent Egypt at Paris. During the closing months of 1918 and early in 1919 these and other causes led to a widespread spirit of disorder, and in March to virtual insurrection. The police were called upon to clear the streets of riotous mobs in Cairo March 10th. This outbreak occurred after it was learned that several of the nationalist leaders had been arrested. Many students in the higher schools were involved in the riot, the movement having begun in the lower schools. They made demonstrations before the government buildings on behalf of the arrested leaders. The police were reinforced by British troops and some shots were fired upon the mob, killing and wounding several. It was necessary again to fire upon the mob on the following day in order to disperse it. Hostile demonstrations took place at Tantah, 50 miles north of Cairo, where 11 persons were killed and 51 wounded. According to reports published on March 13th the number of killed in Cairo was placed at 6, and the number of wounded at 31. The British press reported that telegraphic communications both with Upper and Lower Egypt had been broken in many places and that there had been a widespread attack on the railways. There was great activity on the part of the independence party at Cairo which insisted that the British were depriving the Egyptians of certain government positions to which they had a right and instanced the alleged policy of training the men of the expeditionary forces in government workshops as a means of fitting them for finding employment when they returned to England. At that time martial law was enforced throughout the country and the British government gave it to be understood that no conciliation would be undertaken until the disorders had ceased. Rioting was reported on March 20th when demonstrations took place at Alexandria and at several places in the Delta, but the military authorities were reported to have taken all the necessary measures. A few days later it was learned that the disorders were spreading far and wide, that Arabs had invaded from the west and that the insurgents were resorting to terrorism.

One feature of the uprisings was the siege of Assiut where at the end of March a small British detachment held out against bands of Bedouin and fellaheen numbering about 3000. At the same time some 900 convicts attempted to escape

from jail. According to reports the defense was a gallant one. The town was relieved by boats sent down from Cairo.

GENERAL ALLENBY MADE HIGH COMMISSIONER. On March 22d it was announced that General Allenby had been appointed Special High Commissioner for Egypt with full military and civil powers and was entrusted with the task of restoring order and taking all necessary measures for upholding Great Britain's authority as a protecting power. He arrived at Alexandria March 25th and at that time the conditions were reported to be improving. The nature of the movement as described in correspondence to the *London Times*, at that time, may be briefly summarized as follows: It was already seen in February that serious trouble would follow the departure of the High Commissioner Sir Reginald Wingate because the Nationalists would regard it as a triumph of their leader, Prime Minister Rushdi Pasha. In two years this was the second time that the High Commissioner had suddenly left the country. In December, 1916, the High Commissioner returned and his place was taken by another officer and it was interpreted having been done in obedience to the wish of this same Prime Minister Rushdi. Over a year before a plot had been discovered and four Pashas were arrested without taking any measures of safety and it was argued that if precautionary measures had been taken the disturbances would never have occurred. The English should have encouraged the conservative element. This element largely centered around the ownership of cotton lands. The great cotton-growers had no sympathy with the Nationalist party. Then there were the agricultural interests, the army, the clergy, and the traders in Cairo, all of whom might have been united against the groups that aimed at revolution. These groups according to the *Times* correspondent consisted of the idle classes who were first, the poorer class of clerks and the street arabs in the towns; secondly the lawless natives of the western banks of the Nile; third, the Bedouin people of the cultivated territory in Fayoum and elsewhere. The native population had greatly increased as a result of the British sanitary methods and there was a large number of unemployed young men in the towns. They belonged to the class that could not become agricultural and they seemed unsuited to commerce in which the Jews or Greeks showed greater ability. They were easy victims of agitation and popular delusion. This was a serious element of danger in all large towns. Along with them might be classed the thousands of street arabs, shoe-blacks, newsboys, etc. The disorderly tribes of the interior had always constituted a danger. They lived in the wilder parts of the country along the banks of the Nile, especially in Upper Egypt. As to the Bedouins, they were beggars and vagabonds and constituted a dangerous and worthless element in the population. General Allenby upon his arrival said that he would put down disorders first and then make a careful inquiry into the grievances. On April 5th it was announced that the leading Egyptian notables had issued an appeal to the people to remain calm; but soon afterwards it was learned that the native government officials in Cairo had gone on strike as a protest against Lord Curzon's statement that there was no sympathy on the part of the official class with the revolutionary movement. The strike was ac-

accompanied by demonstrations in the street which resulted in riots and conflicts with the troops. Order was restored but six persons were killed during the uprising. On April 11th it was learned that a new ministry had been set up under Rushdi Pasha who had resigned just before the Nationalist outbreak and who brought back with him the principal members of the last cabinet. At the same time Zaglul Pasha and his three companions who had been deported to Malta and were the subject of much popular sympathy were released. This event was followed by public rejoicings during a period of three days and the occasion was marked by several attacks upon the military resulting in the killing and wounding of several British soldiers. The Sultan issued a proclamation urging the people to maintain public order. One of the first acts of the new ministry was to confer with the Egyptian officials who had gone on strike. Many casualties were caused by the throwing of vitriol and on April 21st it was reported that the Egyptian government had imposed the penalty of death for this offense. At this time there was much intimidation of the native officials and of the employees in the postal and railway services. The political strike was one of the measures taken by the disorderly element. On April 22d conditions were improved but the railways were said to be at a standstill and there were still frequent attempts to intimidate employees. Rushdi Pasha resigned April 23d, and a new ministry was formed under Mahomed Said Pasha, who was described as a disciple of Cromer and Kitchener.

CAUSES OF UNREST. There was no question that the agitation in Egypt involved a large part of the population including the educated classes. Provincial and government officials, members of the bar, students at the colleges as well as the inevitable disorderly element were all involved in it. The chief cause was in the first instance political. The educated Egyptians and the official classes professed to believe that they would be better off if their nation could administer itself and they resented the presence of the British. The more moderate among them favored passive resistance as in India, but they were carried along by the more violent class. The members of the legal profession insisted that the British had the intention of introducing entirely new legislation based on English law and substituting English for the Arabic as the language of the courts. These and other false rumors stirred up public indignation. The speeches and articles among the Allied nations in regard to the rights of peoples gave an impetus to the movement. College students were especially prominent in it and some of the most violent attacks were led by them. There was talk of German influence and money. There was a considerable Coptic element among the revolutionists. The Copts complained that they had not been treated by the British as they should have been treated considering the fact that they were fellow Christians. The railway workmen were offended by the rumor that the British intended to bring in British workingmen after the war. The peasantry or fellahen joined the movement in great numbers, to the surprise of their British rulers for they had been regarded as the most law-abiding of the Egyptians and had always shown respect and even gratitude toward their foreign masters. One of their

grievances was the requisitioning of food and farm animals during the war and their discontent was played upon by the fanatical Moslem element and by the students.

POLITICAL UNREST. In November an appeal was addressed to the President of the United States by the Egyptian leader, Saad Zaglul Pasha, in which the United States was urged not to leave the Egyptian people at the mercy of England. In certain French quarters the situation in Egypt was emphasized as indicating the inferiority of British colonial policy to the French. In respect to Egypt for example, a writer reminded France of the time when her civilization extended to the borders of the Nile, and argued that French prestige had made so many friends for her in Egypt, that but for the short-sightedness of politicians, France to-day might consider Egypt as thoroughly French in spirit as was Syria. The French pointed out that the British control had never resulted in cordial relations between the two races, for the Egyptian character was altogether different from the Anglo-Saxon; it bore more resemblance to the French. While England might grant many benefits she would never reap the good-will or gratitude of the country. She could make slaves of them but not friends. This, said the critics, the English themselves had discovered with regret. After 36 years of British administration, on the whole beneficent, the Egyptians still feared the English and detested them. At the present time forcible measures had to be undertaken to maintain the British protectorate. The French argued that if order could be maintained only by means of machine guns, if troops were obliged to fire upon crowds to prevent their demonstrations, and if, overwhelmed by this wave of nationalization, the British authorities had now to employ the methods of the Germans in order to stifle the agitation of patriots, it was the fault of England herself. In the *White Book* published by the Egyptian delegation at the Peace Conference, England was accused of a series of atrocities that recalled the methods of the Germans. Official reports of Egyptians, and minutely detailed documents, were submitted at the time. In a letter addressed to M. Clemenceau by Zaglul Pasha, June 28, 1919, it was charged that the general in command of the British forces had given the formal order to all the Egyptians, even the highest functionaries, to salute every British officer encountered in the streets; that Egyptian villages had been pillaged and burned, women violated, and men massacred on mere suspicion; and that many natives had been publicly whipped on various pretexts; and photographs were attached to this document and accompanied by medical testimony, showing the physical condition of the alleged victims who were, according to the report, guilty only of patriotism. French commentators were surprised that in the United States so ardent a sympathy was expressed for the wrongs of Ireland, and such complete indifference was shown toward the cause of Egypt; for Ireland, apart from everything else, had done her best to aid the Germans. The United States was criticised for having accepted the kingdom of Hedjaz, and at the same time not expressed a sympathetic word for the Egyptians. Egypt had declared war against Germany in August, 1914, and this was not a merely formal act, for Egypt had furnished men and money in the war. She had

done much voluntarily and yet Great Britain had made requisitions with such brutality as to anger the population. The reward had been to place Egypt without her consent under a formal protectorate in contempt of the solemn promises of British statesmen. Finally after the victory Egypt had taken part along with other small countries in the pilgrimage to Paris to demand national independence. For five months the British authorities refused passports to the Egyptian delegation, regularly chosen by the people. The cabinet having resigned in sign of protest, the British authorities deported to the island of Malta the president of the delegation along with three of his colleagues. When finally the delegation was permitted to go to Paris it found all doors closed to it. Numerous addresses to M. Clemenceau, and letters addressed to President Wilson remained without reply. In fact, Egypt was not permitted to set forth her claims at all. Without any regard to her attitude during the war, without even hearing her authorized representatives, they had obliged Egypt to descend in the national scale to the position of a protectorate. French commentators and other Egyptian sympathizers declared that the principles of justice expressed by President Wilson had been openly violated, and that no excuse on the part of Great Britain could obscure the justice of the Egyptian complaint. Lord Curzon in the House of Lords in November maintained that Egypt was as incapable of protecting her frontiers as of governing herself. While admitting the possibility of this, the Egyptians replied with the question, "How about the Hedjaz? How can one explain the fact that the vilayet of the Hedjaz, which has made no sacrifices during the war comparable to those of Egypt, has obtained its complete independence? How explain the fact that the Hedjaz, an elementary state, with small resources and a scattered population, should be placed in a position politically superior to Egypt, who has so largely and loyally contributed to the victory of the Allies?" The commentators pointed out that the explanation was simple enough in that the Hedjaz was destined to serve as a link between the possessions of Great Britain in Asia and Africa, and therefore it was to the interest of the British policy that this course should be taken; moreover, that the independence of the Hedjaz would be merely nominal. Egypt on the other hand was more dangerous for the very reason that she was stronger. She was one of the gates of Africa, and commanded the route to India and her independence and national strength might be embarrassing to the imperial aims of Great Britain. One of the French commentators hinting at American designs on Mexico remarked: "Who can say that the Egyptian precedent does not serve the aims of certain statesmen whose country has there already to hand some rich territories which would make an admirable Egypt on occasion?" In summing the matter up, they said, the Egyptians regarded the question of national liberty as one to be decided on the principles of right; they pronounced against the British control and they reserved their rights for the future. England was criticised for refusing to hear the protests of the Egyptian representatives, for arbitrarily setting up a protectorate, for adopting a totally different principle in her eastern policy, and for stifling by violence the nationalist sentiment in

Egypt. Toward the end of the year there was a sign that the British government was giving ear to these objections, for there was a plan on foot in England to grant a special constitution to Egypt.

CRITICISM OF BRITISH POLICY. At the end of the year an inquiry was made into the conditions of the country for the purpose of finding to what extent grievances of the natives were well founded and reports published at the time brought out a number of alleged defects in the British administration. In the first place the British were accused of assuming the air of masters and of a lack of tact in dealing with the natives. Egyptians, while admitting that their country needed foreign aid, especially the aid of technical and scientific experts, objected to the irritating and domineering methods frequently employed. It was acknowledged that benefits had followed from the English rule, especially in the protection assured the fellahen against the tyranny of the great landed proprietors, but, along with these benefits there had been a failure to realize that the upper classes of Egypt were growing more and more fit to perform administrative functions. They were not admitted to this service in proportion to their deserts and to their numbers; and their legitimate ambitions in this respect were not satisfied. During the war the measures taken by the government had hurt the pride of the people and aroused suspicion. A new and more generous spirit must prevail in order to regain their good will. This point of view was frankly admitted even in certain English quarters. The Egyptians believed that the promise of giving the natives a fair share in the government had not been fulfilled. The Legislative Assembly created by Lord Kitchener was composed only in part of elected members and it had only advisory power together with the right to veto any increase of taxes. Though created in 1913 it had held only one session and it had not once been called together during the war or since. Formerly the administration had in the main been in native hands; but from year to year these functionaries had been gradually removed and their places taken by officials from the mother country, many of whom were not so well qualified. Besides causing discontent the administration policy had discouraged personal initiative among the natives and the best of them had left government employ. In 1896 it was said that there were only 286 British officials in the service, whereas in 1919 there were 1671. An Egyptian journal declared that among the officials receiving £500 a year only 150 were Egyptians, whereas 475 were British subjects and 99 belonged to divers other races and it complained that positions were created apparently for no other purpose than to provide persons with salaries.

CABINET CRISIS. As results of the disorders in the spring the government decided to send a commission to Egypt under the presidency of Lord Milner. Its members were announced in September and on November 18th its general policy was defined as the working out of a plan for a constitution in consultation with the Sultan and his ministers and with representative Egyptians while carrying out the preliminary work. Toward the end of November a cabinet crisis occurred and there were signs of revolt in the country on account of the refusal of the Moslem element to coöperate with the government un-

til the affairs of Turkey had been settled by the Conference. On November 26th a new ministry was constituted under the premiership of Youssef Wahba Pasha. Several civilians and soldiers had been killed in the riots and General Allenby on November 24th had proclaimed a warning that disorders would be punished under martial law. On November 25th Earl Curzon declared in the House of Commons that the government could not give Egypt entire liberty of action, for it controlled the route into Africa and India and it was not capable either of maintaining stable government or of protecting its own frontiers.

EISNER, KURT. Bavarian revolutionary leader and Prime Minister, assassinated at Munich, according to dispatches of February 21st, by Count Arco Valley of the German army. He was born in Berlin of Jewish parents about 1858 and studied at the University of Marburg where, according to accounts, he acquired a varied culture. He soon interested himself in journalism. From about 1890 to 1895 he was a contributor to the *Frankfurter Zeitung*, and attacked the Emperor in an article which resulted in his passing nine months in prison. He afterwards wrote for the Socialistic press, and was for a time editor-in-chief of *Vorwärts*. A book which he published in 1906 under the title of *The Fall of the Empire* attracted much attention. In 1907 he went to Nuremberg and became the editor-in-chief of the Socialist *Frankischer Tagespost*, and in 1910 he entered on a campaign in the Munich *Post* against Prussia. He was an ardent separatist and constantly attacked the Prussian ascendancy. In April, 1918, he was arrested by the Bavarian government, and the report was circulated that he had tried to commit suicide. Later he was released and took an active part on the radical side in the revolution. But while opposing the majority Socialists, he did not approve of Bolshevism, aiming on the other hand at a democratic revolution which would result in liberating the south German states. In November, 1918, he went so far as to break off relations with the Berlin government. He failed of nomination to the German National Assembly. During the Berne Conference of Socialists, he attacked the majority Socialists on the one hand, and the Bolsheviks on the other. His attitude toward the war was the scandal of a large element in Germany, for he emphatically declared that the Emperor was to blame for having brought on the war, and that the whole military caste of Germany ought to be brought to trial for responsibility for the war. He also declared that the Germans had maltreated their French prisoners of war. Just before his death, after returning from the Berne Congress, he replied to the attacks in the press on what he had said there. He declared that the Germans did not realize how isolated they were from the rest of the world, and what terrible distrust German policy inspired outside of Germany. Germans, he said, take no account of the extent to which the German revolution is regarded abroad as a mere comedy. This, he added, would continue so long as the German leaders should be those who now carry on the odious war policy of Germany. He demanded a complete change of leadership in the government. Count Arco Valley, his assassin, killed him while he was on his way from the foreign office to Parliament, firing two bullets into the back of

his head. The murderer, according to dispatches, was himself mortally wounded by a soldier of the guard. He was a member of a family well known in the United States from the fact that the minister from Germany, 1888-91, bore the same name. The motives of the crime were variously interpreted, but seemed to arise from the fear of the separatist policy of the premier as well as from hatred of his radicalism. It was said that if Eisner had been simply a Socialist the crime would not have occurred, but he meant to organize an independent Bavaria, and this policy had roused a bitter animosity in Berlin.

ELECTRICAL INDUSTRIES. The year 1919 was a period of both readjustment and expansion. In the beginning of the year many large manufacturing companies that had made plans and partially executed them for great expansion of manufacturing facilities were obliged, owing to the signing of the Armistice, either to modify these plans to a great degree or to cancel them altogether. In some cases, however, it was found after a short time that the industrial demand gave promise of overtaking the capacity that had been provided by manufacturers for wartime needs, and by the middle of the year the manufacture of all kinds of electrical apparatus was increasing in quantity at a very rapid rate. The electro-chemical industries were absorbing a large part of this new output, one of the most prominent of these being the application of electric power in steel-making, as mentioned in the 1918 YEAR BOOK.

The quality of the steel produced in electric furnaces not only continued to be highly satisfactory to those who made use of such product, but there was an increasing demand throughout the steel industry for constantly larger installations of electric furnaces. In household appliances there was a veritable boom in demand. The Society of Electrical Development had early in the year laid out an aggressive campaign for the marketing of such goods and the rapid introduction of electric irons, vacuum cleaners, washing machines, and to a limited extent cooking appliances justified the efforts that had been made in the distribution of these articles.

It is almost unnecessary to mention that all electrical goods and supplies were higher in price than ever before. Comparison of such prices during the past year with those prevailing five years earlier as furnished by the *Electrical Review*, Jan. 3, 1920, shows that in a list of about 50 articles, ranging from dry and storage batteries to every kind of wire, increases in price have been on the average from 50 to 100 per cent. It was difficult at the close of the year to give a reliable estimate of the value of articles manufactured that could be fairly classed as for use in the electric industries, but comparisons have been made from figures furnished by the manufacturers. As it is impossible in a limited space to give an even approximately complete list, the prices of a few articles given herewith may prove of interest.

	Manu- factured in the year 1917	Estimated value of the same in 1919
Fans	\$4,700,000	\$8,250,000
Generators	75,475,000	46,875,000
Heating and cooling appar- atus	6,200,000	9,030,000

	<i>Manu- factured in the year 1917</i>	<i>Estimated value of the same in 1919</i>
Insulators, glass and porcelain	4,000,000	10,500,000
Storage batteries	18,000,000	62,500,000
Wire	27,000,000	45,000,000
Wireless apparatus	3,100,000	2,000,000

ELECTRIC LIGHTING. During the early part of the year the after effects of war manifested themselves in the electric lighting industry to a considerable extent. Many central stations that had arranged for the supply of large amounts of power to industrial plants engaged in making munitions were forced by the sudden termination of hostilities in Europe to find a new market for the sale of their energy. This led to an intensive campaign for the further development of industrial and domestic electric lighting. Incidentally, there were several improvements in the efficiency of lamps that were worthy of note. Continuing the tendency of the two preceding years the gas-filled Mazda lamp was replacing arc lamps for street lighting, as well as for the illumination of large public places such as railroad stations, halls, etc. By an improved method of treating the carbons used in flaming-arc lamps a higher degree of efficiency and a whiter light was obtained from the latter and this enabled them to hold their own in some localities for municipal lighting on account of the extreme brightness furnished by them where particular features of display illumination were desired. In industrial plants more attention than ever was given to improved methods of illumination, with the special object of enabling the employees to see their work more clearly and, at the same time to avoid the creation of glare which constituted so bad a feature of poorly designed factory lighting, in so many cases proving injurious to the eyes of the workers. Several States had adopted standard codes for the illumination of factories and workshops, but as with legislation on similar subjects there was a lack of uniformity in the conditions imposed as regards the intensity of illumination or the distribution of the lighting units themselves. It was hoped that the ensuing year would see an improvement in this respect, as the Illuminating Engineering Society was carrying on an active campaign, with the Legislatures of different States on this subject.

Much more attention than formerly was given to better lighting for streets, and there were many opportunities during the year for the installation of display illumination. On the arrival of American troops from France there was a very carefully designed and well executed scheme of decorative lighting put into effect on Fifth Avenue, New York, one of the features of this being a replica of the "arch of jewels" that had been so prominent a feature in the artistic illumination of the Panama-Pacific Exposition at San Francisco in 1915. The daylight saving law was repealed by Congress, but that action did not represent accurately the sentiments of the entire United States, as was evident from the fact that at the close of the year several State Legislatures were considering the reenactment of such a measure. The consensus of opinion was, however, that unless the revival of daylight saving could be made effective over the entire United States, or at least over certain defined regions, the resulting confusion and incon-

venience would make it quite impracticable. A matter to which the Illuminating Engineering Society has given special attention was that of automobile headlights. The intensity, direction, and various other conditions controlling these lights were the subject of extensive legislation and many States had in force regulations regarding these details, but there was only a general agreement between them, while leaving many details still unsettled. The introduction of electric headlights for railway locomotives was carried on at a rapid rate and after the initial prejudice against such lights on the part of enginemen had been overcome, they were found highly satisfactory in service, particularly after means were added for dimming a headlight when one train was approaching another, thus overcoming the difficulties of vision due to the glare of which the enginemen had complained. These locomotive lighting units were largely standardized by the manufacturing companies and consisted of a small turbo-generator, the turbine being operated by steam from the boiler, mounted usually in front of the engine cab and wired to a cut-out block in the cab where the fuses and dimming switches for the headlight as well as those controlling the cab and running lights could be manipulated. See MUNICIPAL OWNERSHIP.

ELECTRIC POWER, TRANSMISSION OF. No notable undertakings in long-distance transmission lines were started during 1919; some construction work was going on, however, on the extension and completion of lines on which work had been started for the distribution of energy to plants originally designed for the production of war munitions and later modified for other forms of output. The interconnection of different transmission lines referred to in the 1918 YEAR BOOK, for the purpose of equalizing the load among several generating systems supplying large areas was extended to a considerable degree. In many instances this had the advantage of allowing an existing steam station to be replaced by a substation fed from some distant hydroelectric plant, thus diminishing the maintenance charges inseparable from steam operation.

On long lines there was an increasing preference shown for synchronous condensers, which were merely synchronous rotary converters for absorbing the surges of voltage due to uneven or irregular loading. Electrical engineers, while giving serious consideration to the practicability of employing alternating current pressures as high as 220,000 volts did not put their ideas to the test of actual practice, the average transmission voltage on long lines remaining at between 100,000 and 150,000 volts. In connection with such lines, outdoor switching stations were increasingly common, and more efficient protective devices gave promise of material reduction in interruptions due to lightning as well as from accidental short circuits.

In Europe, particularly in France, there was a revival of interest in the Thury system of high tension, constant current, transmission employing a series of direct current generators. This had given very satisfactory results in the past on account of the simplicity of the controlling apparatus and comparatively low cost of maintenance. Several long lines to operate on this system were projected, deriving their energy from French water powers.

ELECTRON ARRANGEMENT IN ATOMS. See CHEMISTRY, GENERAL PROGRESS OF.

ELKINS, GEORGE W. American capitalist, died in Philadelphia, Pa., October 24. He made a large fortune in various fields, especially in traction. He was born in Philadelphia, Sept. 26, 1858, and was educated in the public and private schools. Among the many corporations in which he was interested, may be mentioned Philadelphia Traction, Union Traction, Union of Coke and Gas, and the Metropolitan Street Railway of New York City.

ELLYSON, JAMES TAYLOR. Prominent business man and Baptist, died at Richmond, Va., March 18. He was a Confederate veteran and was prominent for many years in the Democratic party of Virginia. He was born at Richmond, Va., May 24, 1847, and graduated at the University of Virginia in 1869. He served in the Civil War and afterwards engaged in business in Richmond where he soon was called to positions of prominence, being State Senator 1885-88 and mayor of Richmond for three terms beginning in 1888. For 25 years he was chairman of the Democratic State committee and he was Lieutenant-Governor of the State, 1916-18. He was for 40 years Executive Officer of the Educational Board of the Baptist General Association of Virginia.

ELON COLLEGE. An institution of learning maintained by the Christians, at Elon College, N. C. In the fall of 1919 there were 400 students and 28 members of the faculty. The library contains 12,000 volumes. The funds of the institution in 1919 were \$528,000. The college was organized in 1889. President, William Allen Harper, Litt.D., LL.D.

EMERY, EDWARD K. Justice of the New York Supreme Court, died at Buffalo, N. Y., November 11. He was born at Aurora, N. Y., July 29, 1851, and studied law at Buffalo where he was admitted to the bar in 1877. He was a member of the Assembly in 1887 and 1888, then appointed to judicial positions, rising to the justiceship of the Supreme Court of New York for the term Jan. 1, 1907, to Jan. 31, 1920. In politics he was a Republican.

ENDE, HERWEGH VON. An American violinist and noted teacher, died in New York, January 15. He was born at Milwaukee, Feb. 16, 1877. In 1910, he established in New York a violin school, which rapidly developed into one of the best known conservatories of the metropolis. He was a son-in-law of Eduard Reményi.

ENGINEERING. With government, industry and commerce the world over, badly disarranged and far from reestablished on a normal basis in 1919, it was not strange that engineering developments during the year should be rather inconspicuous in most fields and in most countries. Just as the engineering professions had been called to take part in the great world war, in the same way they had their part to play in the vast restoration, but the means and

facilities of peace were far more difficult to assemble than those of war, and enforced economies, national, corporate, and individual, hindered construction and initiative. Governments, national, state, and local, were in no position to undertake other than the most necessary public works, and conditions of world finance were far from favorable towards securing funds for national enterprises. Political conditions were unsettled, labor was far from stabilized or contented the world over, and post-war conditions in short were such that great engineering projects could in most cases advance but little beyond the discussion stage. Indeed the economic function of the engineer perhaps was more conspicuous than his designs and construction, and his part in the readjustment was destined to be large. Therefore the reader of the articles in this department in the YEAR BOOK for 1919 will find that the purely engineering is often subordinated to the political and economic, and while serious work may be done looking towards establishing normal conditions it will be found neither conspicuous nor spectacular. This is true for example in the case of BRIDGES (q.v.) where with the exception of a record bascule bridge across the Chicago River few structures of special note were completed or designed. Under AQUEDUCTS (q.v.) there was to be recorded only the beginning of the Schoharie project of the Catskill Aqueduct for New York City, while the most notable DAM (q.v.) perhaps was that for the Hetch-Hetchy Reservoir whose construction was begun in earnest. CANAL (q.v.) construction involved more the discussion of schemes of Internal Waterways both in Europe and the United States, but DOCKS AND HARBORS (q.v.) reflected the commercial activity set on foot by the war seen in the completion of some large graving docks and future plans to provide harbors adequate for the great world trade which seemed bound to ensue. FLOOD PROTECTION (q.v.) was a field where distinct progress was made in the United States. TUNNEL (q.v.) construction received an impulse in the active prosecution of the plan for a vehicular tunnel under the Hudson River between New York City and New Jersey. RAPID TRANSIT (q.v.) was still a vexed question during 1919, not on the side of engineering in the way of design and construction, but rather in the way of operation with advancing labor and other costs and political and economic elements, too often hopelessly and unintelligently combined, confused, and predominant. In SHIPBUILDING (q.v.) the vast quantity production that the war stimulated was beginning to be apparent and this rather than novelties of design was the outstanding feature. In MILITARY PROGRESS and NAVAL PROGRESS may be appreciated how engineers had some opportunity to consider the functioning of the various machines and methods that were hastily turned out during the war and their future availability for military or peace purposes. In electrical engineering there were no special developments save in some special machines discussed under DYNAMO ELECTRIC MACHINERY and RAILWAYS, ELECTRIC (qq.v.) the electric locomotive however undergoing some important modifications during the year as its increased use was clearly indicated. Railway construction and operation was an important question but figured rather in the realm of politics and economics than in engineering. In the United States and Canada lit-

the construction was done (see RAILWAYS) though railway control and operation were live topics. In Europe reconstruction figured along with difficulty of materials and rolling stock.

WORK OF THE ENGINEERING COUNCIL. This important American body of engineers first organized in June, 1917, was particularly active in 1919. During the war it had furnished to the United States government the names of 4000 engineers available for war service and with the conclusion of hostilities and the return of the troops it registered 5000 engineers and assistants for whom it sought to secure positions without cost to the registrants. It assisted in various ways, consulting and advisory in legislation and administrative developments and in advocating governmental efficiency. The council on Jan. 1, 1919, opened a Washington office in charge of M. O. Leighton, chairman, National Service Committee, which was useful in affording a varied service to engineers, especially in supplying information concerning congressional and department activities, also useful to government.

Under the auspices of the council there was assembled in Chicago, in April, 1919, a conference of 74 technical organizations having 105,000 members. This conference, permanently organized, drafted the Jones-Reavis Bill, and throughout the year was actively advocating its passage. This bill provided for the establishment of a National Department of Public Works, by modification of existing departments and is discussed in a subsequent paragraph.

As a result of an appeal to the President by the Engineering Council there were held conferences of the 14 government offices engaged in map-making, with prospects of greatly accelerating the completion of the topographical map of the United States. The proper compensation of engineers was a topic of general discussion during the year and the Engineering Council aided in securing increases of pay for railway technical engineers.

It also established a Committee on Classification and Compensation of Engineers, with sections on railroads, federal government, and municipal and State governments, and at the end of the year reported considerable progress. This committee was working with Congressional Joint Commission on Reclassification of Salaries.

The council aided in reinstatement of 350 engineers unfairly dismissed by City of New York, organized a Committee on Types of Government Contracts, and drafted a typical general law for registration of engineers.

Another evidence of activity was a request of the President to appoint engineer members of the Interstate Commerce Commission and of the International Joint Commission. Finally in a summary of activities of the Engineering Council these items are mentioned:

It assisted the State of New York in preparing a scheme for reorganization of State government.

It was engaged in studying curricula of engineering schools, making suggestions as opportunity offers.

It joined with National Research Council in a report on improvement of the patent system and practice, on which legislation has been based.

It participated in organizing the National

Board for Jurisdictional Awards in the Building Industry and has a member thereon.

On invitation of the House of Representatives committee, the Engineering Council sent delegates to present testimony on a national budget.

The Engineering Council in 1919 had 40 general correspondents and 27 correspondents of its Water Conservation Committee, distributed throughout the country. It had 22 committees, of whose 125 members 72 live at a distance from New York.

A PROPOSED DEPARTMENT OF PUBLIC WORKS. During the year 1919 Senator Jones, of Washington, and Representative Reavis, of Nebraska, introduced bills providing for a Federal Department of Public Works to take the place of the Department of the Interior and have charge of all the engineering activities of the United States Government. The bureaus of the Interior Department which were not concerned with engineering were to be placed under the jurisdiction of appropriate departments, while engineering bureaus from such departments were to be included in the new Department of Public Works.

The proposed new department would include the Supervising Architect's office of the Treasury; the Construction Division, River and Harbor Improvements, the Mississippi River Commission, and California Débris Commission of the War Department; the Bureau of Standards and the Coast and Geodetic Survey of the Department of Commerce; the Bureau of Public Roads and the Forest Service of the Department of Agriculture. At the same time the Patent Office was to be removed from the Interior Department and placed under the Department of Commerce. The Bureau of Pensions was to be assigned to the Treasury Department and the Bureau of Education to the Labor Department. The Bureau of Indian Affairs was to be transferred to the Department of Labor, with the proviso that the engineering and construction work and the land and mineral surveys performed under the direction of the Bureau of Indian Affairs should be prosecuted under the Department of Public Works. Other minor branches of the Interior Department go under different cabinet offices.

The bill provided that the new Secretary of Public Works "shall by training and experience be qualified to administer the affairs of the department and to evaluate the technical principles and operations involved in the work thereof." Four assistant secretaries, each to be paid \$7500 per annum, were provided for in the bill. One of these was to have jurisdiction over matters of engineering design, and construction; another over architectural design and construction; a third over all scientific work and surveys, while the fourth was to be in charge of land and naval matters.

The bill also provided that engineer officers of the United States army detailed on non-military work were to be assigned by the Secretary of War to like duties under the new departments for not over two years, and members of the Corps of Engineers may under the direction of the Secretary of Public Works be detailed by the Secretary of War to temporary duty in the new department for such instruction, training, and experience as may be desired.

Engineers throughout the country were very much interested in the Jones-Reavis bill and various technical organizations and Chambers of

Commerce in which engineers exercised influence passed resolutions endorsing the measure.

During the year the American Association of Engineers was formed and established national headquarters in Chicago. This association is not a technical organization, but one which promotes the social and economic welfare of professional engineers.

The engineering services of the United States government suffered considerable depletion during the year as a result of inadequate compensation, and in the United States Geological Survey 17 per cent of the scientific force resigned, according to the report of the Director. The average salary of 29 geologists who had left the Survey to enter private employment was \$2271, and the average initial salary of these men in their new private employment was \$5,121. After two years' service, this compensation averaged \$7804, and eight of the geologists were receiving \$10,000 or more in private positions. This condition was particularly serious, in view of the universal demand for the completion of mapping of the country, of which nearly 60 per cent of the area is totally unmapped. The estimated cost of this work was \$40,000,000, including the cost of revising the older survey. To carry on the work expeditiously and efficiently involved an organization of specially trained engineers, and Dr. Smith estimated that beginning with the field season in 1919, several hundred thousand dollars should be appropriated, which would reach a maximum of \$4,500,000 in 1928. Under such conditions the field surveys of the entire United States could be economically and effectively executed and the work completed in 1932.

LICENSING OF BRITISH CIVIL ENGINEERS. In July a proposal was placed before the Institution of Civil Engineers of Great Britain that steps should be taken to establish and regulate by law the registration for the civil engineering profession. The members voted approval of this proposition, and the Council was directed to introduce a bill into Parliament to attain this object. The principal provisions of the proposed bill were to be a definition of the term "civil engineering," and the creation of a register which would contain all corporate members of the Institution of Civil Engineers and of the Institution of Civil Engineers of Ireland, and also other persons engaged as civil engineers and members of important engineering societies or who had engaged in civil engineering practice for a substantial period. It was further proposed that the eligibility of individuals in the latter class be established and a high professional standard maintained.

Throughout the war there was a close contact between English and French engineers, and the members of the Société des Ingénieurs Civils de France during the year formed a British section to meet periodically in London. This new organization was to improve the relations between English and French engineers and scientists, and to further the kindly feeling and coöperation which was maintained between the engineers of the two countries during the war. It was proposed that the London section should endeavor to keep English and French societies of engineers in touch with each other, and even make arrangements for the exchange of engineering students between engineering firms of both countries. It was believed that matters of common interest, such as the Channel tunnel, the relation of the

shortage of coal to hydro-electric development in France, and other matters could be thoroughly discussed at the association's meetings in London.

ENGLAND. The term England, when used in referring to the government, is sometimes used for the United Kingdom of Great Britain and Ireland. England proper is the largest and most densely populated portion of the United Kingdom. See GREAT BRITAIN.

ENGLAND, CHURCH OF. This is the established church of England and Wales, and is represented by the Protestant Episcopal Church in the United States. In 1914 the church was disestablished in Wales and Monmouthshire by act of Parliament, but the process was deferred until after the war. So far active steps have not been taken. The King of England is the supreme governor of the church with the right to fill vacant archbishoprics and bishoprics. Many deaneries, prebendaries, and canonries are under the appointment of the First Lord of the Treasury, and a large number of livings and some canonries are in the gift of the Lord Chancellor. For administrative purposes the country is divided into two provinces, Canterbury and York, each controlled by an Archbishop, besides which there are 41 bishops and 38 suffragan and assistant bishops. Under the bishops are about 34 deans and 100 archdeacons. Under mandate of the King each province may sit in convocation, or council, for the purpose of passing regulations, resolutions, etc., affecting the clergy and the church in general. Such measures must be approved by the House of Parliament before they become effective. The latest available statistics (1915) show that there were 2,359,599 full members with 14,079 ministers. The number of adherents is about 7,000,000. There were also 3,063,437 Sunday school pupils and Bible class members. Voluntary offerings for the year 1915-16 totaled £7,061,000.

EPIRUS. A district of southern Albania and northern Greece, of uncertain boundaries. Population, about 230,000. The principal towns are Argirocastro, 12,000; Korytza, 8000. (Estimated in 1919.) In November, 1914, Greece, with the consent of the Powers, occupied North Epirus, and in March, 1916, formally took possession of the district. To the close of 1919, this occupation had not, however, been recognized.

EPISCOPAL CHURCH. See PROTESTANT EPISCOPAL CHURCH.

EPSTEIN, RICHARD. Austrian pianist, died in New York, August 1. He was born at Vienna, Jan. 26, 1869. Throughout his life he made a specialty of ensemble playing, having appeared with the foremost chamber music organizations of Europe and America. From 1904-14 he lived in London. In 1918 he founded with S. Gardner (violin) and W. Willeke (cello) the Elshuco Trio.

EPWORTH LEAGUE. See articles on Methodist denominations.

ERITREA. An Italian colony on the west shore of the Red Sea, with an estimated area of 45,800 square miles, and a coast line of 670 miles. The population is largely nomadic, and was estimated to be about 380,000 in 1919. Capital, Asmara. The largest district is Massawah, having 2275 inhabitants, of whom 524 were European and 480 Asiatics, according to the latest available information. The military force

numbers 297 officers and 11,609 men. Salt is an important product, and pearl-fishing is carried on at Massawah and the Dahlak archipelago to the annual value of 250,000 lire for pearls and 800,000 lire for mother-of-pearl. Scarcity of water necessitates wide irrigation before crops are successful. Camels, oxen, sheep, and goats are common, and the produce consists of meats, hides, and butter, which supplies the local trade. In 1919 gold mines working about 6 miles from Asmara began to give indication of hopeful results. For the financial year of 1918-19, the revenue and expenditure of the colony was estimated at: Colonial revenue, 6,970,007 lire; state contribution, 6,650,000 lire; total revenue, 13,620,007 lire. expenditure, civil administration, 12,992,046 lire; military, 4,081,648 lire; total expenditure, 17,073,694 lire. There are 74 miles of railway from Massawah to Asmara, and now the line is being taken to Keren (58 miles) and Agordat (46 miles). There are 12 post offices, a telegraph line of 313 miles in length, and 471 miles of telephone lines. Two wireless telegraph stations have recently been opened. The imports and exports and tonnage entered (1916) are given in the previous YEAR BOOK. No later statistics are available. Governor, appointed in 1916, Senator Nobile Giacomo de Martino.

ESSAYS. See LITERATURE, ENGLISH AND AMERICAN.

ESTOPINAL, ALBERT. Congressman, died at New Orleans, La., April 28. He was born in Louisiana, Jan. 30, 1845, and served in a Louisiana regiment during the Civil War. He was a member of the Louisiana Legislature from 1876-1900, being for the last 10 years of that period in the Senate and he was Lieutenant-Governor of Louisiana from 1900 to 1904. He was elected to the 60th Congress and reelected to the 61st and subsequent Congresses, serving from 1909 to 1919. In politics he was a Democrat.

ETHNOLOGY. See ANTHROPOLOGY.

ESTHONIA. A former dependency of Imperial Russia, north of Livonia, and to the south of the Gulf of Finland. Area, 7605 square miles. Population, estimated in 1919, 1,744,000. It includes the five districts of Yuryev, Fellin, Werro, Pernau, and Oesel. Capital, Revel, fortified seaport with a population, estimated prior to the war, at 137,600. On May 3, 1918, the British government recognized the Estonian National Council as a de facto independent body. See WAR OF THE NATIONS.

EUPHONY SOCIETY. See MUSIC, *Choral Societies*.

EVANGELICAL ASSOCIATION. A denomination largely composed of German-born citizens of the United States, who are scattered over all sections of the country. Its doctrines are very similar to those of the Methodist Church. According to 1919 statistics there were 154,564 communicants, 1697 churches, and 1160 ministers. Sunday schools showed an enrollment of 198,435 pupils, with 24,358 officers and teachers, besides a Young People's Alliance with 1148 societies and 39,718 members. The principal periodicals are the *Evangelical Herald*, and the *Evangelical Messenger*, published by the association in Cleveland, Ohio. Besides these, several periodicals are printed in German. Several hospitals are maintained in Philadelphia, Chicago, and other cities in the Middle West. Edu-

cational institutions are as follows: Correspondence College, Reading, Pa.; Evangelical Theological Seminary, Naperville, Ill.; Northwestern College, Naperville, Ill.; Schuykill Seminary and Evangelical School of Theology, in Reading, Pa.; and a preachers' seminary in Germany. The headquarters of the association is in Cleveland, Ohio.

EVANGELICAL CHURCH, UNITED. The *Year Book* of the denomination shows the following figures for the year ending June 1, 1919: 88,847 members, showing a slight decrease from last year; 949 organized congregations, with 535 itinerant preachers, and 200 local preachers; 955 Sunday schools, with 13,409 officers and teachers, and a total enrollment of pupils of 138,632. The total value of the 410 parsonages was \$994,175; of the 897 church buildings, was \$4,930,616; while total value of all property was \$7,066,662. There were 442 missionary societies, which contributed \$37,389 during the year, besides 124 Young People's Societies with a membership of 4049 contributing \$8940 for missionary work. Missionary work is carried on principally in China, and on the Platte River. There were also 306 home missions operated during the year, a slight decrease from last year. The following colleges are maintained by the church: Albright College, Western Union College, the Bible Teachers' Training School, New York City, and the Illinois Training School for Christian Workers. The principal publication is the *Evangelical*, with publishing house at Harrisburg, Pa.

EVANGELICAL SYNOD OF NORTH AMERICA. Formerly the German Evangelical Synod of North America, this denomination stands for the positive and progressive principles of the German Reformation and emphasizes the union of the spirit in the bonds of peace among all the Protestant bodies of the country. According to the last available statistics (1918) there were 1414 congregations of which 1014 were in active membership with the Synod; 1057 pastors, with 260,213 communicants; 128,469 Sunday school pupils, with 12,546 teachers and officers. The total value of the 1293 churches, 783 school or Sunday school buildings, 917 parsonages and 525 cemeteries was given as \$18,439,172. There were also 242 men's societies with 13,592 members; 1060 Ladies' Aid societies with 63,368 members; 717 Young People's societies with 28,768 members and 97 mission societies with 4606 members. Benevolences of all kinds totaled \$654,256.17, of which \$305,279.20 was given over to the Red Cross, War Welfare, and Y. M. C. A. Bequests for the 13 months ending Sept. 30, 1919, totaled \$8319.97.

Missionary work is carried on in India and many parts of the United States. In the United States in 1919 there were 80 mission pastors in 17 districts and two outlying fields, maintained at the expense of about \$40,000. A new mission was started in Akron, Ohio. The Board of Foreign Missions reports great progress in their Indian schools, there being 4740 pupils in them at the beginning of 1919. A new mission is being organized for work in Honduras, and men will be sent down there in the spring of 1920. The Eden Publishing House, the official publication agency of the denomination, is in St. Louis, Mo., and there is a branch in Chicago. The Eden Theological Seminary is also at St. Louis and a preparatory academy is also maintained

at Elmhurst, Ill. The church maintains 12 deaconesses' homes and hospitals, two for epileptic and feeble-minded, and eight homes for orphans and old people, valued in the aggregate at nearly \$1,500,000.

EVOLUTION. See ZoöLOGY.

EXPERIMENT STATIONS. See AGRICULTURAL EXPERIMENT STATIONS.

EXPLORATION. Geographical exploration is steadily passing from its primary and limited purpose of merely discovering the existence of unknown lands or seas to higher phases of economic research and industrial utility. Its objects have been definitely described by the Smithsonian Institution as increasing our fund of information as to the inhabitants, the fauna and flora, and other features of the little-known regions of the earth. As in late years, war conditions have largely confined geographical exploration in 1919 to the western hemisphere whose investigators have almost entirely carried on this work, whether on their own or in distant continents.

AFRICA. In the interests of the Smithsonian Institution the Collins-Garnier French Congo Expedition (1916-19) continues its researches. From the base at Fernan Vas, Congo, despite adverse war difficulties, its members thoroughly explored adjacent regions for vertebrates, especially the great apes. In January last three of the seven consignments had been received by the Institution. These included 2000 specimens—antelopes, buffaloes, chimpanzees, gorillas, monkeys, and red river hogs. Another party, the Smithsonian African Expedition, under Edmund Heller, took the field in 1919. It is to collect animals, plants and other materials for comparison work with the African collections in the National Museum. The field of operations covers the Cape region, the Zambesi Victoria Falls, western Rhodesia and the country surrounding Lake Tanganyika—considerable parts of little known Africa.

The Supreme Council of the Allies has issued provisional mandates for the conquered African colonies, as follows: German Southwest Africa to the Union of South Africa; German Southeast Africa to be divided between Great Britain and Belgium; Togo Land and the Cameroons to be divided between Great Britain and France. While the recasting of colonial possessions has caused much European work of geographical research, yet it has been largely economic. The Royal Society of Great Britain is supplementing earlier investigations of North Uganda by studies of the natives on the elevated grass lands between Lake Victoria and western Rift Valley. Under the Rev. John Roscoe—who has served many years in Uganda—the pastoral conditions and dairy methods of the Bahima, Batusi, and Baganda tribes will be thoroughly investigated—to the advantage, it is expected, of white settlers in Africa. Italian explorers have discovered in Erytheria, near the Abyssinian frontier, important bodies of chloride of potash. Years of African exploration and research by Captain Augiéras, of the French army, have been given form in 1919 by map and memoir of the western Sahara, a region practically unknown 15 years since, which contribution received the second award of the *Société de Géographie*. The dominant feature is a central plateau between 6° to 9° west longitude, and 28° to 31° of north latitude, of which El-Eglab is the highest region.

Surrounding the main plateau are encircling important depressions, making it a most rugged country. Two adjacent regions are yet badly known—the country between El-Eglab and Mauritania, and a desert to the southeast of El-Arucha. France has resumed its geographical extension in the Middle Atlas mountain range of Morocco, the least known and most inaccessible region of northern Africa. It was a preliminary reconnaissance made by airplane. The country flown over lies between Mekines and the sources of the Mulouya. It was barely known along its northern and western borders; the main country was blank on all maps save the narrow itinerary of Segonzac in 1905. Inhabited by savage and hostile Berbers, its direct invasion offered exceeding difficulties. The success in satisfactorily outlining the main features of the country by photography from the airplane demonstrates the practicality of using this novel method of cartography in other remote regions.

ASIA. War emergencies and demands put a stop to field work in general. However, Col. Sir W. Buchanan reports a recent visit into the little known valley of Chumbi, Tibet, the journey being made via Natu Pass to Phari. War researches have thrown light on the mineral resources of Georgia, which prove to be important although almost entirely unexploited. Manganese is the most valuable, as there are estimated to be 110,000,000 tons available, centred in the Tchiaturi region. In the known coal fields there are 900,000,000 tons available in Tkerboceli and Guclati, while other deposits may have equally large amounts. A surplus of 300,000,000 bushels of grain in the Omsk district, Siberia, gave new impetus to navigation through the Siberian Ocean to and from Europe, and hydrographical researches are again in progress. It is planned to stimulate ocean traffic to Siberia by means of a great depot to be established on the west coast of Nova Zembla where can be harbored freight barges to await favorable ice conditions in Kara Sea during the short summer season. War conditions have directed special attention to little-known Siberia. This gives special importance to Ivan Lind's memoir on the economical geography of western Siberia, published in *Ymer*, 1919.

EUROPE. Geographical work in 1919 was practically confined to researches bearing on ethnographical problems, which element was to be an essential factor in connection with the boundaries fixed for future European nations by the Peace Conference. Fuel shortages in France caused intensive search for coal fields capable of exploitation. One was traced for 12 miles extending southeastward from Mons, near Lyons. Although the coal is from 1000 to 2300 feet below the surface its profitable working is expected. Commercial resuscitation is to be advanced in France, through the division of the country into 16 economic districts with regional capitals. It is worthy of note that in 1918 the distinguished geographer, Gen. Jules Shokalsky, in Petrograd, had funds allotted and force assigned for the preparation of a second and enlarged edition of the *Geographical Gazetteer of Russia*.

NORTH AMERICA. *Canada.* Geographical explorations of the enormous extent of unknown Canada are, in general, the outcome of parties of the Canadian Geological Survey engaged in the investigation of areas that promise to be of economic importance. Among these the more in-

teresting reports are the following: By McLearn, Smoky River, Alberta; by Doeling, Natural gas; by Macoum, Biological investigation of upper Athabasca and Shovel Pass regions; and by Anderson, the mammalist expert of the Canadian Arctic Expedition (1913-16), Wild life sanctuaries in Saskatchewan and Alberta. In connection with geological researches James White sums up the fuel resources of western Canada. He puts the actual coal reserves at 412,616,000 metric tons, of which fifteen-sixteenths are lignite or sub-bituminous. The Alberta field contains 87 per cent of all coal in Canada. Illustrative of colonization in Northern Canada and of facility of travel by water, may be mentioned the reconnaissance of F. H. Kitto who, traveling chiefly by canoe, made a journey from McMurray, junction of the Athabasca and Clearwater, across North Alberta, Saskatchewan, and Manitoba to Port Nelson, Hudson Bay. Efforts by private parties to survey by airplane the forests of Labrador have been attempted in 1919. Dr C. D. Walcott, Secretary of the Smithsonian Institution, continued in 1918 his earlier researches of the geological structure of the upper Bow Valley and the headwaters of Cascade River.

UNITED STATES. The most important work of geographical import in the United States has been the continuance of the invaluable researches conducted by the Geological Survey, under George Otis Smith, which mark an epoch in this age. The Survey investigations of greatest economic value are as follows: The discovery of new deposits and the tabulation of known mineral resources of the country—especially of iron, manganese, tungsten, quicksilver, potash, nitrates, gas and oil, measurement of ground-water resources and stream-flow; researches in possible replacement of coal-fuel by water-power; and classification of public lands as to mineral contents. In the Virgin group the Survey made geological reconnaissance of St. Croix, St. John, and St. Thomas.

Of special interest are the extensions in researches covering the prehistoric natives of the country, carried on by the Bureau of American Ethnology in its work of excavating and repairing the stone-age monuments in the South-west. Continuing his exploration of the castles and towers in Southwest Colorado and Southeast Utah, Fewkes discovered two new towers in McLean basin which apparently antedate the pueblo and cliff dwellings. The most remarkable of these remains, called the first American apartment house, the Aztec Spring, Montezuma Valley, ruin has been presented by Mr. Van Kleeck to the National Park Service. Its base of 300 square feet area, its hundreds of rooms, its massive walls of dressed sandstone and its large cedar posts in the remains of this communal building, indicate that the men of the stone age were equally skilled in architecture and in transportation. Among valuable resources discovered through war researches should be mentioned the wonderful extension of phosphate lands in Florida which, now recognized as one of our greatest natural assets, supply more than half the world's supply.

SOUTH AMERICA. A coöperative investigation of the botany of Ecuador is in progress by the United States National Museum, the New York Botanical Garden, and the Gray Herbarium of Harvard University. Under J. N. Rose (1918)

a very large collection was made, including about 6000 botanical specimens, covering several sections across the western Andes to the interior Andean valley and down from San Antonio to Loja. The U. S. National Museum, by P. A. Means, made (1917-18) archaeological investigations in Peru and Bolivia. The least known places in Peru—Maranga and Pando—are Inca ruins of interest, pyramids and palaces. Bolivian archaeology was studied principally at La Paz. Under charge of W. Beebe, a tropical expert, the N. Y. Zoölogical Society has established a tropical research station in British Guiana, at Katabo, the junction of the Cutuyi and Mazaroni rivers. Its researches are to pertain to the evolution, adaptation and survival of various forms of tropical life.

MISCELLANEOUS. The expedition sent by the Smithsonian Institution to Borneo and Celebes (1916-18), under H. C. Raven, was most successful in its field work. The main collection includes about 1500 mammals, 2800 birds, and a fine series of ethnological specimens. All were from regions not before represented in the National Museum. Photographs of tombs and images illustrate the art of prehistoric races of these countries. Dr. Kaudern, of Sweden, explored the northeastern peninsula of Celebes, and the central parts from Paloe to Koewali. Forestal researches were made by D. E. Hutchins of the Kauri woodlands of New Zealand. In the Waipoua forest northwest of Auckland, an area of about 100 square miles, were noted two trees, probably the largest in the world. Each contained 296,000 superficial feet of sawable lumber, claimed to be double the amount of the largest known of the California big trees. An account is given by Dr. Basedono of his exploration (1916) of northwestern Australia. His journey from Derby to Napier rivers and the Peterson ranges throws light on physical conditions of the enormous semi-desert of central Australia, which has been estimated to have an area of approximately 3,000,000 square miles. While search for tungsten and other ores was fruitless, he obtained much information as to the fauna, flora, and also as to the natives between Ord and Fitzroy rivers. At the request of the Dominican government, to ascertain the extent of its resources, a geological survey of San Domingo has been made by T. W. Vaughan, U. S. Geological Survey. Under special orders, Lieut.-Col. Townsend Whalen with two companies of regular infantry has explored the country to the east of Panama. The reconnaissance covered the territory between Colon and the old harbor of Nombre de Dios, and from the sea inward to the headwaters of the Chagres River. It proved to be an uninhabited, rough, hilly country, covered by the densest tropical vegetation. The Rio Grande dwindles into a very short, unimportant stream while the Rio Piedras proved to be of great length. See **POLAR RESEARCH.**

EXPORTS, AGRICULTURAL. See **AGRICULTURE.**

EXPOSITIONS. There were no great international exhibitions held during the year; but there were a large and increasing number of trade fairs held, of which the more important are mentioned below.

The Grand Central Palace in New York City (**YEAR BOOK** for 1918 p. 198) was taken over in October by a corporation for the purpose of establishing an International Exposition of In-

dustries to include a series of expositions such as the International Machinery and Mining Industries Exposition, Municipal Equipment Exposition, Farm Tractor and Implement Exchange, Hardware and Housefurnishings Exchange, and Factory Appliances Exposition, and at which it is planned to exhibit and sell manufactured American products here and abroad. The purpose of this enterprise to extend American commerce in foreign countries and to import foreign goods to America through the medium of an International Exposition of Industries is founded on a thoroughly efficient organization plan in the hands of capable executives.

The fifth British Industries Fair was held in London during February 24th-March 7th, and there were 570 exhibits as follows: Glass and pottery, 114; paper, printing, and stationery, 130; fancy goods, 128; and toys, 198, all of British manufacture. The successful production in Great Britain of articles previously manufactured abroad was most satisfactorily demonstrated. The British Science Guild held a British Scientific Products Exhibition in London from July 3d to August 5th. The object in view was to illustrate recent progress in British science and invention and to help the establishment and development of new British industries. The exhibition was divided into the following sections: Agriculture, aircraft, chemistry, education, electrical appliances, engineering, fuels, medicine and surgery, metallurgy, paper (illustration and typography), physics, and textiles. A Key Industries Exhibition was held in London during October 8th-18th, under the auspices of the Tariff Reform League, to show what Great Britain had accomplished during the war in manufacturing essential commodities which had formerly been almost completely controlled by Germany. The term "key industry" is applied to those industries which are of vital importance since upon their existence that of other and greater industries depends, and includes such articles as dyes, magnetos, optical-glass, tungsten, manganese, lead, graphite, spelter, rubber, and antimony. All these essential key products, the raw materials of which are largely produced in the British Empire, had been manufactured in Germany before the war, and resold to Great Britain.

In November there was held in London a Shipping and Engineering Exhibition at which the exhibits represented the advance which Great Britain and other countries have made, largely during the period of the war, in many branches of scientific knowledge and attainment in matters directly connected with engineering, although not wholly confined to those departments of industry. The Federation of British Industries organized an exhibition of strictly British-made goods that was held in Athens, Greece, during October for the purpose of soliciting trade from the Eastern markets in Asia Minor, Turkey, and to a great extent in the Balkans and the Levant. The success that attended the British Industries Fairs held in London and in Glasgow has led Birmingham to organize a similar exposition for 1920. At this fair, which will be under the official organization of the municipality and Chamber of Commerce of Birmingham, exhibits are to be restricted to the hardware and kindred trades, such restriction being thought necessary to prevent overlapping as between fairs and to enable buyers to find

similar articles displayed together. Much interest has been aroused in British trade circles by the proposal to hold in London during the summer of 1921 a great exhibition of the manufactures and products of the British Empire, with the object of promoting imperial trade. The scheme, which has received the support of the colonial governments, has been submitted to the British government for official approval.

In France the fourth International Sample Fair of Lyon was held during March 1st-15th. There were 4700 different exhibits shown, valued at nearly \$4,000,000. The United States allotted \$2500 for rented space and 618 (next to France the largest number) of the exhibitors were from that country. Although larger than previous fairs, the space was insufficient and as the number of visitors was so great it was decided to hold a fair in the spring from March 1st to March 15th, to include jewelry, horology, wools and cotton, hats, boots, leather goods, motor cars, electric goods and chemical products. A second fair, to be held from October 1st to October 15th, will include exhibits from metallurgy, industrial construction, agricultural machinery, and foreign and colonial exhibits. A third Sample Fair was held in Bordeaux during May 16th-31st. The articles shown were largely of a character suitable for export to the French Colonial possessions, and a number of American exhibits were transferred from Lyon to this fair.

The third Swiss Sample Fair was held in Basel from April 25th to May 8th, and at it only firms that were purely Swiss were allowed to exhibit. Over 1380 firms were represented as compared with 831 in 1917 and 990 in 1918. The business transacted amounted to about \$14,000,000, an increase of \$5,000,000 over last year. In addition to the foregoing a French Sample Fair was held in Basel in the buildings of the Swiss Sample Fair during September 5th-21st. The exhibits were distributed among the following groups: 1, food; 2, furniture; 3, fashions and clothing industry; 4, articles for offices, stationery; 5, graphic arts; 6, articles for the household, lighting, heating; 7, watch trade and jewelry; 8, toys and small wares; 9, perfumery and pharmacy, and 10, sundries. Also a Belgian Sample Fair was held in Basel during October 15th-31st in which only goods manufactured entirely or in part in Belgium were on exhibition.

The third Netherlands Annual Fair was held in Utrecht from February 24th to March 8th. The number of exhibitors was 1225 as against 690 in 1917. It is proposed to make the Utrecht Exhibition a permanent affair and plans for buildings to cost about \$804,000 have been prepared. The fair in 1920 will be held from February 23d to March 6th. The first Aeronautical Exposition was held in Amsterdam during August and September. The exhibits were classified in 17 groups including all kinds of aeroplanes, motors, and the special articles used in the equipment of the various planes.

The first of the Import Fairs to be held in Frankfort, Germany, was opened on October 1st. Nearly 2000 firms had exhibits, among which were American, British, and French concerns. Special preference was given to articles urgently needed by the Germans and particularly such articles as can be produced in Germany, provided raw materials can be had. The Leipsic

fair was opened on September 1st and the conspicuous feature was the absence of substitutes upon which German industry was so dependent during the war period; also the exhibits indicated that the German manufacturers were able to draw upon the home stocks of raw materials which had been reserved for the war industries and on the other hand raw materials coming in from abroad were being rapidly absorbed by the industries which had been wanting them.

The Scania Fair was held in Malmo, Sweden, during June 30th-July 6th and its exhibits were confined exclusively to articles of Swedish manufacture, and there were 750 exhibits. The second Swedish Industries Fair was held in Goteborg during July 7th 13th, and the number of exhibitors was 1057 as against 544 in 1918, and the attendance was 36,615. A Norwegian-American Exhibition was held in Christiania, Norway, during September 10th-24th.

South America and especially Brazil, have held various expositions during the year. In Rio de Janeiro there was held on July 12th, the first exposition of cereals, including cereals of all sorts, vegetables, horticulture, floriculture, ornamental plants, seeds, bulbs, agricultural and gardening implements and accessories; on August 30th, an exposition of aviculture and domestic animals, promoted by the Brazilian Society of Aviculture; and on September 20th, the second great annual fair, organized by and under the auspices of the Rio de Janeiro municipal government. On Jan. 24, 1920, the fifth large Exposition Fair of fruits, vegetables, flowers, and agricultural industries will be held.

The first annual Commercial Fair in which allied and neutral countries will be permitted to exhibit is announced to be held in Brussels, Belgium, during Apr. 4-21, 1920.

The South Australian Chamber of Manufactures at Adelaide announces that it is preparing to hold at Adelaide, from March 26th to May 22, 1920, an All-Australian Peace Exhibition of manufactures, products, arts, and industries.

The first Spanish Sample Fair will be held in Barcelona during May 15-30, 1920.

It was reported in November that the Tokio municipal authorities had decided to commemorate the restoration of peace in a substantial form by holding a grand exposition at an outlay of \$2,000,000, or \$2,500,000 in the spring of 1920.

An International Tea Congress and Exposition is announced to be held in Batavia, Java, early in 1921.

Plans for an Industrial Exposition to be held in Bombay, India, in 1922 have been prepared.

The Minister of Commerce of France has promulgated a decree providing for the organization of an International Exposition of Decorative Arts to be held in Paris during the summer of 1922.

Preliminary steps have been taken in Detroit, Mich., in a movement to hold a world's peace exposition in 1922 or 1923.

EXTENSION WORK. See AGRICULTURAL EXTENSION WORK.

FAILURES. See FINANCIAL REVIEW.

FALKLAND ISLANDS. Crown colony of the United Kingdom, constituting a group of islands in the South Atlantic, composed of East Falkland, with an area of 3000 square

miles; West Falkland, with an area of 2300 square miles; and about a hundred small islands with an aggregate area of 1200 square miles; also the dependency of South Georgia, a group of islands lying to the south, with an area of about 1000 square miles, making a total of 6500 square miles. Among other dependencies are the South Shetlands, the South Orkneys, the Sandwich group and Graham's land. The estimated population in 1917, including the whaling station of South Georgia, was 3241, with a birth rate (1917) of 18.82 and a death rate of 4.93 per 1000. The chief town is Stanley, with an estimated population of 950 inhabitants.

Sheep farming is the leading industry, having an estimated pasturage area of 2,325,000 acres in 1919. It is estimated that in 1919 there were slightly over 800,000 sheep. Whaling is successful, the catch in recent years averaging about 8000 (1918-19). The total value of this industry was over \$1,500,000 in 1919. In South Georgia there were about 3000 seals killed. In 1917 71 vessels, of 133,132 tons, entered. The leading exports in order of their importance, for 1919, were: Wool, (about \$300,000); whale produce, tallow, and skins and hides. The chief imports similarly arranged in order of their importance were: Groceries, timber, coal, wearing apparel, haberdashery, and hardware. In 1917, the financial status of the country was, in pounds sterling: Total revenue, 45,588; total expenditure, 29,687; imports, 1,256,906; exports, 1,870,903; with no public debt. The Protectorate was established to provide, at Stanley, a coaling station for vessels rounding Cape Horn and to protect the whale fisheries. The governor in 1919 was W. Douglas Young, who was assisted by an executive council and a legislative council. See POLAR RESEARCH, ANTARCTIC.

FAMILY SOCIAL WORK. See CHARITIES.

FARLOW, DR. WILLIAM GILSON. Botanist, died at Cambridge, Mass., June 3. He was born at Boston, Mass., Dec. 17, 1844; graduated at Harvard in 1866; studied medicine, but later devoted himself to botany and passed several years in Europe in research. He became assistant professor in botany at Harvard in 1874, and from 1879 to the time of his death was professor of cryptogamic botany there. He was officer and member of the leading scientific societies. He wrote *The Black Knot* (1876); *Diseases of Olive and Orange Trees* (1876); *The Gymnosporangia or Cedar; Apples of the United States* (1880); *Marine Algae of New England* (1881); *The Potato Rot*; *Index of Fungi*, etc.

FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA. A federal Council of 31 constituent denominations, including 140,000 local churches, with more than 18,000,000 communicants, representing something like 50,000,000 of the people, for the pur-

pose of coördinating the service that the separate denominations render the country. It is an official body through which the Protestant Evangelical churches of the nation speak and work together in matters of common interest and purpose. Besides national offices in New York and Washington, the Council operates by means of eight permanent commissions: Commission on Interchurch Federation, Commission on Evangelism, Commission on the Church and Social Service, Commission on Temperance, Commission on Church and Country Life, Commission on Christian Education, Commission on International Justice and Goodwill, Commission on Relations with the Orient. The Commission on Interchurch Federation reports the formation of five new city federations: Norfolk, Va., Omaha, Neb., St. Paul, Minn., Youngstown, Ohio, and Akron, Ohio. The Commission on Church and Social Service did valuable work in army and navy centres, industrial centres and negro centres. It coöperated with the Red Cross in this work. The Commission on Temperance and the Field Secretary have spent much time and energy in the distribution of prohibition literature, writing and printing of advertisements and posters, and the producing of prohibition moving pictures. This Commission coöperates with 16 other prohibition societies. The Commission on Church and Country Life has been making a nation-wide survey of religious conditions in rural communities. The Commission on Relations with the Orient started a movement to urge Congress to introduce an amendment to the Constitution to the effect that Chinese and Japanese may be admitted to citizenship in the United States, but at the same time to in no way affect the Chinese Exclusion Law, and other immigration laws.

A special Commission was formed at the beginning of the war to be known as the General War-Time Commission of the Churches to co-ordinate the war work of the various Protestant denominations. It has closed its work except for the contemplated issuing of a report and biography of the part played by the churches in the war.

The Commission on Relations with France and Belgium is coördinating the relief and reconstruction work of several of the denominations in the recent war area, and contemplates the raising and expenditure of \$3,000,000 during the current year. Work of unification in the missionary field is carried on by the Home Missions Council, which was organized in 1908. Permanent headquarters were not opened however until March, 1918, and an Executive Secretary was secured at that time. The Department of Religious Publicity issues the monthly magazine, *The Federal Council Bulletin*, and furnishes general religious news to the secular and the religious press. The national offices of the council are in New York city, and the general secretary is the Rev. Charles S. Macfarland.

FEDERAL HOUSING BUREAU. See HOUSING.

FEDERAL TERRITORY. A territory governed by the Commonwealth of Australia, situated within the state of New South Wales. The area is about 900 square miles, and the population was estimated in 1919 at about 3000. It was acquired by the Commonwealth in 1910 from New South Wales at the site of the perma-

nent capital of the Commonwealth, which, under the name of Canberra, was founded in 1913.

FEDERATED MALAY STATES. These states are composed of Perak, 7800 square miles, population 494,057, capital Taiping; Selangor, 3156 square miles, with a population of 294,035, capital, Kuala Lumpur; Negri Sembilan, 2550 square miles, pop. 130,199; capital, Seremban; Pahang, 14,000 square miles, pop. 118,708, capital, Kuala Lipis; making a total of 1,036,999, of whom 420,840 were Malays, 433,244 Chinese, and 172,465 natives of India. In 1917 there were a number of British schools assisted or maintained by the government, with an average enrollment of 6056 boys and 1526 girls, and an average attendance of 5779 and 1422 respectively.

The revenue of the states in 1917 was £7,647,872, and the expenditure £4,769,187. The leading items of revenue in 1917, in the order of their importance, were as follows: Licenses, customs, railways, land revenue, fees of court or office, interest, municipal; and of expenditures, railways, public works, miscellaneous services, personal emoluments, other charges, and interest on advances. Public debt 1917. £1,750,000.

The staple cultivations of the Federated Malay States are coconuts, rubber, tapioca, gambier, rice, sugar, pepper, and nipa palms. The chief industrial enterprises are the cultivation of rubber and tin mining. Various irrigation works have supplied rice land and drinking water. Many excellent timbers are to be found in the forests, besides gutta percha, oils, resins and canes. In 1917, 713,540 tons of timber of all kinds were taken from the forests, and the gross revenue of the forest department for that year amounted to £87,120.

Among the leading articles of import for 1917, arranged in the order of their importance, were: rice, opium, tobacco, cotton goods, sugar, condensed milk, spirits, iron ware, and machinery. The chief exports arranged in similar order: cultivated rubber, copra, rice, tapioca, coffee, and tin. Shipping, in 1917, excluding native trade: entered 3481 vessels of 1,395,211 tons; cleared 3492 vessels, of 1,395,073 tons.

The government has the construction and operation of railway systems of the whole peninsula south of the Siamese boundary, including the railway on Singapore Island, under its control. The section linking up the southern Siamese railway system, and the Perlis-Siam section was completed and opened in July, 1918. The total mileage open for traffic, including leased lines, was 930 miles in 1917. The high commissioner at the beginning of 1919 was Sir A. H. Young.

FEDERATION OF LABOR, AMERICAN. See LABOR, AMERICAN FEDERATION OF.

FEDERATION OF NEO-MALTHUSIAN LEAGUES. See BIRTH CONTROL.

FELL, DAVID NEWLIN. Judge, died in Philadelphia, Pa., September 22. He was born at Buckingham, Pa., Nov. 4, 1840, and served with the Pennsylvania volunteers during the Civil War. He practiced law in Philadelphia until 1877 when he became a judge of the Court of Common Pleas (1877-94). From 1894 to the time of his death he was a justice of the Supreme Court of Pennsylvania and was Chief Justice from 1910. In politics he was a Republican.

FENCING. The fencers of Columbia Uni-

versity in 1919 for the second time in succession won the intercollegiate tournament, with 27 victories and 9 defeats. The U. S. Naval Academy finished second with 25 victories and 11 defeats, and Harvard third with 20 victories and 16 defeats. The contests for individual honors resulted in a tie between Lieut. Millard J. Bloomer of Columbia and E. R. Gay of Harvard, each of whom won 11 bouts and lost 1. In an extra bout to decide the supremacy Bloomer was the victor by 4 points to 2. The New York Military Academy captured the interscholastic title by defeating Paterson, N. J. High School by 5 bouts to 4.

The championships of the Amateur Fencers' League were resumed for the first time since 1917. In the final bouts of the senior team foils the New York A.C. defeated the West Point Officers by 5 bouts to 2. The individual foils and sabre championships resulted as follows: Foils won by Sherman Hall, New York A.C.; duelling swords, won by W. H. Russell, Boston Sword Club; sabres won by A. S. Lyons, Fencers' Club.

In dual meets during the year Columbia defeated Pennsylvania, 6-3, and 8-1; Harvard 7-2 and Yale 7-2 and was defeated by the U. S. Naval Academy 11-2. Yale defeated Harvard 5-4 and Pennsylvania 5-4 and was defeated by Columbia 2-7 and by U. S. Naval Academy 1-8.

FERRIERITE. See MINERALOGY.

FERTILIZERS. The year 1919 was one of uncertain and usually inadequate supply and widely fluctuating but generally high prices of fertilizers both in the United States and abroad. Fertilizer statistics during recent years have been very incomplete and unsatisfactory, but enough is known to make it clear that production and consumption have not kept pace with the needs of good farm practice.

At the close of the war the situation was reported by the commission appointed by the Secretary of Agriculture to study agricultural conditions in Europe to be especially critical in Great Britain, France, and Italy. In Great Britain it was relieved to some extent by utilization of by-products from munitions-making and other manufacturing industries, but was still so serious that a British commission appointed to consider post-war readjustments urged a vigorous educational campaign for increased use of fertilizers and the utilization of the excess production of sulphuric acid in the manufacture of superphosphates. The Prime Minister proposed government control, supply, and, if necessary, manufacture of fertilizers. The situation seriously menaced French agriculture and was the cause of grave anxiety in Italy, which at the close of the war was securing only about 16 per cent of the normal supply of phosphate and much less than the normal supply of nitrogen compounds, with the result that production, especially of breadstuffs, was greatly reduced. It seemed clear that all of these countries for some time to come would need to import large quantities of fertilizers, especially phosphates. Germany appears to have taken prompt steps to meet the situation, and is reported to have produced 520,000 tons of fertilizer nitrogen, phosphoric acid, and potash in 1918-19 as compared with 220,000 tons in 1917-18. The production of synthetic nitrogen compounds had been so developed in Germany during the war that it is thought that the combined produc-

tion of these compounds and ammonium sulphate in that country was sufficient for its normal needs. Reports indicate that the need for fertilizers has not been fully met in other countries, as for example, in South Africa, Australia, New Zealand, and even in Egypt, with its annual inundations of six tons per acre of fertile Nile silt. The outstanding need here appears to be for nitrogen, with phosphate second in importance. In the other countries the prime need appears to be for phosphates. Diligent search is being made, with some success, in these countries for workable deposits of phosphates.

A distinct advance in the direction of efficient use of fertilizers was made during the year through the advocacy by fertilizer manufacturers of simplified and high-grade fertilizer mixtures. The advantage of this over the use of almost endless and meaningless "brands" and low-grade mixtures heretofore followed is obvious.

A survey of the fertilizer industry by the Fertilizer Control of the Department of Agriculture showed that three-fourths to seven-eighths of the mixed fertilizers sold to farmers during 1917 and 1918 was so-called "filler" which usually has little or no value as fertilizer. While it is recognized that a certain amount of filler is not only legitimate but necessary in mixed fertilizers, it is obviously bad economy to use low-grade fertilizers in which the amount of filler is unnecessarily large. The manufacturers of fertilizers are therefore rendering a real service in encouraging the use of high-grade fertilizers and endeavoring to limit the use of filler.

There was a distinct revival during the year of advocacy of buying unmixed fertilizer materials and using them separately or in such mixtures as can be readily made on the farm, but some difficulty was reported in obtaining unmixed materials from dealers in fertilizers at prices which would make the practice advantageous.

Under authority of the Food Control Act the Department of Agriculture continued, through a license system, to exercise a certain measure of control of the fertilizer business, endeavoring especially to equalize and stabilize prices and to maintain a fair price scale.

Considerable attention was given during the year to fertilizer legislation, particularly with reference to securing greater uniformity in State legislation on the subject. A Federal law (H. R. 15,327, 65th Congress, 3d Session) was introduced in Congress during the last session but was not acted upon. Forty-three States and Porto Rico now have fertilizer laws. Montana, Nebraska, Nevada, New Mexico, and Wyoming, of which the combined consumption of fertilizers was about 3500 tons in 1918, have no laws.

PHOSPHORIC ACID. Evidence continued to multiply that phosphoric acid is the element of plant food most widely and urgently needed. Soils appear to be more generally deficient in available phosphoric acid than in other necessary fertilizing constituents. Fortunately the world has abundant supplies of phosphates. Unfortunately they have not recently been made available as rapidly as was desirable. It is estimated that the world's shortage of phosphates during the war amounted to 15,000,000 tons; the United States exports fell off 5,000,000 tons and became less than those of Tunis. The out-

put of the United States in 1918 was nearly 2,500,000 tons, somewhat less than in 1917. The indications are that the 1919 output was no greater than that of the previous year. This is attributed to shortage of labor and transportation.

There was a general but widely fluctuating rise in price of acid phosphate during 1919, the fall prices being much higher than was anticipated. It was suggested both in England and in this country that the excess production of sulphuric acid developed during the war might be used to manufacture acid phosphate and thus increase the supply and lower the price. The war experience emphasized very strongly the importance of an abundant supply of moderate priced available phosphoric acid, particularly as a means of increasing the production of cereals and grasses. The manufacture of acid phosphate appears to be the best means yet devised for supplying this need. The use of fine-ground raw rock phosphate, composting the rock phosphate with sulphur, manure, and soil, and other means that have been suggested have not yet been developed to a degree that warrant their substitution in any large way for the use of acid phosphate.

NITROGEN. Like phosphoric acid, nitrogen is widely needed by soils, and the sources from which it may be drawn are practically inexhaustible. The means of utilizing these resources have been perfected rapidly. The preparation of synthetic nitrogen compounds from the nitrogen of the air received a great impetus during the war. It is stated that at the end of the war Germany was capable of a production in excess of domestic needs. The world's productive capacity during 1919 is estimated at 467,000 tons, of which the United States was capable of producing 100,000 tons, mostly (91,000 tons) cyanamid. The only one of the various plants which the United States undertook to establish during the war for the production of nitrogen compounds for munitions and agricultural purposes which had developed quantity production at the close of the war, namely, that at Muscle Shoals, Ala., had an estimated capacity of 110,000 tons of ammonium nitrate per year.

The possibility of the production of synthetic nitrogen compounds in quantity sufficient to meet ordinary and even emergency needs has been settled affirmatively. There is also no limit to the possible acquisition of the nitrogen of the air through symbiotic fixation by leguminous plants and nonsymbiotic fixation by soil bacteria. This is now the largest means of replenishing and maintaining the nitrogen supply of the soil. Lipman estimates that of the 9,000,000 tons of nitrogen lost annually from the 300,000,000 acres of cultivated land in the United States, there are now available from leguminous plants 1,750,000 tons, from nonsymbiotic fixation 1,500,000 tons, from manure 1,750,000 tons, from atmospheric precipitation 750,000 tons, and from commercial fertilizers 200,000 tons, leaving a deficit of a little over 3,000,000 tons not supplied from any source. It will be observed that commercial fertilizers supply a comparatively small part of the nitrogen needed.

The Department of Agriculture continued during 1919 to sell nitrate of soda to farmers through county agricultural agents on the same

plan as in 1918. The price was \$81 per short ton cash f. o. b. at loading point, as compared with \$75.50 per ton in 1918. There was available for distribution during the year about 150,000 tons of nitrate, 110,000 tons released by the War Department and about 40,000 tons carried over by the Department of Agriculture from the preceding year.

POTASH. Notwithstanding a general world shortage of potash, there was reported to be in storage in the United States at the beginning of 1919 60,000 tons of potash salts, equivalent to 15,000 tons of pure potash. The War Trade Board announced at that time that there was no prospect that Alsatian potash would be available for export before June 1, 1919, and that American fertilizer manufacturers and farmers would probably have to depend during 1919 upon the domestic supply.

The domestic production of potash in the United States in 1918 was, according to the Geological Survey, 52,135 short tons of actual potash (K_2O). The estimated productive capacity of established plants or other actually developed sources was 100,000 tons distributed as follows: From natural brines, 39,255 tons; alunite, 2619 tons; cement mill dust, 1429 tons; kelp, 4292 tons; molasses distillery waste, 3322 tons; Steffens waste water 761 tons; wood ashes, 365 tons; other sources, 92 tons.

The results of the work of the Department of Agriculture during the year on extraction of potash and other products (iodin, salt, ammonia, and bleaching carbon) from kelp were such as to lead to the conclusion that kelp can be made a profitable source of potash and other products, justifying the establishment of a substantial kelp potash industry. Several commercial plants engaged in the industry, however, went out of business during the year, and it is the opinion of some who have investigated the matter that the saline lakes are likely to prove the greatest source of domestic potash for the next three or four years, the continuance of the industry depending upon the price that can be obtained for the product.

Complaint of injury to crops alleged to be due to use of potash salts was investigated during the year. The injury appears to have been limited to potash salts from Searles Lake, which contained a relatively high percentage of borax, and was most pronounced where potash fertilizers were used in relatively large quantity on dry soils. As a result the Department of Agriculture made a ruling to the effect that the amount of borax in potash salts should be limited to 0.5 per cent and in mixed fertilizers to two pounds per ton.

Recovery of blast furnace and cement mill dust as a source of potash promises to develop, particularly since it has been shown that the recently improved Cottrell electrical dust precipitation process can be profitably used with potash at \$1 per unit. The recovery of this material continues in England, where it has been shown that untreated blast furnace dust gives good results as fertilizer for potatoes and mangolds when applied well in advance of the planting of the crop.

The indications are that the war-time production of potash in Germany was better maintained than was generally supposed. The prospect is that abundant supplies of potash will ultimately be available either from the German

mines or from the large and very rich Alsatian deposits.

Moreover, the war experience has taught a more conservative use of potash. It has been learned that many soils do not need potash; that manure and other supplementary sources of potash may temporarily replace potash salts; that soda may to a considerable extent reduce the amount of potash needed.

SULPHUR, MANGANESE, LIME. Further evidence was collected during the year that many soils are deficient in sulphur and are made more productive for many crops by application of sulphur or sulphur compounds. Additional evidence was also secured indicating that manganese is present in many soils in sufficient quantity to play an important rôle in bacterial and plant growth, excessive amounts inhibiting or retarding growth and small amounts stimulating it. It has been suggested that part of the beneficial effect of basic slag may be due to the manganese normally present in the slag.

In view of the well established fact that the need of liming is widespread and that its effectiveness depends largely upon the fineness of the material used, a number of the experiment stations, particularly in the Southeastern States, attempted to reach an agreement as to the degree of fineness and the method of application which should be generally recommended. Their general recommendation was that all the material should pass a 10-mesh sieve and should be used at rates of one to two tons per acre in a rotation of not more than five years, preferably containing legumes, with phosphoric acid and potash added when needed. Lime grinding under State auspices was developed in Maryland, Virginia, and North Carolina during the year.

There was a revival of interest in the use of marl both as a lime fertilizer and as a source of potash.

FERTILIZER FORMULAS. Commonly accepted methods of calculating fertilizer formulas were attacked during the year on the ground that more emphasis should be placed upon plant requirements and less upon soil deficiencies, the required fertilizer formula being determined by subtracting from a full ration of chemicals sufficient for the expected crop the amounts of the fertilizing constituents that the soil may be expected to furnish as shown by long-continued field experiments. The practical result of this procedure is to eliminate nitrogen as a rule from the fertilizer, greatly reduce phosphoric acid, and increase the relative proportion of potash. In fact, a general fertilizer formula arrived at in this way is 1 phosphoric acid to 2.08 potash. See **CHEMISTRY, INDUSTRIAL**.

FICTION. See **LITERATURE, ENGLISH AND AMERICAN**, and articles on **FRENCH, GERMAN, SCANDINAVIAN AND SPANISH LITERATURES**.

FIELD, ROSWELL MARTIN. Author, died at Morristown, N. J., January 10. He was born at St. Louis, Mo., September, 1851, and graduated at the University of Missouri. He was engaged in newspaper work in San Francisco, St. Louis, New York and other cities and he was the author of the following: *In Sunflower Land* (1892); *Echoes from the Sabine Farm* (1891); *The Passing of Mother's Portrait* (1901); *The Romance of an Old Fool* (1902); *The Bondage of Ballinger* (1903); *Little Miss Dee* (1904); *Madeline* (1906).

FIJI ISLANDS. A group of islands in the southern Pacific numbering about 225, of which about 80 are inhabited, and constituting a British Crown Colony. The main island is Viti Levu on which the capital, Suva, is situated (area 4112 square miles). Other islands of importance are Vanua Levu (2432); Tavuni (217); Kadavu (124); Koro (587); Gau, Ovalau, and the Yasawas and Lau groups. Total area including the island of Rotuma (a dependency since 1880), 7435 square miles. Population (Jan. 1, 1919, estimated) 165,991 of whom 91,013 were Fijians and 61,153 Indians. The Europeans in 1916 were 4552. The chief crops were sugar, copra, pineapples, and other fruits, which were also the chief exports. The total trade for 1917 was valued at \$14,987,890 of which imports were \$4,922,015 and exports \$10,065,875. The revenue in 1917 was \$1,630,590; expenditure, \$1,463,445. The chief product has been sugar which at this time formed about 71 per cent of the total exports. The rubber industry recently started promised to become one of the most important in the islands. After the outbreak of the war foreign trade was diverted from its previous channels. The trade with New Zealand greatly increased, especially in respect to exports of sugar, and the same was true of trade with Australia. On the other hand there was a decrease in exports to the United Kingdom while the exports to the United States increased owing largely to the diversion of the copra trade from London to San Francisco. In 1919 the main problem in Fiji was that of an adequate labor supply. The larger part of manual labor had been performed by indentured Indians but lately the system of indenture has been forbidden, the last ship bearing indentured Indians having been admitted in 1916. In the three preceding years the number of indentured Indians decreased from 10,060 to 7232. There is regular steam communication with Australia, New Zealand, Tonga, Samoa, Honolulu and Canada. Tonnage entered and cleared in 1917, 712,048 of which 676,029 was British. The government is under a governor appointed by the crown aided by an executive council, and a legislative council of which the governor is president. Governor of Fiji and High Commissioner for the West Pacific at the beginning of 1918, C. H. Rodwell.

FILTRATION. See **WATERWORKS AND WATER PURIFICATION**.

FINANCIAL REVIEW. For additional information to that given below the reader should consult the following topics: **AGRICULTURAL CREDIT; BANKS AND BANKING; COÖPERATION; INDUSTRIAL RECONSTRUCTION; INSURANCE; NATIONAL BANKS; PRICES; TARIFF; TAXATION; TRUSTS; and WAR FINANCE.** See also the special articles on the various countries, and the States of the United States, as well as the article **LABOR** and the references given there.

GENERAL CONDITIONS. The year 1919, from a financial and economic standpoint, was a period of enormous activity, and at the same time a period of inconsistencies and uncertainty. Prices, of commodities and on the Stock Exchange, did not follow the courses confidently predicted for them at the beginning of the year. (See **PRICES**.) In this respect the year did not differ greatly from those years in the past which have followed exhaustive wars. The real conditions which had been caused by the war were

disguised by the unusual political and economic machinery necessarily created during the conflict. The economic exhaustion of belligerent Europe was greater than had been supposed a year before, though the process of recuperation made remarkable headway. (See **INDUSTRIAL RECONSTRUCTION**.) High prices, which, instead of receding from their war-time peaks, climbed still farther during 1919, were accompanied by increases in outstanding paper currencies. (See **BANKS AND BANKING**.) It was an era of extravagant personal expenditure, owing to abnormal war profits in some cases and abnormal war wages in others. Persistent demands for increase in the pay of labor were notable throughout the year; many of these took the form of strikes, which were settled only after government intervention. (See **STRIKES**.) Production in America was marked by hesitancy in the early part of the year, until it was seen that the slight fall in prices was only temporary, after which there was a rapid increase. A large increase in the volume of international trade was recorded, the release of shipping from transport service being an important factor. As a consequence of Europe's large trade indebtedness to the United States, and also of a further expansion of European paper currencies, a sensational depreciation of New York exchange on European markets was a feature of the year. Extensive gold exports by the United States to South America and the Far East, accompanied by extravagant speculation on the Stock Exchange, with its consequent drain on our Federal Reserve resources, resulted in a general tightening of all money markets. The harvests of the world, although estimated as a whole to be larger than in 1918, were hardly sufficient to prevent a continuance of scarcity and famine in Europe, despite the record-breaking exports of America. As was to be expected, all former belligerent states showed a substantial reduction in public expenditures, America's disbursements (exclusive of loans to allies) decreasing from \$13,000,000,000 in 1918 to \$9,700,000,000 in 1919. Great as were its records in trade and finance, the year ended with a great number of grave problems in the economic and political fields waiting to be solved. Not the least of these was the American railroad situation, since the uncertainty as to the exact status of the roads after war-time government operation had been a depressing influence in the investment world.

STATISTICS. The output of iron in the United States during 1919 was 29,250,000 tons, according to the *Iron Age*. This was about 9,000,000 tons less than the total for any of the three preceding years. The low monthly record for 1919 was 1,864,000 tons in October, the lowest figure since 1915. The unfilled tonnage figures of the United States Steel Corporation reached a maximum of 8,265,000 tons in December, an increase of 886,000 tons over December, 1918. The May figure of 4,282,000 tons was the lowest since May, 1915, and may be compared with the record of 12,183,000 tons in April, 1917. The total value of farm crops was approximately \$14,092,000,000, or over \$1,500,000,000 above that for the previous year. Some of the important crops were valued as follows on December 1st: Corn, \$3,934,000,000; wheat, \$2,029,000,000; oats, \$896,000,000; barley, \$200,000,000; rye, \$119,000,000; cotton, \$1,977,000,000; hay, \$2,129,000,-

000. According to the preliminary estimate published jointly by the Bureau of the Mint and the Geological Survey, American gold production for 1919 was valued at \$58,489,000, a decline of about \$10,100,000 from 1918, and actually the smallest of any year since 1897. It may be compared with \$101,035,000 in 1915. Silver production was 55,285,000 fine ounces. Total foreign trade for the calendar year approximated \$11,886,000,000, at least \$2,000,000,000 greater than the amount for 1918. Imports were about \$3,904,000,000, an increase of a little over \$9,000,000 from the preceding year; exports were estimated at \$7,922,000,000, an increase of \$1,803,000,000 over 1918. The trade balance was thus approximately four billions, as compared with three billions in 1918. Gold exports increased from \$41,070,000 in 1918 to about \$372,000,000 in 1919, owing to the lifting of the gold embargo; gold imports were \$65,620,000 as compared with \$62,043,000 in 1918. Exports of silver for the first 11 months of the year were of the total value of \$208,426,000, and imports were \$79,725,000. Bank clearings for the entire country showed an increase of 25.6 per cent over 1918, indicating the increase in volume of internal business in the country. Bank clearings outside New York increased 18.1 per cent. Railroad gross earnings for the first 11 months in the year were (for 186 roads) \$4,731,000,000 as compared with \$4,485,000,000 for the same period in 1918, an increase of 5.5 per cent. The banking resources of the national system were \$21,615,000,000 on September 12th, while loans to foreign governments amounted to about ten billions at the end of the year.

BANK CLEARINGS. Bank clearings for the entire country for the 12 months aggregated \$417,520,000,000, a gain of 25.6 per cent over 1918. Every section of the country showed an increase. The large gain over 1918 and previous years was due partly to the expansion of business and partly to the remarkable rise in price levels. The Middle States showed the greatest increase over 1918, with 29.7 per cent; the Pacific section was next with 28.3 per cent; the South increased 21.5 per cent, the Middle West 17.8 per cent, other Western States 14 per cent, and New England 13.3 per cent. The aggregate clearings of principal cities were as follows, in millions of dollars: New York, \$235,803; Chicago, \$29,686; Philadelphia, \$22,095; Boston, \$17,903; Kansas City, \$11,223; St. Louis, \$8206; San Francisco, \$7286; Pittsburgh, \$7277; Cleveland, \$5482; Detroit, \$4504; Baltimore, \$4343; Atlanta, \$3290; New Orleans, \$3170; Cincinnati, \$3131; Richmond, \$3091; Omaha, \$3058; Los Angeles, \$2339; Minneapolis, \$2267; Seattle, \$2021. Buffalo, \$1655; Portland (Ore.), \$1653; Dallas, \$1631; Denver, \$1630; Milwaukee, \$1528; Memphis, \$1128; Houston, \$1118; St. Paul, \$966; Louisville, \$928; and Fort Worth, \$900.

The bank clearings of Canada were \$16,710,000,000, an increase of 21 per cent over 1918, and about 36 per cent over 1917. The total for Montreal was \$6,252,000,000, an increase of 29 per cent; for Toronto, \$4,252,000,000, an increase of 26 per cent; for Winnipeg, \$2,317,000,000, a decrease of about 2 per cent.

The London Bankers' Clearing House figures for the period from January 1st to Dec. 6, 1919, showed an increase over the same period in 1918 of £6,317,000,000, or 31.4 per cent.

MEN PROMINENT IN FINANCE DURING 1919

STOCKS AND BONDS. The year 1919 brought stock market speculation such as the country had never seen before. Total transactions on the New York board were 315,983,000 shares, eclipsing the previous high records of 265,577,000 shares in 1901 and 284,016,000 shares in 1906, both of which periods were marked by enormous speculative waves. The industrial group led the trading, some industrials representing the extreme of prosperity while the rails represented the extreme of poverty. A high record of 145 million-share days, during the year was made, to be compared with 17 such days in 1918 and the previous high record of 114 in 1906. There were six two-million share days, while on no occasion during 1918 or 1917 did sales exceed two million shares. There were six two-million share days in 1916, and 11 in 1901. The highest price paid for Stock Exchange membership during 1919 was \$110,000, as compared with a high of \$65,000 in 1918 and \$70,000 in 1917.

Dullness characterized the opening days of the market in 1919, and prices were at lower levels till the beginning of the buying movement in February, a movement which progressed with only one serious setback up to the first week in November. It was an infectious movement, which forced even the conservative issues up, especially as money was comparatively easy during most of the year, the so-called Money Committee having ceased to function in January. The fever of speculation reached its peak in May, in which month every full five-hour day showed sales of over a million shares. Sharp advances in call-money rates, together with a warning against speculation by the Federal Reserve Board, and a report of deficits in legal reserves for the first time since the organization of the Federal Reserve system, caused the wave to recede somewhat in June and July. A fresh buying movement began in September, when labor troubles seemed to be lifting, and this continued till early in November, when the market broke badly, call money going to 30 per cent, the highest rate since the panic of 1907. There were several discouraging features which kept prices at a low level till the end of the year. The coal strike and the situation in foreign exchange were chief among these; also, the delay in regard to the Peace Treaty, and the fact that many expected constructive foreign developments had not come to pass, acted as depressing influences on the market. The Federal Reserve Bank of New York advanced its rediscount rates on November 5th. Averaging the prices of 20 railroad stocks, the low for the year was on December 12th, at 73.63, as compared with a low for 1918 of 77.21. The high for the average of 20 industrials was reached on November 3d, at 119.62, as compared with a high for 1918 of 89.07. Total bond sales on the stock exchange were \$3,803,000,000 par value, nearly double the amount for 1918, and about four times the total for 1917. The total of \$674,561,000 for December was by far the largest monthly total in the history of the stock exchange. The high for the average of 40 bonds was reached on June 2d, at 79.05; the low on December 18th at 71.05. These figures compare with a high of 82.36 and a low of 75.65 in 1918. The uncertainty of the railroad situation made itself felt especially in the bond market; there was also an enormous amount of

liquidation in the Victory and Liberty issues, which led the market in amount of trading.

FOREIGN EXCHANGE. The foreign exchange market during 1919 was one of the sensations of the financial world. Such utter demoralization of the market as was seen in the latter part of the year was something heretofore unknown in the history of finance. On December 9th demand bills on London sold at \$3.65½ to the pound sterling, and within the same week francs sold at 11 87 to the dollar, and Italian lira at 13.60.

At the beginning of the year, all of the allied exchanges were still being stabilized under war-time provisions. In March, the French ceased supporting their exchanges, and soon afterward Great Britain made announcement through J. P. Morgan & Co. that it had followed suit. The removal of official support caused an immediate fall in all exchanges. The decline continued until August, when sterling had fallen to \$4.12¼ and francs had gone to more than eight to the dollar. Various plans were devised during the year for improving the situation, including the "Edge bill," which became a law in December (see **BANKS AND BANKING**), and the plan of H. P. Davison of J. P. Morgan & Co. Neither of these schemes accomplished much during the year, but there are hopes for improvement of the situation by this means during 1920.

Exchange dealings with Central European countries were resumed in April, cable communication being established between New York and Berlin on May 1st. This created a market for German marks, for the first time since March, 1917. These marks, which opened at about seven cents each in May, declined to about two cents each early in December, although definite quotations could not be established on account of the loose character of the market.

BUILDING. The great activity in building during 1919 presented a noticeable contrast with the previous year, when government restrictions on new building, together with the demand for labor, capital, and materials for war purposes, caused building operations to decline to surprisingly low figures. *Bradstreet's* returns from 120 cities showed a total of \$1,282,000,000, more than three times the amount in 1918 for the same number of cities. The aggregate was 81 per cent greater than in 1917, and showed an increase of 38.7 per cent over 1916, the previous high year. Building expenditures by quarter years for 1919 were as follows: First, \$118,422,000; second, \$324,260,000; third, \$433,573,000; fourth, \$405,763,000.

FAILURES. Three features stand out in the record of commercial failures for 1919, as showing the tremendous activity and prosperity of business during the year. The number of failures was the smallest in the 38 years in which *Bradstreet's* records have been kept; liabilities were the lightest since 1902; and the Business Mortality Rate (the ratio of failures to the number of concerns in business) was the smallest ever recorded. The total number of failures reported was 5550, a decrease of 40.5 per cent from 1918, the previous record low year. Total liabilities were \$112,233,000, as compared with \$138,756,000 in 1918, \$166,561,000 in 1917, and \$357,091,000 in 1914. Assets aggregated \$55,334,000, as compared with \$69,205,000 in 1918, \$84,790,000 in 1917, and \$197,170,000 in 1914. The failures for the year by quarters were as follows: First, 1550; second, 1311; third,

1290; fourth, 1399. By geographical divisions: New England, 662; Middle, 1307; Western, 1478; Northwestern, 447; Southern, 1039; Far Western, 617. Failures in New York City numbered 390. The failures represented only 0.30 per cent of the total number in business, as compared with the previous low record of 0.51 per cent in 1918, with 0.71 in 1917, 0.92 in 1916, and 1.02 per cent in 1915.

MUNICIPAL BONDS. The enormous activity of the year as compared with other recent years was also reflected in the municipal bond market, where the aggregate borrowings of states and municipalities for refunding and permanent improvements amounted to \$748,206,000, an increase of 185 per cent over the total of \$260,661,000 in 1918. This latter figure was much lower than previous years, other recent totals running as follows: 1917, \$444,932,000; 1916, \$495,903,000; 1915, \$492,590,000.

CANADA. Canada's first year of readjustment was one of activity and prosperity, from which it emerged still a creditor nation and richer than ever before. She had in an industrial sense got on her feet during the war, and in 1919 evinced a determination to stay there. As a result of the strong export demand for farm products, lumber, wood pulp, and paper, the country found itself busier than ever. Although trade with the United States showed a rather large excess of imports, and her foreign commerce showed a somewhat expected diminution, yet at the end of the year a good balance remained. Her home finance was sound, as shown in the 1919 Victory Loan, to which subscriptions were received for \$678,000,000, representing not the utilization of bank credits but the savings of the people. The great confidence of the American people in Canada is shown by the fact that American investments in Canada during the year amounted to \$225,000,000. Deposits in Canadian banking institutions at the end of 1919 were \$300 per capita, and since the signing of the armistice the banks have increased the number of branches 25 per cent. Prosperity was well distributed in the North and West, the principal exception being in Alberta and Saskatchewan, where the farmers lost a large part of their crops through drought. As in other countries the problem of international exchange is the one thing that makes predictions as to future prosperity uncertain.

Canada's foreign trade as computed for the 12 months ending November, 1919, was \$2,119,000,000 as compared with \$2,165,000,000 a year previous. Total exports were \$1,199,000,000 as compared with \$1,270,000,000 in 1918; total imports increased from \$895,000,000 to \$920,000,000. Bank clearings were \$16,710,000,000, as compared with \$13,674,000,000 in 1918 and \$12,469,000,000 in 1917. The assets of the chartered banks on November 30th amounted to \$3,100,000,000. Canadian field crops for 1919 amounted to \$1,453,000,000. This compares with \$886,000,000 in 1916. The total value of mineral products for the year is estimated to be \$167,000,000. The number of commercial failures was 629, by far the smallest number in recent years. Assets were \$7,440,000 and liabilities \$12,952,000, as compiled by *Bradstreet's*, New York.

GREAT BRITAIN. The end of 1919 found Great Britain struggling with a national debt approximately 10 times what it was in 1914. Through-

out the war, however, taxation had fortunately been far more drastic in England than elsewhere in Europe. A total tax revenue of £160,000,000 in 1914 compares with £763,000,000 in 1919, while total revenues showed an increase from £196,825,000 to £968,650,000 in the same years. Total expenditures, which were £209,193,000 in 1914, were £1,658,485,000 in 1919. In the matter of foreign trade, 1919 returns still showed a large excess of imports over exports (£670,000,000); in fact, total imports were by far the greatest ever recorded, amounting to £1,632,000,000, an increase of about 24 per cent. The fact that the adverse balance was slightly less than in 1918, however, showed that Great Britain was "coming back"; her total exports (including re-exports) of £963,000,000 showing an increase of 81.5 per cent over 1918. The acute shortage of labor in 1917 and 1918 was somewhat remedied in 1919, although the problems of fuel and transit became extremely burdensome on account of the labor unrest. Capital subscriptions were about four times as large as in 1918. As a result of the renewed openings for capital in all lines of commercial undertakings, securities on the stock market, with the exception of the speculative specialties, suffered an expected decline.

FRANCE. Perhaps nowhere (with the exception of the defeated central powers) was the burden of adverse foreign exchange felt more heavily in 1919 than in devastated France, where the franc, which commanded a premium practically everywhere before the war, was at such a disadvantage compared with the English pound and more especially the American dollar, that France could compete commercially with these countries on nowhere near an equal footing. Conditions in 1919 required an excess of imports over exports in a ratio of about 10 to one. Revival of production in the French industries was naturally a slow process, particularly on account of the scarcity of labor, but the French people undertook the task bravely. The year 1919, however, emphasized the fact that the recuperation of France would depend chiefly on the coöperation of her allies, particularly the United States.

GERMANY. With the heavy burdens imposed by the peace conditions staring her in the face, with a tremendous increase in internal debt since 1914, and with the German mark selling at an extremely low rate of exchange, Germany's problems of taxation and adjustment of credit relations in the future are enormous. She is further handicapped by a lack of raw materials with which to rebuild the export trade which she enjoyed before the war. Though information is not plentiful regarding industrial and financial conditions in the country, the opinion is held that there has been a recent awakening of the "will to work," which is one of the more hopeful aspects of the outlook for the future.

FINLAND. Formerly a Grand Duchy of the Russian empire, but proclaimed an independent republic, Dec. 9, 1917, and since recognized by most of the Powers (see below under *Government*); situated in the northwest of Europe on the gulfs of Finland and Bothnia. Capital, Helsingfors.

AREA, POPULATION, ETC. The area was given in 1915 at 125,689 sq. mi., but a later estimate places it at 144,240 sq. mi.; population (1915)

3,300,650. The urban population in 1915, was 512,226, and the rural, 2,788,424. Males numbered 1,643,207, and females, 1,657,443. The Finnish-speaking numbered 2,565,742; Swedish, 344,364. The great majority are Lutherans (3,297,783, in 1914). Helsingfors (with Sveaborg) was reported in 1915 as having 176,521 inhabitants, but an estimate of July, 1919, places the population at about 200,000. In 1915 Abo had 54,600 inhabitants; Tammerfors, 45,560; Viborg, 29,329; Vasa, 24,536; Uleaborg, 21,605; Kuopio, 17,587; Björneborg, 17,571. Marriages (1913) 17,785; births, 83,306; deaths, 52,205. The emigration in 1917 was 2773. There is one university, with 3478 students in 1916.

PRODUCTION. Rye, oats, barley, wheat, and potatoes are among the chief crops, and the butter and milk industries are important; but the great source of wealth is the forests, and saw-milling and paper-making are the leading industries. The largest and thickest of the forests are in the centre between the great lakes and the plain bordering the gulf of Bothnia, and the chief trees are pine, spruce, and birch. Forests make up 53.6 per cent of the total area. The state forests cover 30,741,998 acres and yielded an income in 1918 of about \$1,000,000, a figure which indicates that they have not been efficiently exploited. The giving over of forest lands to private ownership has within the last 20 years practically ceased. The harvest of 1915 was, in hectolitres: Wheat, 91,765; rye, 3,971,581; barley, 1,769,360; oats, 8,424,126; potatoes, 7,234,939; flax and hemp, 1205 tons. In 1915, horses (3 years of age) numbered 287,926, horned cattle (2 years of age), 1,149,798. The following information in regard to recent agricultural production is supplied by the U. S. Bureau of Foreign and Domestic Commerce, Dec. 20, 1919:

The harvests in 1918 were very small, owing, first, to disturbed labor conditions; second, to a dearth of horses caused by the civil war; third, to heavy and continuous rains at the end of the summer; fourth, to lack of fertilizers; and fifth, to the scant supply of agricultural machines. The last two conditions were, of course, the result of a complete cessation of foreign imports. There are no statistics for the production of butter in 1918, but considering the quantities delivered for controlled consumption (8,195,000 pounds) and the 1,153,130 pounds exported as compensation for imported grain and sugar, the amount may be estimated at 9,348,130 pounds. The growth of the butter industry in Finland has been so marked as to deserve special note. In 1887 Sweden took the greater part, 7,150,000 pounds; Russia, 5,500,000 pounds; Germany, 1,650,000 pounds; Denmark, 733,330 pounds, and England only a small quantity. But in 1894 Denmark was the principal purchaser, with 15,950,000 pounds, and England was next, with 7,700,000 pounds, while Russia took 2,730,000 pounds, and Sweden and Germany, 733,300 pounds each. Five years later, however, England became the chief consumer, taking 11,550,000 pounds, while Denmark took 8,065,000 pounds; Sweden, 1,100,000 pounds; Russia, 750,000 pounds; and Germany, 370,000 pounds.

One recent law will seriously affect agriculture—the law that allows the renter to buy his holding, or in case of a desire to continue his tenancy he is permitted to pay his rental in

money instead of being required to pay it in labor. As a result, the larger estates will lose their cheap labor; but it is hoped to offset this loss by a greater use of machinery. With ownership, the farmer tenants will become more interested in their work and will have the ability and an incentive to buy modern implements. The recent eight-hour labor law does not affect labor on the farm.

Agriculture will also be aided by the stipulated minimum prices guaranteed by the State and by the subvention of 10,000,000 marks (\$1,250,000) appropriated by the Diet for new lands during 1919, 1920, and 1921. At present all products of the farm are extremely high when compared with prices in other countries. It was hoped that the imports of grain from the United States during the summer of 1919 would bring them lower, but so far they have had no effect. The wages of farm laborers have not decreased but are continually rising. With the diversion of this labor to the expected rehabilitation and post-war industrial and trade prosperity, labor on the farms is expected to grow still more dear.

The continued depreciation of the Finnish mark has produced such an unfavorable foreign exchange that the necessary agricultural implements, as well as artificial fertilizers, have become very expensive. The great expense of importing fertilizers prevents the improvement of the farms, which became exhausted during the war. Until this difficulty is overcome, it will be impossible to raise agriculture to its former standard of productiveness.

The production of pulp and paper for 1911 to 1915 inclusive is shown in the following table:

Years	Mechanical pulp and wood-board Tons	Chemical pulp Tons	Paper Tons
1911	186,677	130,381	158,230
1912	216,401	137,850	167,138
1913	235,356	159,384	184,780
1914	220,569	153,035	180,135
1915	241,915	157,233	204,903

MINERAL PRODUCTION. The following ores are mined in Finland, or prospecting work concerning them is carried on: Copper, pyrite, iron pyrite, magnetite, galenite, and molybdenite. The principal copper mines are situated at Outokumpu, between Joensuu and Kuopio; Pitkaranta, on Lake Ladoga; and Orijärvi, west of Helsingfors. There are iron mines at Pitkaranta, Kolivaara, and Walimäki, on Lake Ladoga; and at Jussaro, on the coast west of Helsingfors. The Director of the Geological Survey of Finland states that there are extensive deposits of iron ore in Lapland.

In the eighteen-seventies gold was discovered in the north of Finland in the bed of the Ivaljoki, which empties into the Arctic. Gold washing since then has taken place regularly, but with inconsiderable results.

Only small quantities of ore were produced in 1918 because of the war and the high cost of labor. At Outokumpu, 12,000 tons of copper ore were mined; at Pitkaranta, 3000 tons of magnetite; at Tipasjärvi, 800 tons of iron pyrite; and at Otravaara, 1000 tons of iron pyrite.

Prospects are good for mining copper at Outokumpu, where there is a large ore body containing 6,000,000 to 8,000,000 tons of ore in sight, with 4 per cent of copper and 27 per cent of sulphur.

for 1915, 1916, and 1918. The Finnish mark was converted at par (\$0.193) for 1915 and 1916 and at eight marks to the dollar for 1918. Figures for values are not available for 1917.

Classes of articles	1915		1916		1918	
	Imports	Exports	Imports	Exports	Imports	Exports

The production of pig iron is carried on in 15 blast furnaces, 11 in eastern and four in western Finland.

FISHERIES. Some 7000 families in Finland are supposed to live by fishing. They have over 10,000 boats, all small, manned by two to four men. During 1918 the take was very large, owing to the lack of nearly all other kinds of foodstuffs. The total catch for a normal year immediately preceding the war averaged 23,000 tons, of which about 14,000 tons was from the sea, 8000 tons from the lakes, and 1000 tons from the rivers. More was probably obtained, as the reports are not complete. The largest part of the annual catch consists of Baltic herring, or "stromming," which amounted in 1918 to 9000 tons. The common herring, of which an enormous quantity was caught in the Baltic 300 years ago, is now rare. The small anchovy, which is termed "hvasshuk," has a certain importance in the southwestern portion of the country.

COMMERCE. The following information in regard to commerce and finance is supplied by the United States Bureau of Foreign and Domestic Commerce: Finland's foreign commerce in 1918 amounted to 687,619,548 marks. (\$85,952,443), of which sum 500,856,106 marks (\$62,607,013) represented imports and 186,763,442 marks (\$23,345,530) exports. The following table gives the classes of imports and exports entering into the trade of Finland and their value

There were no exports from Finland to the United States during 1918.

COMMUNICATIONS. No later figures for railways and shipping were available than those given in the preceding YEAR BOOK. Railway mileage in 1914 was 2506 of which all but 217 was owned by the State. The state operates the privately owned lines. There were 2464 post offices in 1916. Navigable waterways extend 2765 miles. Vessels navigating the canals in 1915 numbered 47,873. Merchant marine in 1915 comprised 3257 sailing vessels of 380,134 tons, and 564 steamships of 79,172 tons. Vessels entered in 1914, 8399, of 2,352,282 tons, and cleared, 8538 of 2,326,217 tons.

FINANCE. Owing to the revolutions in Russia and in Finland, the Diet was prevented from passing the budget at the usual time, and the budget for 1918, therefore, was adopted only at the end of that year. By that time the sums of most of the revenue and expenditure were already known, so that it was possible to calculate the amounts in close accord with the facts. The national income in 1918 did not suffice for the expenditures, and recourse was had to loans, the total amount of which was 530,000,000 marks (\$66,250,000). This was due to special and exceptional circumstances, which on the one hand increased expenditures and on the other hand diminished the revenue. The revenues and expenditures in 1918 were as follows:

Revenues	Marks	Dollars	Expenditures	Marks	Dollars
Ordinary revenue	387,248,400	48,406,050	Ordinary expenditure . .	654,616,406	81,827,051
Extraordinary revenue:			Ordinary grants	754,160	94,270
Special taxation	150,000,000	18,750,000	Extraordinary expenditure	455,576,033	56,947,004

GOVERNMENT. Under the constitution as modified in 1906 the Diet consists of a single chamber with 200 members chosen by direct and proportional election by all citizens, men or women, of 24 years of age or over. After the accession of the Bolshevik government in Russia the Finnish Diet, as noted above, proclaimed the country an independent republic (Dec. 9, 1917) and independence was recognized by Russia, Sweden, Norway, France, Spain, Denmark, and Germany, in the order named on the understanding that an arrangement be reached between Finland and Russia in regard to formal reparation. Other Powers including the United States also recognized the new republic. Civil war followed during the early months of 1918 between the "White" and "Red" forces, resulting in the triumph of the former (see preceding YEAR BOOK). General Baron Gustaf Mannerheim was chosen regent. Elections in the Diet were held in March, 1919, resulting in the following distribution of seats by parties: Social Democrats, 80; Coalition party, 28; Progressives, 26; Agrarians, 42; Swedish party, 22; Christian Labor party, 2. The Cabinet, appointed in April, 1919, was composed as follows: Prime Minister, Mr. Kaarlo Castrén; Minister for Foreign Affairs, Dr. Eino Rudolf Woldemar Holsti; Minister of Finances, Dr. August Ramsay; Minister of Education, Dr. August Mikael Soininen; Minister of Justice, Dr. Karl Gustaf Söderholm; Minister of Interior, Colonel C. Voss-Schraeder; Minister of War, Colonel Karl Rudolf Walden; Minister of Commerce and Industries, Dr. Juho Heikki Vennola; Minister of Communications and Public Works, Mr. Eero Eikko; Minister for Food Supplies (temporary office), Mr. Kaarlo Juhan Mikael Collan; Minister of Agriculture, Mr. Kyösti Kallio; Minister for Social Affairs, Mr. Santeri Alkio; Minister without Portfolio, Mr. Mikko Luopajarvi.

HISTORY. In December, 1918, the dictator, Svinhufvud, resigned along with his prime minister and was succeeded by General Mannerheim, the organizer of the Finnish White Guard who became Regent and as such practically had dictatorial power. After completing the task of ridding the country of Bolshevik activities, he directed his efforts against the Russian Reds. The Finns claimed a considerable part of the Russian borderland from the Murmansk and Karelian coasts down to the Gulf of Finland, and it was thought if Russia continued in its present condition Finland and Estonia might unite into a single state including Petrograd. The party in favor of this forward policy including a campaign against Petrograd and an increase of Finland's territory and power, while serving as a protector of Europe against the Bolsheviks, seems to have gained the upper hand. But on July 25th Professor K. J. Staahlberg was elected president of the republic over his opponent General Mannerheim by a majority of

143 against 50, his majority being made up of the bloc formed by the Socialists, Agrarians, and Progressives. This indicated a turn to a more liberal policy. M. Staahlberg had been professor of law at the University of Helsingfors, had served as a member of the Diet to which he was returned again in March, and he had been several times a member of the cabinet. During the debates of 1918, when the question of a republic was under discussion, he was on the side of the republicans, and hence at that time opposed to the German interests, which favored a monarchy as certain to result in the choice of a German ruler. As a deputy in the Diet he belonged to the Young Finn party which had been for the most part monarchists, but he argued that Finland was in effect a republic and in this he was followed by the Old Finns, and some of the members of the Young Finn party who formed themselves into a Progressive party in opposition to the monarchists; and he conducted a campaign in the leading Finnish newspaper against the monarchists. General Mannerheim who had been retained after the month of September, having put down the revolution, lost the control as the result of the March elections in which, at the advice of the Allies, Socialists had been permitted to stand for election to the Diet. Serious questions both external and internal, had to be settled, such as the affair of the Aland islands and of Karelia. Moreover a corps of Finnish volunteers was still fighting in the region of Olonetz. The Socialists, who with the Agrarians constituted a majority of the Diet, regained their former ascendancy. There was an agitation on the part of the Swedish-speaking Finns in spite of the privileges granted them by the constitution, and German propaganda was said to be secretly carried on. The financial situation was bad, although it appeared that the rate of exchange might become favorable if the exportation of Finnish currency to the United States and England were permitted. M. Staahlberg was regarded as a thorough nationalist, and was said to have the confidence of the Finns. According to the republican constitution which was referred to the Diet in May, and carried soon afterwards, receiving the sanction of General Mannerheim in August, the term of the president was for six years. The president has the right of veto, but this cannot be exercised the second time for a measure voted anew by another Diet.

FIRE INSURANCE. See INSURANCE.

FIRE PROTECTION. Municipal authorities, and especially their fire departments, along with fire insurance and other interests in 1919 naturally endeavored to restore fire protection and fire prevention to at least pre-war conditions. In the fire departments of the different cities of the United States many of the members had been in military or naval service and in not a few cities neither funds nor facilities were

available to carry out necessary schemes of equipment or extension. However, everything possible was done to cope with conditions and, with much of the high hazard war work eliminated, fire and insurance matters tended to resume their natural course which in the main is indicated by the accompanying tables.

It must be understood however that the matter of value was an important element in 1919 and that not only was the increased value of property on a basis different from that of previous years but that losses must be considered in the same light, and that where they have been kept below those of previous years there was a great gain. Especially was this true in view of the larger exposure produced by enhanced values and new construction, and the fire underwriters were led to believe that the work they had been doing for fire prevention was beginning to bear fruit. Another characteristic of the fire prevention campaign in 1919 was that the number of fires of suspicious origin included in what is known as the "moral hazard," was reduced to a remarkably low point, due it was true to the ease and high prices that attended the disposal of stocks of goods at large and quick profits.

IMPORTANT FIRES. The accompanying tabula-

Location—Description	Amount
Stamford, Conn., dye extract plant . . .	\$1,250,000
New York Harbor fruit ship and cargo . .	1,500,000
Bernard, N. C., tanning works . . .	1,000,000
Mobile, Ala., electric power plant and other	1,000,000
Atlanta, Ga., freight station and 80 carloads food	1,000,000
Aberdeen, Md., government proving grounds buildings . . .	1,000,000
Cedar Rapids, Ia., starch works . . .	3,000,000
Norfolk, Va., tobacco warehouse . . .	3,250,000
Detroit, Mich., factory plant, lumber and hotel	1,675,000
Port Colborne, Ont., government grain elevator	1,800,000
Superior, Wis., sack storage plant, . . .	1,000,000
Rock Island, Ill., tractor factory . . .	1,500,000
Sheffield Ala., nitrate plant warehouse . .	2,000,000
Big Horn, Wyo., forest fires . . .	1,300,000
Long Island City, oil works and other . . .	4,250,000
Omaha Neb., court house building . . .	1,100,000
Waggoner City, Texas, business section . .	1,000,000
Eldorado Ark., cotton compress . . .	1,000,000
Toledo Ohio, wagon and auto body factory	1,000,000
Westfield, Pa., tannery plant . . .	1,000,000

The total number of outbreaks of fire during 1919 which, in each instance, resulted in an estimated property damage of \$10,000 or over, was 2904, as compared with 2943 such fires in 1918. The accompanying table gives the fires of \$10,000 and a comparison with the fires of the 10 preceding years:

NUMBER OF FIRES 1909-1919, CLASSED AS TO ESTIMATED PROPERTY LOSS
(From *Journal of Commerce*)

	\$10,000 to \$20,000	\$20,000 to \$30,000	\$30,000 to \$50,000	\$50,000 to \$75,000	\$75,000 to \$100,000	\$100,000 to \$200,000	\$200,000 and over	Total
1919	855	516	411	326	171	357	268	2,904
1918	906	527	387	325	171	359	268	2,943
1917	1,031	581	427	356	164	340	251	3,150
1916	1,041	551	371	351	124	311	208	2,857
1915	1,198	590	413	375	138	201	147	3,152
1914	1,233	667	485	406	182	336	193	3,502
1913	1,298	695	492	416	182	355	184	3,590
1912	1,278	689	514	433	162	396	168	3,640
1911	1,159	596	525	402	178	352	189	3,410
1910	1,098	594	450	371	196	324	192	3,225
1909	1,128	570	457	444	174	337	160	3,275

tion from the *Journal of Commerce* (New York) indicates the most important fires taking place in the United States in 1919. Of these the oil fire at Greenpoint, New York City was the most serious. On Sept. 13, 1919, a fire broke out among the tanks of the Standard Oil Company's Kings County Refinery at Greenpoint on the banks of Newtown Creek, just off the East River, New York City, and continued for several days, causing a loss estimated at over \$4,000,000. Other large individual fires during the year 1919 were those in Savannah, Ga., involving \$4,000,000 value; Cedar Rapids, Ia., involving \$3,000,000, and Norfolk, Va., \$3,250,000. Altogether there were 27 fires during the year, each of which resulted in an estimated property loss of a million dollars or over. A list of these large fires is given herewith:

Location—Description	Amount
Pittsburgh, Pa., Film Exchange building . .	\$1,000,000
Montreal, Que., automobile factory and business houses . . .	1,000,000
Philadelphia, Pa., oil tanks, steamers, and barges . . .	1,000,000
Sioux Falls, Ia., office, building and stores .	1,000,000
River Point, R. I., textile mill plant . . .	1,250,000
Nyack, N. Y., aniline products plant . . .	1,000,000
Savannah, Ga., fertilizer factory, cotton and railroad terminals	4,000,000

AMERICAN FIRE LOSSES IN 1919. The total loss by fire in the United States and Canada during the year 1919, as recorded and summarized in the *Journal of Commerce and Commercial Bulletin* (New York) reached the total of \$269,000,775. This compares with \$317,014,385 the year 1918 and \$267,273,140 for the year 1917. The figures of 1919's estimated property loss by fire represented an enormous economic waste of the wealth of the country and had only been exceeded twice previously, in 1918 and again in 1906, when the San Francisco conflagration raised the annual loss figures to \$459,710,000. The reduction of \$48,013,610 in 1919 from 1918 was particularly gratifying, for with the higher valuations prevailing it represented a much greater decrease than the figures alone would indicate.

The fire losses for 1919 bring the total fire losses for the 41 years from 1879 up to the startling aggregate of \$7,031,966,820, or a yearly average for the entire period of \$171,511,386. In comparing this yearly average with last year's record *The Journal of Commerce* reminds its readers that in earlier years the total valuation of property exposed to fire hazards was only a fractional part of the present valuations.

FIRE LOSSES IN U. S. AND CANADA, 1879-1919

1919	\$269,000,775	1899	\$136,773,200
1918	317,014,385	1898	119,650,500
1917	267,273,140	1897	110,319,650
1916	231,442,995	1896	115,655,500
1915	182,836,200	1895	129,835,700
1914	235,591,350	1894	128,246,400
1913	224,728,350	1893	156,445,875
1912	225,320,900	1892	151,516,000
1911	234,337,250	1891	118,764,000
1910	234,470,650	1890	108,893,700
1909	203,649,200	1889	123,046,800
1908	238,562,250	1888	110,885,600
1907	215,671,250	1887	120,283,000
1906	459,710,000	1886	104,924,700
1905	175,193,800	1885	102,818,700
1904	252,554,050	1884	110,108,600
1903	156,195,700	1883	110,149,000
1902	149,260,850	1882	84,505,000
1901	164,347,450	1881	81,280,000
1900	163,362,250	1880	74,643,400
		1879	77,703,700
Total for 41 years			\$7,031,966,820

The losses for the year 1919, month by month, as compared with the monthly record of the two preceding years, 1917 and 1918, are given herewith:

	1917	1918	1919
January	\$36,431,770	\$37,575,100	\$29,446,325
February	29,587,600	20,688,155	26,891,950
March	17,523,000	20,213,980	22,201,900
April	18,597,225	20,108,900	15,484,750
May	21,968,800	20,545,900	16,516,300
June	15,513,270	24,890,600	20,475,750
July	16,143,050	24,537,000	20,198,600
August	21,751,100	31,176,650	24,526,000
September	13,814,490	13,434,300	29,083,500
October	26,384,450	75,412,300	13,358,400
November	20,198,025	12,333,750	23,450,800
December	26,360,300	15,737,750	27,366,500
Year	\$267,273,080	\$316,954,385	\$269,000,775

STATISTICS OF FIRES. The Committee on Statistics and Origin of Fires of the National Board of Underwriters presented its annual report on May 22, 1919. From this report there has been abstracted, as usual, statistics of fires in the larger American cities for the year 1918.

In 1918 35 American cities had a per capita fire loss in excess of \$5, Burlington, Vt., heading the list with \$21.74. This can be compared with 29 in 1917. One city, Fresno, Cal., was on this list for four of the last five years, three cities for three of the last five years, and eight cities for two years of the same period. The 1918 figures are given herewith.

CITIES IN WHICH LOSS EXCEEDED \$5 00 PER CAPITA 1918

Burlington, Vt.	\$21.74	*Des Moines, Ia.	\$7.11
Fort Smith, Ark.	19.79	Indianapolis, Ind.	7.06
Lima, Ohio	16.52	Pawtucket, R. I.	6.46
Kansas City, Mo.	12.86	Danbury, Conn.	6.45
*Orwego, N. Y.	12.76	Newark, N. J.	6.42
†Port Huron, Mich.	12.18	Findlay, Ohio.	6.36
Canton, Ohio	11.33	*Jersey City, N. J.	4.19
†Fresno, Cal.	10.72	*Wheeling, W. Va.	6.12
Hoboken, N. J.	10.47	San Antonio, Tex.	6.01
Revere, Mass.	8.76	*Little Rock, Ark.	6.00
Eau Claire, Wis.	8.68	Walla Walla, Wash.	5.91
*Duluth, Minn.	8.52	*Saginaw, Mich.	5.55
Leominster, Mass.	8.23	Chattanooga, Tenn.	5.44
Memphis, Tenn.	7.93	Beaumont, Tex.	5.36
†Norfolk, Va.	7.72	Somerville, Mass.	5.26
Johnstown, Pa.	7.71	*Williamsport, Pa.	5.20
Bloomington, Ill.	7.34	Tulsa, Okla.	5.08
†Charlotte, N. C.	7.34		

* These cities in this class in two of the last five years.

† In this class three of the last five years.

‡ In this class four of the last five years.

Another interesting table is that giving the comparative fire losses for five years in which actual figures for cities are compared with the statistics covering the entire country. In 1918 compilation figures for 328 different cities were duly summarized.

STATISTICS OF FIRES IN AMERICAN CITIES, 1918

	Area Sq. miles	Population	No. of Alarms	Total No. of fires	Confined to building or place of origin	Total loss	No. of fires per 1000 popu- lation	Loss per capita
New York	311.75	5,872,143	15,788	13,971	13,743	\$9,538,725	2.38	\$1.63
Chicago	199.37	2,621,419	17,665	11,206	10,895	5,368,610	4.27	2.02
Philadelphia	129.75	1,800,000	5,771	4,831	1,677	4,339,714	2.68	2.41
St. Louis	61.37	850,000	4,640	3,442	3,309	2,518,242	4.04	2.96
Detroit	79.62	850,000	4,549	4,019		2,632,031	4.72	3.09
Boston	47.81	796,310	5,138	4,641	4,590	2,827,612	5.83	3.55
Cleveland	60	750,000	3,934	3,344		1,861,444	4.46	2.41
Baltimore	33.66	650,000	2,446	2,370	2,357	648,222	3.65	.99

* Estimated † Actual figures reported.

FISCHER, EMIL. German scientist, died July 6. He was born in Rhenish Prussia Oct. 9, 1852, and devoted himself to the study of organic chemistry in which he rapidly won distinction. In 1874 he completed an investigation on the coloring matters and he became one of the leading organic chemists soon afterwards with his discovery of phenylhydrazine. In 1878 he was promoted to the rank of extraordinary professor in the university of Munich and he began investigations into the constituents of coffee and tea which resulted in the development of an entirely new branch of chemistry. His subsequent researches and successes are briefly summarized in the *Science*, August 15. He received the Nobel prize in 1910.

FISHERIES. See ALASKA.

FISK UNIVERSITY. A co-educational institution for negroes, located at Nashville, Tenn. The enrollment for the fall of 1919 was 515, while there were 43 members on the teaching staff, nine being new this year. The income for the year was \$252,468. The library contains about 12,000 volumes. In 1919 the customary education work of the university was resumed after the cessation in 1918, due to lack of instructors caused by the war. The music department has had in 1919 a great increase in pupils. Fisk was founded in 1866. President, Fayette Avery McKenzie, LL.D., Ph.D.

FLAX. The flaxseed crop of most of the world's principal flax producing countries in the northern hemisphere in 1919 was smaller than in 1918 and was also below normal. According to provisional figures published by the International Institute of Agriculture, Rome, the crop in British India was about 9,167,000 bushels or less than half of the production in the preceding year and also less than half of the average crop for the five years 1913 to 1917, inclusive. The Canadian yield of 7,373,900 bushels was over 20 per cent above the preceding yield but still about 25 per cent below the five-year average.

In the United States, according to data given out by the Department of Agriculture, the crop was only 8,919,000 bushels, the smallest on record for years, as the result of a severe drouth during the growing season in North Dakota and Montana, the principal flaxseed producing States. In 1918 the yield was 13,369,000 bushels and the average yield for 1913 to 1917, inclusive, was 13,818,000 bushels. The area devoted to flaxseed culture in 1919 was 1,683,000 acres as compared with 1,910,000 acres in 1918 and 1,756,000 acres, the average area for the five-year period. The average yield per acre was only 5.3 bushels or 1.7 bushels below the average acre yield of the preceding year and 2.6 bushels under the five-year average. The farm price on December 1st, 438.9 cents per bushel, was the highest on record and on this basis the total value of the crop was \$39,145,000 which stood next to the record value of \$45,470,000 in 1918.

The low yields in the United States and in British India were largely the cause of the unusually high prices of linseed oil which prevailed. The Argentine flaxseed crop harvested early in 1919 amounted to 27,754,000 bushels. Data on the world's flax fibre crop were not available.

FLETCHER, HORACE. Writer, lecturer, and diet expert, died at Copenhagen, Denmark, January 13. He was born at Lawrence, Mass., Aug. 10, 1849, educated at Dartmouth and became

an extensive traveler and engaged in many occupations, but after 1895 devoted himself to the study of sociology and scientific research in human nutrition. He made investigations in the physiological laboratories in the universities of Cambridge, England, and Yale, and was the author of the system known as Fletcherism which had a wide following throughout the world. He was the author of the following: *A B C of Snap-Shooting; Menticulture; Happiness; That Last Waif, or Social Quarantine; Nature's Food Filter, or What and When to Swallow; Glutton or Epicure; A B-Z. Our Own Nutrition; Optimism—A Real Remedy; Fletcherism, What It Is; Die Essucht* (German); works translated into Italian, Hungarian, Polish and Russian.

FLETCHER, LIEUT.-COL. WILLIAM ALFRED LITTLEDALE. A well-known British oarsman, died at Liverpool, February 14. He was placed by many as the best of the heavy weight oarsmen of his time. For several years at Henley he won every event for which he entered. He traveled widely in the East. He distinguished himself in the South African War and during the late war he was in command of a Liverpool regiment in France.

FLOOD PREVENTION. Since 1913 when the great Ohio Valley floods occurred in the Middle West of the United States, the YEAR BOOK has recorded the progress made in measures and projects for protection from this great menace. The importance of such actions had been realized in some quarters for many years but it required the great loss of life and property experienced in 1913 to start in earnest remedial measures.

By 1919, however, in a number of regions flood protection and measures to that end had passed distinctly beyond the legislative and design stage and construction was in progress notwithstanding shortage and high cost of labor and post-war conditions of finance and materials. Accordingly a summary of some of the more important work in progress at the end of 1919 is of interest and certain features will receive more extended treatment in subsequent paragraphs.

In Ohio at the Miami Conservancy District the scheme involving detention reservoirs and channel improvement amounting on a pre-war estimate to over \$25,000,000, was well under way and was the most extensive of the American works in this field. Columbus, Ohio, was seeking a measure of protection at a cost of \$3,500,000 by enlarging the channel of the Scioto River within the city. Erie, Pa., had received additional protection against floods from Mill Creek (see YEAR BOOK for 1918). Augusta, Ga., had constructed a levee system protecting against floods from the Savannah River at a cost of \$2,000,000, the work having been in progress since 1914. At Kansas City, Kan., the Kaw Valley Drainage District had made important improvements of the channel of the Kansas River within the city by building levees and reconstructing bridges whose piers restricted the channel. This like other flood protection projects was attended by several years of litigation and the voters had not seen fit to authorize bond issues in sufficient amounts to secure adequate protection by completing the works called for in the engineers' plans. The city of St. Louis was preparing to control the floods of the river Des

Peres at the southern part of the city by suitably inclosing the river. In passing through the city it drains about 110 square miles, most suburban and rural districts and in flood was estimated to afford a run-off of 40,000 sec. feet. In East St. Louis studies referred to below were completed during 1919 and represented important improvements.

Other cities in the Middle West awoke to the importance of their flood dangers and it was found in some cases that comparatively slight expenditures would provide some protection. Thus at Decorah, Iowa, it was proposed to build a small detention dam which would afford protection against floods from Dry Run. Likewise at Council Bluffs, Iowa, a small stream from the hill country passing through the business district of the city had proved a source of damage and expense by overflowing at periods of high water. Accordingly plans were completed in 1919 whereby protection would be secured by the construction of works amounting in cost to about \$1,000,000.

Such work was typical of a general movement to study flood conditions and to eliminate possible points of danger. Faulty planning of cities through which streams pass, encroachments on river channels either by bridge piers or buildings on the banks, have been responsible in large measure for continual danger and damage in many cities and towns in addition to the natural hazards of sudden floods. By the construction of dams or dikes forming detention basins or reservoirs to hold flood waters, and the proper control of channels or banks, as well as providing emergency channels, it was realized that much protection could be secured. Everywhere engineers were becoming more interested in flood and drainage studies and investigations, particularly where floods produced serious and annual damage. It was a tendency in this field to secure additional information through rain gauges and stream gauges records, not only in the larger drainage areas but also in the smaller districts. Such data would be most welcome not only for local improvement but also in large projects involving State participation and authority.

MIAMI FLOOD WORKS. One of the features of the flood protection project for the Miami Valley in Ohio was the relocation of railways, and the railways crossing the flood retarding basins were being removed several miles and lifted above the reservoir flow lines. Where complete clearance was impracticable, parallel levees were being built to embrace the roadbed and isolate it from the flood waters on both sides. Long culverts under levees and roadbed were designed to keep the water level on both sides and equalize the pressure. Of the five retarding basins only two interfered with railway lines seriously and involved major railway changes. At the retarding basin at Huffman and at Taylorsville some 55 miles of trackage changes were in progress, involving approximately 40 miles of new roadbed over 100 culverts and bridges, 500,000 cubic yards of levee, 1,500,000 cubic yards of cut, and 1,300,000 cubic yards of fill. At the Huffman retarding basin the Erie Railroad, the Cleveland, Cincinnati, Chicago, & St. Louis Railway, and the Ohio Electric Railway running out of Dayton traversed the dam site and retarding basin wall at Taylorsville. The Baltimore and Ohio Railroad passing by the west edge of the reservoir within the flow line of maximum flood was re-

located by building a new line higher up on the valley. The lines of the four railways mentioned were included in property condemned because it either interfered with the control works under construction or was in the district subject to possible inundation, and as a result new lines were reconstructed which involved considerable mileage both up and down stream in order to secure satisfactory approach grades to the higher level. The expense of this relocation was estimated to amount to about \$4,000,000, though the railways were assessed for benefits that would accrue from the decrease of flood hazards, and adjustment was made in case the lines were either lengthened or shortened. For example, in the case of the Baltimore & Ohio, a more favorable relocation was secured, for which the railway made corresponding allowance. All of the construction is modern, including concrete bridges and levees where necessary for protecting the tracks which were being built. The new construction was started in April, 1918, and was to be finished early in 1920.

An important step in the Miami Flood Protection System was the closure of the Twin Creek Valley, 15 miles southwest of Dayton, Ohio, by the earth embankment of the Germantown dam. This dam is to be an earth embankment of 107 feet maximum height and 1210 feet length, pierced by a permanently open twin outlet conduit, of which each half has an arch section 9.5 by 12.3.

COLUMBUS, OHIO, FLOOD PROTECTION. Flood protection works for Columbus, Ohio, designed to fit an appropriation of \$3,500,000, were under way during 1919. This work contemplated widening and rectifying the channel and bridge construction, but was not designed to secure full safety from such maximum floods as that of March, 1913, when a volume of water measuring 140,000 cubic feet per second passed. The safe capacity of the channel under construction was 100,000 second feet, and the ultimate or calamity capacity was 125,000 second feet. The plan under execution in 1919 followed action by the Columbus City Council early in 1917, after a popular vote at the preceding November election had decided in favor of a \$3,500,000 bond issue. Contracts were awarded late in 1917 and early in 1918, and the enterprise was put under way under the direction of the Department of Public Service. The improvement of the Scioto River at Columbus was to give the largest capacity flood channel by excavation, levee construction and new bridges. The excavation was to be carried to the depth of the bed of the old channel except on the west side, between Broad and Rich Streets, where a bench averaging 150 feet in length was to be left from 2 to 3 feet above normal low water. The plan permits deepening the channel so as to increase the capacity some 20,000 second feet without further widening. The channel construction involved wrecking and clearing, excavating and levee building, a concrete spillway, retaining wall and weir, and concrete revetment. This work demanded the raising of some 200 buildings and the purchase of about 250 parcels of land. The excavation was chiefly on the west side of the river, and from the material heavy embankments or levees were built with a top width of 80 feet, on which would be laid out in the future a boulevard. The concrete construction involved the building of a levee spillway wall 1200 feet long and from 25 to 30 feet

high and of a shorter retaining wall running some 700 feet north from the Hocking Valley Railroad bridge, and of a concrete weir across the river at about the same point.

EAST ST. LOUIS PROJECT. For the removal of drainage waters and the control of storm waters through the lowlands on the east bank of the Mississippi River, Ill., opposite St. Louis, Mo., an important plan of protection works was prepared during the year and submitted to the East Side Levee and Drainage District. In this territory the land known as the American Bottoms underwent periodic flooding from the Mississippi River and from storm waters from numerous streams which flowed down from the heights on the eastern boundary of the bottoms. Accordingly the protection district of about 96 square miles was organized, and various works were built in the way of increased channels to carry off flood waters, together with a system of levees. This drainage district is remarkably valuable, as it includes a group of seven cities and extensive railway manufacturing interests, with about 90 per cent of its area in farm land, much of which is useless on account of insufficient drainage. The population in 1919 was about 140,000, and was increasing, so that it would reach 400,000 by 1950. The city of East St. Louis, Ill., in 10 years had become the second city in the State. The plan submitted in 1919 was devised to deal with storm waters from 81 square miles of drainage area in the hills and 99 miles of drainage from the bottoms, which ordinarily find outlet through Cahokia Creek and Prairie du Pont Creek. The report recommends the drainage of the northern part of the district, the elimination of the nuisance from stockyard waste by the construction of a reinforced concrete conduit 6600 feet long to extend east from Cahokia Creek to the river, with three channels 12 feet in diameter, and a combined flow capacity of 2000 second feet. At the river end there would be controlling gates and a pumping station. For the southern section of the district it was proposed to enlarge and extend the existing main ditch, connecting it with two lakes and providing an outlet of 1000 second feet capacity through the Prairie du Pont levee near the St. Louis & Iron Mountain Railroad. At this point there would be a pumping plant having a capacity of 500 second feet. The estimated cost of these improvements was \$2,284,000, and the centrifugal pumps of the largest possible size would be used, operated by electricity. This report with map is summarized in the *Engineering News-Record* for Oct 30, 1919.

COLORADO RIVER FLOOD PROTECTION. On the lower Colorado River, the Palo Verde Joint Levee District had completed by the summer of 1919 about 13 miles of new levee and had standardized work on the old levees. Quarries were opened for revetment work which was to be undertaken, and the district had voted \$1,285,000 for railroad track over the entire levee system totaling 34 miles in length. This was to be laid as part of the season's construction work after the river flood for the year had subsided. See also HURRICANES.

FLORIDA. POPULATION. The population of the State in 1910 was 752,619, while on July 1, 1919, it was estimated, by the Federal bureau, to be 961,569, a gain during the 12 months of 22,000. The State census of 1915 returned a total of 921,618.

AGRICULTURE. The following table is compiled from a report of the Federal Department of Agriculture, for December, 1919.

Crop	Year	Acreage	Prod. Bu.	Value
Corn	1919	840,000	12,600,000	\$17,640,000
	1918	800,000	12,800,000	17,664,000
Hay	1919	113,000	a 141,000	8,243,000
	1918	105,000	a 120,000	2,220,000
Peanuts	1919	126,000	3,402,000	7,178,000
	1918	153,000	5,202,000	8,011,000
Tobacco	1919	4,200	b 3,990,000	2,175,000
	1918	4,600	b 4,416,000	2,031,000
Potatoes	1919	24,000	1,824,000	3,830,000
	1918	35,000	3,500,000	7,000,000
Sweet Pota	1919	41,000	4,100,000	5,740,000
	1918	36,000	3,960,000	4,950,000
Cotton	1919	117,000	c 17,000	3,570,000
	1918	167,000	c 29,000	6,324,000

FINANCE. The report of the Treasurer of Jan 1, 1920 shows the following facts concerning the financial condition of the State. Balance on hand, Jan. 1, 1919, \$1,861,628, receipts during the year, \$6,334,025; disbursements during the year, \$6,369,753; balance on hand, Dec. 31, 1919, \$1,825,899. The public debt consists solely of refunded bonds amounting to \$601,567, bearing interest at the rate of 3 per cent per annum, all of which are held by the Educational Funds of the State.

CHARITIES AND CORRECTIONS. The following are the institutions maintained by the State: Institute for the Deaf, Dumb, and Blind, at St. Augustine; Hospital for the Insane, at Chattahoochee; Industrial School for Boys, at Marianna; Prison Farm, at Raiford; Industrial School for Girls, at Ocala. On Dec 31, 1919, the population of the Prison Farm was 463; the expenses for this institution during the year amounted to \$188,988.

JUDICIARY. Supreme Court: Chief Justice, Jefferson B. Browne; Associate Justices, James B. Whitfield, Thomas F. West, W. H. Ellis, R. F. Taylor.

OFFICERS. Governor, Sidney J. Catts; Secretary of State, H. Clay Crawford; Comptroller, Ernest Amos; Treasurer, J. C. Luning; Superintendent of Public Instruction, William N. Sheats; Auditor, J. Will You; Attorney-General, Van C. Swearingen. See CHILD LABOR.

TRANSPORTATION. The total mileage of the State was, in 1919, 3960; of this over 17 miles was constructed during the year. The chief roads are the Atlantic Coast Line, the Seaboard Air Line, and the Louisville & Nashville.

FLORIDA, UNIVERSITY OF. A State institution of higher education, at Gainesville, Fla. In the summer session of 1919 there were 612 students, and in the fall, 604. The faculty numbered 62. The Seminary Interest Fund is \$2064. The library contained 25,500 volumes. A new gymnasium was recently completed at a cost of \$25,000. President, Albert Alexander Murphree, LL.D.

FLOUR. See AGRICULTURE.

FOOD. See articles on agricultural subjects and FOOD AND NUTRITION.

FOOD AND NUTRITION. Food remained one of the world's great problems throughout the year. Its high cost was again a heavy burden in every civilized country, and in war-devastated Europe. While the months following the signing of the armistice brought relief and en-

couragement, the outstanding question was still the actual sufficiency of the food supply. War-time regulations and restrictions were removed to some extent, especially in the nations of western Europe, but despite unprecedented exports from the United States and other western nations conditions were far from normal. At the close of the year millions throughout central and eastern Europe, as well as in Armenia and other districts in Asia, were facing another winter under virtual famine conditions.

FOOD SITUATION IN THE UNITED STATES. For the United States the return of the American Expeditionary Forces from Europe eliminated the vital military problems of the war period. Despite the tremendous needs of Europe, the food supply of the nation was once more available, first of all for domestic use and, except for the one commodity sugar, no question arose as to its adequacy. The policy of food regulation was largely abandoned. The few restrictions remaining from the previous year were, for the most part, withdrawn early in 1919, and with the close of the fiscal year on June 30th, the Food Administration terminated its activities. The U. S. Grain Corporation and the Sugar Equalization Board, however, continued in existence throughout the year.

The popular expectation of material reductions in food prices failed of realization. Despite some fluctuations, notably on meats, *Bradstreet's* reported for July 31, 1919, an index figure for wholesale prices of 31 food articles 3.7 per cent higher than on Dec. 19, 1918, and the highest level on record. Some reductions were noted during the fall months, but on Dec. 19, 1919, its index number was still 0.6 per cent higher than on the corresponding date of the previous year. Wheat flour had increased during the year from \$10.75 to \$14.50 per barrel, potatoes from \$3.75 to \$5.50 per barrel, eggs from 66 to 80 cents per dozen, molasses from 76 to 97 cents per gallon, rice from 10¼ to 14 cents per pound, and raisins from 9¼ to 13 cents a pound. Pork, lard, cheese, beans, coffee, and tea were the principal foods to show decreases, and all these were under 15 per cent.

As regards retail prices, the developments were even more discouraging to the consumer. According to data collected by the U. S. Department of Labor in 50 cities, up to Dec. 1, 1919, the average family expenditures for the 22 principal foods increased 2 per cent during the month of November, 5 per cent during the entire year, and 84 per cent since November, 1913. During the six years studied, rice, bread, potatoes, corn meal, flour, lard, and sugar had increased over 100 per cent.

The disparity between wholesale and retail prices, and in particular the slowness with which the latter responded to reductions made by the wholesaler, was the subject of specially unfavorable comment. Thus, during the summer material cuts were made in the prices paid for cattle, yet the complaint was general that little if any relief resulted to the ultimate consumer in either homes or public eating-places. A similar situation was noted with coffee, reported at 15 cents per pound at wholesale Dec. 19, 1919, as compared with 17.25 cents on the corresponding date of the previous year.

Since the Department of Labor estimated that the average annual food expenditure per family for the 22 principal foods in 39 cities had risen

to \$638, and also that in the average family 38.2 per cent of all expenditures is for food, an economic problem of grave importance was presented to many thousands of families. This problem was further complicated by the even larger increases of the year in the cost of clothing, furniture, building materials, and other commodities, and led very naturally to widespread demands for increases in wages and salaries.

So serious did the question become that on August 8th President Wilson addressed a joint session of Congress on the high cost of living. In this he stated that the high prices demanded were "the talk of every domestic circle and every group of casual acquaintances even. It is a matter of familiar knowledge, also, that a process has set in which is likely, unless something is done, to push prices and rents and the whole cost of living higher and yet higher in a vicious cycle to which there is no logical or natural end." He dealt especially with food questions, pointing out that although for a number of the most important foods the supply in dry and cold storage in June, 1919, was 19 per cent greater than on the previous year, yet prices had risen. Thus, the stock of frozen fowls had increased almost 300 per cent, and yet the price had risen from 34.5 to 37.5 cents per pound. Butter increased in supply 129 per cent and in price from 41 to 53 cents per pound. Among the remedies suggested for the situation were the sale by the government of its surplus stocks of army food and clothing, the extension of the Food Control Act of 1917, the regulation of cold storage, and the requirement that all goods designed for interstate commerce should if practicable be marked with the price at which they left the hands of the producer.

The surplus food supplies of the army were offered to the public soon afterwards by sales through municipalities or municipal agencies, and subsequently direct to consumers through the Post Office Department, orders being taken at post offices and by carriers, and delivery being made by parcel post until late in September, when 25 retail stores were opened by the Quartermaster Corps. Sales were then made over the counter within the community and by mail order and parcel post delivery in the remainder of the sales district. Canned foods were among the principal commodities sold, the prices ranging from 15 to 25 per cent below the prevailing scales for comparable goods. The total sales reported to December 6th aggregated \$15,713,572.15, at an estimated operating expense of 8.5 per cent. This did not include the huge supplies overseas, which were sold to the French government as a whole for \$400,000,000. Thousands of individual families benefited by this undertaking, though its effect upon retail prices was problematical.

An act amending the Food Control Act became law October 22d. The provisions of this act were extended, chiefly by prescribing a penalty of a fine of not exceeding \$5000, imprisonment for not more than two years, or both, for individuals profiteering through hoarding, overcharging, willful destruction of necessities, or conspiracy in restricting their production or distribution. The administration of the act was assigned to the Attorney General, with a revival of food administrators in various States and other subdivisions and the appointment of local "fair price committees." These committees, usu-

ally made up of wholesale and retail dealers as well as representatives of the general public, were expected to formulate retail "fair price lists" as a basis for combating profiteering.

In a statement issued Dec. 22, 1919, the Attorney General announced that in 18 States, 179 prosecutions had been instituted for profiteering under the act and 99 seizures of goods made for hoarding. In two cases involving hoarding, jail sentences of three and five months, respectively, had been imposed in addition to fines.

A bill was passed by the House of Representatives, Sept. 30th, restricting the duration of cold storage of most foods for interstate commerce to 12 months. The completion of legislation along this line was again advocated in President Wilson's message of December 2d, as was also an extension of the Food Control Act of six months after the formal proclamation of peace and his previous recommendation of a requirement to mark all package goods with the cost price.

Legislation was also passed by Congress Dec. 20, 1919, authorizing the President to continue the U. S. Sugar Equalization Board (Inc.) during 1920, and to take such steps as would secure "an adequate supply and an equitable distribution of sugar at a fair and reasonable price to the people of the United States." This action followed several months of increasing difficulty on the part of the consumer in obtaining sugar, culminating in many sections of the country in a virtual suspension of retail sales. Among the many explanations suggested for this anomalous condition were an increased domestic consumption of sugar in the form of soft drinks and confectionery, failure of the government to take steps to purchase the 1920 Cuban sugar crop, as had been done the year previous, and the withholding of sugar from consumption for speculative purposes and sales to confectioners and other manufacturers of food products at prices higher than those prescribed for dealers supplying the general public. Greatly increased exports to Europe, totaling during July, August, and September, 1919, alone, 333,452,731 pounds, an amount nearly equal to the exports for the entire five-year period 1910-14, were believed by many to have been an appreciable factor in the situation. On the other hand, the sugar imports in September, 1919, of 708,638,554 pounds indicated that even with these large exports there should have remained a considerable quantity for local consumption.

Whatever the explanation, many thousands of householders experienced a shortage of sugar greater than at any time during the war. Home canning of fruits, energetically advocated by the government in 1918, was seriously impeded, although ways were shown by the Department of Agriculture and other extension agencies for canning without sugar. Sugar substitutes, such as honey, glucose, and corn sirup, were resorted to for cooking and table use in many families, and the Department of Agriculture also advocated the wider utilization of malt sugar sirup, derived from barley and other grains by a malting process. Warnings were issued, however, against the employment of saccharin, a coal tar derivative without food value and deemed by the Department a "menace to health."

The supply of flour, which continued under the jurisdiction of the U. S. Grain Corporation, proved ample for the domestic requirements and heavy foreign shipments, although there was a

rise in price during the year. In December the Grain Corporation reported that it had purchased 500,000 pounds of flour from soft red winter wheat for sale to the public through trade channels at the rate of 75 cents per 12 pound package.

A report of the Federal Trade Commission directed public attention to the wide extension of activities in recent years of the large packing houses. It was shown that many of these concerns were now dealing in wholesale groceries, meat substitutes, and many other commodities. Legal action was begun against these concerns, and in December a compromise was announced in which the five principal packers agreed to dispose, within two years, of their holdings in public stockyards, stockyard railroads and terminals, and cold storage warehouses except where necessary for their own meat products, to disassociate themselves permanently from the retail meat business and all their so-called "unrelated" lines, and in general to confine their trade to meat and provisions.

Considerable food legislation was also enacted by the States. Massachusetts appointed a special commission on the necessities of life, and prescribed penalties for conspiracy to maintain or increase the cost of such necessities. Illinois and Montana prohibited the willful destruction of food to influence market prices. Montana also provided a State Trade Commission with jurisdiction over foodstuffs and other commodities. Tennessee enacted a cold storage law and Pennsylvania adopted a new law. Several other States regulated various marketing practices, notably of eggs, meats, and bread.

FOOD SITUATION ABROAD On Jan. 3, 1919, Mr. Herbert Hoover was appointed director general of an international organization of the Allied governments for the relief of liberated countries, both neutral and enemy. It was estimated that at least \$1,500,000,000 worth of food must be imported to meet the actual needs for the first six months of the year, including at least 20,000,000 tons of bread grains alone, as well as vast quantities of meats, fats, and other commodities. A tremendous problem was thus presented, further complicated by the limited shipping available, destruction of credits and rise in foreign exchange, inadequate internal transportation and distribution agencies, and many other factors. These difficulties were particularly serious among the newly-liberated peoples of Austria, Turkey, Poland, and Western Russia, and on February 24th following a cable message from President Wilson an emergency appropriation of \$100,000,000 was granted by Congress as a relief fund in these regions. The American Relief Administration was organized, also with Mr. Hoover as director general, for the disbursement of this fund. Many millions of dollars were also contributed by the American people for relief through charitable organizations in the devastated regions in France, Belgium, the Near East, and elsewhere.

Material benefits resulted from these and other enterprises, but none the less the situation with respect to food and clothing in Europe became increasingly important during the summer, as a result of failure to revive production on a sufficiently vigorous scale and an outbreak of extravagance as a reflex from the strenuous economy which had prevailed and a rise in the standard of living among large sections of the

working classes. A forceful statement by Mr. Hoover, published in British journals, pointed out that a return to normal conditions could not be expected until each country in Europe restored its pre-war production and modified its standards of living.

At the close of the year, following European harvests of approximately 80 per cent, Mr. Hoover estimated that from 15,000,000 to 20,000,000 persons in central and eastern Europe outside Germany faced starvation unless quick means could be devised for their assistance. The greatest immediate difficulty was that of credits, but he predicted that on Aug. 1, 1920, there would be no considerable carry over of food supplies anywhere in the world.

In Great Britain, restrictions were removed from most foods during the year, although rationing of meats was continued until November. Butter consumption was still restricted to 1½ ounces per person per week, and the corresponding sugar ration was reduced during the fall from 12 ounces to 8 ounces. Wholesale prices were still fixed for many commodities, and the Food Ministry continued to distribute all cheese, bacon, ham, lard, dried fruits, bread, butter, and cocoa. The cost of food in Great Britain is reported as slowly falling for the first six months after the signing of the armistice, and then rising through the summer until by September it had returned to the highest war level and was about 133 per cent above July, 1914.

In Canada a Combines and Fair Prices Act was adopted embodying the principal features of an administrative order of Dec. 11, 1918, forbidding the undue accumulation or withholding from sale of any necessary of life or the selling of such necessities at unreasonable prices. Decrees were issued in France fixing official prices for foods and other commodities and requiring the posting of prices by retailers, hotel keepers, and others. The use of saccharin as a sweetening continued to be general. Food cards were still required in Switzerland, and in the spring of 1919 meatless days and other expedients were resorted to.

The cost of living was reported to have increased since the war began by 280 per cent in Belgium and 181 per cent in Sweden. Even in regions far removed from the seat of war food price increases were reported, such as about 100 per cent in Peru, 52 per cent in Australia, and 50 per cent in Netherlands and India. See also AGRICULTURE, LIVE STOCK, DAIRYING, and SUGAR.

FOOD CONTROL. See FOOD AND NUTRITION.

FOOD POISONING. During the autumn of 1919 an episode of botulism occurred in Detroit in which the poisonous food was pickled olives. Attention was thereby directed to this rare and peculiar form of food intoxication, which is caused by the product of an anaerobic bacillus, the *Bacillus botulinus*, so called because the first cases described were due to the consumption of sausage. The remarkable features of this intoxication, aside from its deadliness, are the apparent sweetness and edible character of the food, at least in most episodes, and the delay in the appearance of the symptoms, which may amount exceptionally to several days. The bacillus itself is not pathogenic nor does it cause poisonous decomposition of the food. The toxic material is the secretion of the germ itself and hence the latter makes one of a group of three, the other two organisms to secrete a

similar poison being the bacilli respectively of diphtheria and tetanus. In the laboratory it is possible to antidote successfully the action of this poison by an antitoxin and if botulism should ever assume threatening proportions by wholesale attacks it could doubtless be antagonized with the same success as the other diseases mentioned and either aborted or cured. No class of food seems to be exempt from the possibility of conveying this poison, and among those thus far recorded are ham and sausage, canned beans, canned pears, pickled olives, etc. The toxin is easily destroyed by boiling heat and the custom of reheating all canned goods is therefore a salutary one. It is evident that poor technique of preservation is responsible for some of the cases, as deficient strength of brine in pickled foods which should be at least 6 per cent of sodium chloride. Sugar-preserved foods are less dangerous and a source of peril is seen in the present scarcity and high price of sugar which has led to other methods of preservation. Some of the recorded cases have been due to the now tabooed custom of tasting canned goods when first opened to determine their fitness for consumption. Space does not permit of an enumeration of the symptoms of botulism which are many and complex. They are to be found in reference works. This form of poisoning bears little resemblance to ordinary ptomaine poisoning and in some respects, such as late appearance and profound involvement of the nervous system, recalls some forms of mushroom poisoning.

FOOD PRODUCTION. See AGRICULTURE.

FOOTBALL. Football shared in large measure the boom that signalized all sports in 1919. The popularity of the game was particularly emphasized by the record attendance the contests attracted throughout the United States. Abroad the conditions attending soccer were the same, the number of spectators at the various matches being larger than ever before.

In American college football the elevens to make the best showing were Pennsylvania State College in the East, the University of Illinois in the Middle West; Centre College in the South, and the University of Oregon in the Far West. Four teams went through the season without sustaining a single defeat. They were Harvard, Centre, Stevens Institute, and the University of Notre Dame. The closest call Harvard had was the game with Princeton which resulted in a tie.

A noticeable feature of the football year was the strong showing made by the elevens representing the smaller institutions. This was primarily due to the development of the so-called "open game" among the little fellows, clever use of the forward pass enabling them to overthrow teams possessing much more weight than they. Colgate University with a small number of students to draw from yet turned out an eleven that defeated Princeton, Cornell, and Brown. Boston College also caused a big upset by vanquishing Yale.

Walter Camp, often referred to as the "Dean of Football," made the following selections for his All-American eleven.

Ends, Higgins, Pennsylvania State, and H. Miller, University of Pennsylvania; tackles, West, Colgate, and Henry, Washington and Jefferson; guards, Alexander, Syracuse, and Youngstrom, Dartmouth; centre, Weaver, Centre College; quarterback, McMillan, Centre College; half backs, Casey, Harvard, and Harley, Ohio

State University; fullback, Rodgers, West Virginia University.

A summary of the games played by the leading college teams in 1919 follows:

Pennsylvania State 33, Gettysburg 0; Penn State 9, Bucknell 0; Penn State 13, Dartmouth 19; Penn State, 48, Ursinus 7; Penn State 10, Pennsylvania 0; Penn State 20, Lehigh 0; Penn State 20, Cornell 0; Penn State 20, Pittsburgh 0.

Harvard 53, Bates 0; Harvard 17, Boston College 0; Harvard 35, Colby 0; Harvard 7, Brown 0; Harvard 47, Virginia 0; Harvard 20, Springfield Y.M.C.A. College 0; Harvard 10, Princeton 10; Harvard 23, Tufts 0; Harvard 10, Yale 3.

Colgate 34, Susquehanna 7; Colgate 14, Brown 0; Colgate 21, Cornell 0; Colgate 7, Princeton 0; Colgate 7, Dartmouth 7; Colgate 21, Rochester 0; Colgate 7, Syracuse 13.

Dartmouth 40, Springfield Y.M.C.A. College 0; Dartmouth 13, Norwich 0; Dartmouth 27, Massachusetts Aggies 7; Dartmouth 19, Penn State 13; Dartmouth 9, Cornell 0; Dartmouth 7, Colgate 7; Dartmouth 20, Pennsylvania 19; Dartmouth 6, Brown 7.

Syracuse 27, Vermont 0; Syracuse 7, U. S. Military Academy 3; Syracuse 24, Pittsburgh 3; Syracuse 0, Washington and Jefferson 13; Syracuse 13, Brown 0; Syracuse 14, Rutgers 0; Syracuse 9, Bucknell 0; Syracuse 13, Colgate 7; Syracuse 6, Indiana 12; Syracuse 0, Nebraska 3.

Princeton 28, Trinity 0; Princeton 9, Lafayette 6; Princeton 34, Rochester 0; Princeton 0, Colgate 7; Princeton 0, West Virginia 25; Princeton 10, Harvard 10; Princeton 13, Yale 6.

Pittsburgh 33, Geneva 0; Pittsburgh 26, West Virginia 0; Pittsburgh 3, Syracuse 24; Pittsburgh 16, Georgia Institute of Technology 6; Pittsburgh 14, Lehigh 0; Pittsburgh 7, Washington and Jefferson 6; Pittsburgh 3, Pennsylvania 3; Pittsburgh 17, Carnegie Tech 7; Pittsburgh 0, Penn State 20.

West Virginia 61, Marietta 0; West Virginia 55, Westminster 0; West Virginia 0, Pittsburgh 26; West Virginia 27, Maryland 0; West Virginia 60, Bethany 0; West Virginia 25, Princeton 0; West Virginia 6, Centre College 14; West Virginia 30, Rutgers 7; West Virginia 55, Ohio Wesleyan 6; West Virginia 7, Washington and Jefferson 0.

Stevens Institute of Technology 6, Haverford 0; Stevens 37, Connecticut Aggies 0; Stevens 31, Rhode Island 3; Stevens 13, Rensselaer 0; Stevens 13, Columbia 0; Stevens 24, New York University 3; Stevens 62, Worcester Tech 0.

Pennsylvania 16, Bucknell 0; Pennsylvania 54, Pennsylvania Military College 0; Pennsylvania 89, Delaware 0; Pennsylvania 55, Swarthmore 7; Pennsylvania 23, Lafayette 0; Pennsylvania 0, Penn State 10; Pennsylvania 19, Dartmouth 20; Pennsylvania 3, Pittsburgh 3; Pennsylvania 24, Cornell 0.

Washington and Jefferson 23, Kiski 0; Washington and Jefferson 20, Carnegie Tech 0; Washington and Jefferson 16, Westminster 0; Washington and Jefferson 13, Syracuse 0; Washington and Jefferson 6, Pittsburgh 7; Washington and Jefferson 14, Bethany 0; Washington and Jefferson 33, West Virginia Wesleyan 0; Washington and Jefferson 0, West Virginia 7.

Yale 20, Springfield Y.M.C.A. College 0; Yale 34, North Carolina 7; Yale 3, Boston College 5; Yale 37, Tufts 0; Yale 31, Maryland 0; Yale 4, Brown 0; Yale 6, Princeton 13; Yale 3, Harvard 10.

Centre College 95, Hanover 0; Centre 12, Indiana 3; Centre 57, St. Xavier 0; Centre 69, Transylvania 0; Centre 49, Virginia 7; Centre 14, West Virginia 6; Centre 56, Kentucky 0; Centre 56, DePauw 0; Centre 77, Georgetown College 7.

Illinois University 14, Purdue 7; Illinois 9, Iowa 7; Illinois 10, Wisconsin 14; Illinois 10, Chicago 0; Illinois 10, Minnesota 6; Illinois 29, Michigan 7; Illinois 9, Ohio State 7.

The soccer team of the Bethlehem Steel Company for the second successive year won the championship of the United States through its defeat of the Paterson F.C. of New Jersey in the final game by a score of 2 to 0. The Bethlehem eleven made a tour of the Scandinavian countries during the year and returned with a record of 7 victories, 5 draws, and 2 defeats.

The teams representing Stockholm and Gothenburg were the only ones to overthrow the Americans. Among the United States college elevens the University of Pennsylvania again carried off the championship laurels in a series of games with Harvard, Yale, Princeton, Cornell, and Haverford.

FOREST FIRES. See FORESTRY.

FORESTRY. The forest fire situation was even more serious than in 1918 though far less disastrous to human life. Before the end of June, the worst fire season ever faced in the Northwest and in adjacent Canada had begun. It continued well into September resulting in a heavy loss of timber and young growth. The emergency expenditures for fire fighting in western Montana and northern Idaho National Forests came to more than 10 times the regular protective funds provided for the same forests. The situation was worse in these States than elsewhere, although 200,000 acres of watershed forest, of great importance in maintaining the water supply of Los Angeles, was burned over. Over 500,000 acres were burned over in northern Michigan. Preliminary estimates made by the United States Forest Service indicate that up to September 30th, about 1,000,000 acres of National Forest land and 500,000 acres of private land was burned over. Government fire fighting expenditures from July 1st to September 30th were nearly \$3,000,000. Eastern Canada reported a serious season, with heavy losses in Ontario. The Prairie Provinces also suffered severely. Forest fire losses in British Columbia approximated \$1,000,000. Late in the year a forest fire wiped out a cork forest of over 20,000 acres in France between Toulon and Nice.

Through a cooperative agreement between the U. S. War Department and the U. S. Forest Service, airplane patrol was conducted over the National Forests, mainly in California. The service was started in June and further developed as the season progressed. Beginning September 1st, approximately 16,000,000 acres of National Forests, and incidentally 5,000,000 acres of privately-owned timberland were covered twice each day. At the close of the season, the officials of the Forest Service stated that the record made by this service had proved beyond question the effectiveness of the airplane as an aid in discovering and locating fires. The effective dis-

covery radius at 5000 feet is at least 30 miles. The seaplane patrol of the St. Maurice Forest Protective Association in Quebec was found to be entirely practical.

FORESTRY AS A PRIVATE INDUSTRY. Doubtless the most discussed forest problem in 1919 was that of the waning timber supply and means of conserving and extending it. Summing up the opinions expressed by leading foresters in various countries, there is a crying need for legislation that shall encourage forestry as a private industry. Reafforestation by government agencies alone will not be sufficient to offset the constantly increasing demands on the world's timber supply. Nowhere is this more evidenced than in the United States where 97 per cent of the timber and other wood products are obtained from private forests, and where private owners hold four-fifths of the standing timber of the country. It is the best and most accessible timber and comprises nearly the entire supply of such important commercial species as Eastern white pine and spruce, Southern pine, cypress, redwood, and most of the hardwoods. Most of these private holdings are not reafforested after being cut over, since the forest taxation laws combined with the risk involved have rendered private forestry an unattractive industry. To meet this situation various State authorities, forest organizations, and institutions, as well as the leading lumber interests of the country held many conferences in 1919 with the view of bringing about permanent forest production on all lands which are better adapted to forestry than other purposes. The United States Forester was requested to draw up a policy of forestry for the nation, providing for the co-operation of federal, State, municipal, and private agencies in seeking the protection and beneficial utilization of our present forest resources, the renewal of forests on lands not needed for agriculture and settlement, the stability of forest industries, and of satisfactory conditions for forest workers. A strong movement was also launched in France, seeking the development of a policy that would promote private as well as national forestry, and would also provide for the rational exploitation of colonial forests. Great Britain took a definite step toward the development of a reafforestation policy.

LEGISLATION. The Forestry Bill passed by the Parliament of Great Britain in August provides for the appointment of a Central Forestry Commission, consisting of eight commissioners who shall be responsible for the forest policy in Great Britain and Ireland. It also provides for the afforestation of 1,750,000 acres in 80 years, 250,000 acres to be planted in the first 10 years at a cost not exceeding £3,500,000. The Ontario government passed an act providing that the Lieutenant-Governor in Council may declare any suitable land a "private forest reserve" upon the recommendation of the Minister of Lands, Forests, and Mines, and with the consent of the owner. The land so classed must always remain a reserve. It will receive government protection, and trees will be furnished the owner for reafforestation purposes. In the United States the Post Office Appropriations Act made available \$9,000,000 for roads and trails within or partly within the National Forests, and \$600,000 were provided under the Agricultural Appropriation Act for the purchase of additional watershed land. Pennsylvania amended the act es-

tablishing the Department of Forestry, and created a State Forest Commission, composed of the Commissioner of Forestry and four other members appointed by the Governor. The Commission is empowered to acquire land for State forests by condemnation proceedings, appoint scientific assistants and other employees, and publish the results of forestal investigations and inquiries. Oregon and California provided for the fining of citizens who refuse to help fight forest fires. All State lands in Alabama were declared forest reserves and game refuges. Minnesota established a Board of Control empowered to issue bonds to meet forest fire emergencies. Montana established a closed season for burning brush with a permit. Certain Indiana cities were authorized to establish and maintain memorial forests.

NATIONAL FORESTS. The net area of the National Forests on June 30, 1919, was 153,933,700 acres, as compared with 155,374,602 acres June 30, 1918. Of the decrease, the work of land classification was responsible for 1,031,007 acres. With the completion of this work in sight, there is now a prevailing tendency in the public-land States of the West to extend the area of the forests. Public-land additions for the year ending June 30th amounted to 39,234 acres and there were pending in the Interior Department proclamations providing for public land additions totaling 283,780 acres. Also there was legislation pending in Congress, where the States must obtain consent, for public land additions to the forests approximating 1,700,000 acres. By the act of Feb. 26, 1919, the Grand Canyon National Park was created. For this purpose, 606,720 acres were transferred from the Kaibab and Tusayan National Forests. Increase of the National Forests in the East through purchases continued at a conservative rate. The total net area of public land in the National Forests established from purchase areas now aggregates 1,347,666 acres. In addition 396,493 acres have been approved for purchase by the National Forest Reservation Commission.

The total receipts from the National Forests for the year ended June 30, 1919, were \$4,358,414, an increase over 1918 of \$783,484. To this total, the grazing business contributed \$2,609,169; the timber business, \$1,540,099; special uses and water power development about \$209,144. The cost of operating the forests again approximated \$4,000,000, exclusive of emergency fire control costs.

FORESTRY IN HAWAII. The Territory of Hawaii has officially brought within forest reserve boundaries all the land that it is deemed necessary to maintain permanently under forest cover "to safeguard a continued and steady supply of water for the use of agricultural and domestic pursuits in the Territory." The total area of the 47 forest reserves is 814,926 acres, or approximately 20 per cent of the total area of this entire group of islands. Fencing of the boundaries and the eradication of wild stock is actively going on. Fire protection is not a large factor in Hawaii. In the extension of forest areas through planting, the Koa (*Acacia koa*) is the species most used, but much interesting work is also being done in the experimental planting of trees from many parts of the world. Eucalypts are being extensively planted on private lands, chiefly on sugar plantations. Territorial forest nurseries are maintained on three islands

to supply demands for stock amounting to over 300,000 seedlings a year. The trees are sold at cost for private planting. The Hawaiian Sugar Planters' Association has established a Division of Forestry, which will coöperate with the Territorial forester in the proper care of certain of the forest reserves.

KILN DRYING OAK FOR VEHICLES. One of the distinct developments of experiments conducted at the Forest Products Laboratory at Madison, Wis., during the war was a rapid method of seasoning oak. It requires from two to three years to air season heavier oak wagon stock. Better stock has been secured by drying this heavy green oak according to Forest Service recommendations, and the time for 3-inch material green from the saw is reduced to 90 or 100 days. Three large plants using this system had negligible losses, as compared with losses at plants using other methods, which ranged from 10 per cent up to complete loss.

NEW MATERIALS FOR PAPER MAKING. At the time the armistice was signed the U. S. War Department had on hand a large tonnage of second-cut cotton linters reserved for the manufacture of nitrocellulose. Commercial pulping trials and paper runs made with these linters and cotton hull shavings at the Forest Products Laboratory demonstrated that these materials can be pulped with decidedly less chemical and bleach consumption than wood, and that they are excellently adapted for the production of high-grade book, writing, blotting, tissue, and other papers. It is believed that these experiments may have a far-reaching economic influence on the future of the paper supply in the United States, and arrangements have been made for a demonstration on a tonnage basis under average mill conditions.

INSTITUTIONS, PERSONNEL, ETC. A Chair of Forestry is to be established at the University of Edinburgh with an endowment of £14,000. The Mexican government has established a National Forestry School at Coyoacan, Federal District. A forest biological station was authorized by the New York Legislature, with headquarters at the College of Forestry at Syracuse University. It will be known as the Roosevelt Wildlife Forest Experimental Station. The principal object will be to study the habits, life histories, methods of propagation and management of fish, birds, game, and food and fur-bearing animals and forest wild life. The station did not receive a State appropriation, but work will be started at once with college funds under the directorship of Charles C. Adams. A new department of Forest Recreation was established at the New York State College of Forestry, with Prof. H. R. Francis in charge. The name of the College of Forestry at the University of Washington has been changed to the College of Forestry and Lumbering, and the work has been broadened out to include almost every aspect of the lumbering industry. The laboratory of forest pathology of the Bureau of Plant Industry of the U. S. Department of Agriculture has been transferred from Missoula, Montana, to Spokane, Wash., where permanent quarters have been provided. Dr. B. E. Fernow has retired from the deanship of the Faculty of Forestry, University of Toronto, and has been made Professor Emeritus. Mr. R. S. Troup, assistant inspector-general of forests, India, has been elected professor of forestry at Oxford. The *Australian Forestry Jour-*

nal is being issued quarterly under the direction of the Forestry Commissioners of New South Wales. The New York State Forestry Association has begun the publication of a quarterly journal under the title *New York Forestry*.

Yard, *The Book of the National Parks* (New York, 1919); A. J. Wallis-Taylor, *The Preservation of Wood* (London, 1918); N. C. Brown, *Forest Products: Their Manufacture and Use* (New York, 1919).

FORGET, SIR RODOLPHE. Canadian financier, died at Montreal, February 20. He was the president of the Quebec and Saginaw Railway and various important companies and was partner in L. G. Forget and Company from 1882 to 1897. He was the founder of the institution which bears his name in 1907.

FORMOSA, or TAIWAN. A Japanese island situated off the coast of the Chinese province of Fukien. Capital Dai-hoku (or Taipei). Area, 13,839 square miles. Population, estimated in 1917, 3,650,047 (1,899,128 males and 1,750,919 females). The chief towns are Taihoku (102,249 inhabitants); Tainan, Kagi, and Taichu. The chief agricultural produce is rice, while sugar cane, tea, sweet potatoes, jute, indigo, and rami are grown.

The forests yield camphor, which is a government monopoly. Among other industries are sugar manufacture, flour milling, tobacco, oil, spirits, iron work, bricks, glass, and soap. There are also valuable fisheries. The number of animals is estimated as follows: Sheep, 90; goats, 14,000; cattle, 130,000; caribou, 260,000. The production of centrifugal sugar in 1917 was about 978,176.676 pounds. Minerals in 1919 received an upward stimulus in production, though exact statistics are not at hand.

The commerce of Formosa is largely with Japan. The chief foreign countries with which there is traffic are China and the United States. In 1917, the imports amounted to 88,843,879 yen; exports, 145,712,683 yen. The chief exports in 1917 were sugar, 15,775,205 yen; tea, 4,492,860 yen; and camphor, 4,628,638 yen.

The revenue for 1918-19 was estimated at 55,261,429 yen, which balanced an equal expenditure. Communication and public works are the main items of expenditure, and inland taxes, customs, and government enterprises provide the main revenue. A subvention from the Japanese government of 5,000,000 to 9,000,000 yen annually further augments this amount. In 1917 there were 319 miles of railway open, and over 974 miles of private railway. In that year there were 159 post offices and a telegraph service that had 165 offices and a length of wire of 1181 miles, while the telephone service had 385 miles. At the end of 1917 the post office savings

bank had 292,851 depositors, with 3,935,091 yen to their credit. The current coinage in the island is that of Japan.

Many improvements have been innovated by the Japanese administration, including a wide educational programme that is conducted in the Japanese language. The cession of the island to Japan by China was effected by the treaty ratified on May 8, 1895, Japanese civil government in the island commencing on March 31, 1896. The island is governed by a Japanese Governor-General.

FORTY-EIGHT, COMMITTEE OF. A committee of representatives from the 48 States of the union organized for the purpose of (1) organizing a conference of Americans interested in a thoroughgoing programme of fundamental reconstruction; (2) presenting to such a conference a tentative platform dealing with political, social, industrial, and international reconstruction; (3) discussing at the conference the possibility of forming a political party, forming a coalition with other political parties, creating an organization to translate liberal conviction into political action, and accepting such other analogous suggestions as are presented by delegates to the conference. The conference was held in St. Louis on Dec. 9-12, 1919. The chairman of the executive committee is J. A. H. Hopkins; secretary, Allen McCurdy; and treasurer, William F. Cochran. Headquarters are maintained at 15 E. 40th Street, New York City. See UNITED STATES.

FOSTER, SIR GEORGE. Canadian representative at the Paris Peace Conference. He was born in Canada and entered the Canadian House of Commons in 1882 as representative from New Brunswick. In 1885 he was appointed to the ministry, holding the portfolio of Marine and Fisheries. After the election of Sir Robert Borden he became Minister of Trade and Commerce, which portfolio he was holding at the time of the Peace Conference.

FOX, JOHN, JR. Novelist, died at Big Stone Gap, Va., July 8th. He was born in Bourbon County, Ky., in 1863, graduated at Harvard in 1883. Among his works may be mentioned the following, some of which gained a wide reputation: *A Mountain Europa* (1894); *A Cumberland Vendetta* (1895); *Hell-for-Sartain* (1896); *The Kentuckians* (1897); *Crittenden* (1900); *Bluegrass and Rhododendron* (1901); *The Little Shepherd of Kingdom Come* (1903); *Christmas Eve on Lonesome* (1904); *Following the Sun Flag* (1905); *Knight of the Cumberland* (1906); *Trail of the Lonesome Pine* (1908); *The Heart of the Hills* (1913).

FRANCE. The westernmost state of central Europe between 42° 20' and 51° 5' N. latitude, and 7° 45' E. and 4° 45' W. longitude, separated from England by the Channel and the Straits of Dover; area, 207,054 square miles. It is divided for administrative purposes into 87 departments including the island of Corsica, but not including Alsace-Lorraine, which was regained by the treaty with Germany and was re-incorporated in the French administrative system. See ALSACE-LORRAINE.

POPULATION. Before the war (census of 1911) the population was 39,602,258, an increase of only about 350,000 since 1906. (For details of population by departments, chief cities, and other statistics based on the census of 1911, see YEAR BOOK for 1917 and preceding years.)

Paris, the capital, had a population before the war of 2,888,110.

After the war the discussion of the birth-rate which has always been a troublesome question was renewed with especial vigor on account of the enormous losses, namely: over 1,500,000 killed and a still larger though indeterminate number injured and incapacitated for work. The birth-rate had been declining before the war. In 1913 births had fallen off by 275,000. In 1911 the births were only 742,000 against 1,870,000 in Germany, 1,630,000 in Austria-Hungary, 2,700,000 in Japan, and 1,093,000 in Italy. Thus against the German-Austrian combination of 3,500,000, France would have only about one-fifth of the number and this was not counting Bulgarians and Turks and other hostile races. Various plans for increasing the population were proposed, as, for example, better housing for families with children; means of lightening the expenses incident to births; cheap dwellings to be reserved for large families of children; a heavier tax on the unmarried; and pensioning of widows. Some campaigning was done for attention along these lines by the so called National Alliance; but this did not apply to the country districts which were from the point of view of repopulating France the most important. Contrary to the usual opinion, it was said that the large families in Paris were generally to be found among the well-to-do, and even very wealthy classes. The French Academy had for a long time offered premiums to large families and the amount thus distributed would reach in 1920 the sum of 2,341,000 francs a year. Such a measure was recognized as good, but of very limited application.

In 1918 an official inquiry under the direction of the ministry of the interior was conducted into the loss of life in the invaded districts during the war. Owing to the disappearance of the civil records in most of the cities and villages, it was impossible to ascertain the exact number of persons who had been shot, mutilated, starved to death, or succumbed for other reasons relating to war conditions, but from many signs the figure appeared to be a high one. The small town of Orchies with 5000 inhabitants, for example, had been deliberately burned house by house in a single day by means of the pastilles invented by the German chemist, Ostwald. It was naturally impossible to determine the number of the dead or the fugitives who had perished along the routes while they were fleeing, and had been buried without any indication of their identity. It was the same way with many other villages, such as Douai, Cambrai, St. Quentin, etc., and for innumerable villages whose population had been driven to the frontier by the German soldiery. The loss of population, owing to the falling off of the birth-rate was also beyond the means of accurate calculation, but may be indicated by the following figures supplied by the city authorities of Lille: In 1913, the number of births was 4835; in 1914, 4541; in 1915, 2154; in 1916, 644; 1917, 602; 1918, 609. This gave a deficit during the period of 15,000 births for a population of about 200,000. Investigation was made in Lille into the extent of disease among the young, and careful examinations were held in all the schools, both public and private, in order to ascertain the proper food regimen for the children whose development had been retarded by famine. Out of 18,036 those in public

and private schools in Lille, in the period following the armistice about 8000 were placed in hospitals, or sent to colonies of convalescence by the authorities in charge of the liberated regions. This investigation in Lille brought out the fact that 60 per cent of the children had been checked in their physical development by the conditions of the war, and that about 40 per cent showed signs of tuberculosis or pulmonary weakness. In one school inspected in March, 1919, only one normal child was found out of 210 that were examined and of the rest 163 were victims of deformities or diseases of various kinds; 139 were suffering from swollen glands, 42 from rickets, and 6 from tuberculosis. It was asserted that in this district during the war not a drop of fresh milk had been distributed to children, or to sick persons during four years, that the average food ration had never exceeded for an adult 1600 calories a day, and that the general death rate from 1914 to 1918 had doubled.

EDUCATION. Primary education is free and compulsory for all children between the ages of 6 and 13. No later figures for education are available than those given in the preceding YEAR BOOK.

A project in the field of higher education that attracted much attention during the year was the establishment of a "College of the United States" at Paris. Under this name an institution was to be set up not unlike the colleges grouped around the Sorbonne in the Middle Ages which drew students from all countries. Its main object was to direct to France the sort of American students and specialists who had in the past studied in Germany. The French were struck by the extraordinarily large number of Americans that they encountered during the war who had received degrees from German universities. Groups of persons interested in education and at the same time in the promotion of closer relations between the two countries had worked to this end for many months past. A beginning was made in 1919 by throwing open certain courses and providing certain facilities for Americans. Several directors of laboratories in France, including Madame Curie and other eminent specialists, announced their readiness to cooperate with the college. A pamphlet was issued by the dean of the faculty of medicine giving complete information in regard to medical courses, etc., clinics, laboratories, etc., for distribution in English for all the universities in the United States, and it was arranged that in October there should be Bureaus of Information at points of departure in the United States and of arrival in Paris, where all necessary details could be ascertained. This was but one step in the direction of a closer intellectual alliance. It was further intended to establish an American library in Paris which would enable the French to realize and keep abreast of what was being done in America; also the organization of lectureships to popularize recent progress in France; translation into the French language of the best American scientific works, etc.

On November 3d it was announced that the referendum on the part of the associations of professors in normal schools, and of male and female teachers had given a strong majority against the plan for union with the General Federation of Labor, and it was said at the same

time that the referendum of college professors had the same result.

AGRICULTURE. The area and production of principal crops in 1917 are shown in the following table:

Crop	Area (1,000 acres)	Production (metric tons)
Wheat	10,260	8,923,100
Mixed corn	230	87,900
Rye	2,025	698,900
Barley	1,610	861,300
Oats	17,700	3,466,300
Potatoes	3,539	10,922,080
Bestroot, sugar	177	2,108,500
Tobacco	13	22,627

According to the customs returns the wine production for 1918 was 42,264,136 hectolitres, as compared with 36,103,894 for 1917. The wine yield of Algeria in 1918 was 6,343,101 hectolitres, as compared with 6,233,069 in 1917.

Some details of fruit production in 1917 are as follows: Cider apples, 3,486,560 metric tons; table apples, 214,122; table pears, 84,030; chestnuts, 133,090; walnuts, 41,793; olives, 170,600; peaches, 29,498; cherries, 30,234; plums, 29,791.

Farm animals in 1917 were as follows: Horses, 2,282,560; cattle, 12,443,304; sheep and lambs, 10,586,594; pigs, 4,202,280; mules, 150,115; asses, 324,580.

Total value of silk production in 1916 was 11,878,352 francs.

The eight hour law voted by the Chambers in the summer applied only to industries and not to agriculture. The question whether an eight hour law would benefit agriculture was under discussion before the national Agricultural Congress in Paris during August. There were 500 agricultural delegates assembled from all quarters of France. As to the working day the meeting declared that any limitation of hours would involve a corresponding reduction of output and a corresponding increase in price. This was the unanimous opinion of the Congress. The reasons given were as follows: The effect would be two-fold; it would increase the cost of living and it would oblige France to purchase at higher prices the essential food products. The Congress specifically voted against any legislative measure which would limit the hours of labor in agriculture.

Another topic of especial interest in the discussion of agricultural conditions in France was the question of small proprietorships. In the French Chamber there was much enthusiasm expressed for the further division of the cultivable land and the parliamentary orators were loud in their praise of small peasant proprietorship. But objection was raised to the carrying out of this policy that it would require large advances from the government and the government was in no position to incur these obligations. Creating new proprietors was not the simple thing that it appeared to be. Large bodies of capital were necessary for the purpose. Merely placing land at the disposal of cultivators accomplished nothing unless accompanied by means of supplying implements, fertilizers, stock, seed, and a sufficient capital to wait until the returns came in; and if large properties were cut up it would mean the construction of buildings for the several proprietors, houses, stables, sheds, wells, etc. It was argued that millions would be required for these purposes. It was estimated in 1919

that more than 2,000,000 farmers in France cultivated their own land and that more than 500,000 agricultural laborers were the owners of small bits of landed property. According to reports of 1919 the French peasant had greatly enriched himself as a result of the war. During the war and afterwards the agricultural class had effected a large saving in spite of the lack of man power and the heavy taxation. The extremely high prices enabled them to save the money, and the reports of various offices of registry showed extraordinary increase in the number of purchases by the farmers. The paying off of mortgages and the acquisition of land proceeded on a much larger scale than before. It appeared that peasant proprietorship was developing and that the agricultural class were acquiring ownership of the land. The division of landed estates as a result of the war furthered this process. The phenomenon was commented upon by the Socialists as indicating the probable increase of the conservative spirit of the peasants. There was much discussion during the year of improvement in agricultural conditions as well as in the industrial field. It was pointed out that under proper encouragement France was capable of producing far more than before the war. Complaint had been made of the small output per acre in France, and it was said that no such progress had been made in the raising of cereals or potatoes as in the neighboring countries. In the 40 years preceding the war countries adjacent to France, that at first had hardly been her equals, had ended by surpassing her. Various reasons were given for this, among them that the cultivable land was cut up into too small portions, that various fertilizers were lacking, that there was a deficiency of man power, of capital, of credit, etc. Nevertheless it was believed that by means of technical education, new methods of culture, and experimentation, France might make rapid progress. Among measures recommended in 1919 was the intensive culture of beet root. It was pointed out that if France in 1913 had been able to secure an output from the soil equivalent to that of other countries, she would have been able on the basis of land actually sown and at prices actually obtained in the world's market, to export 3,000,000,000 francs' worth of cereals and at the present time on account of the rise of price this figure would be tripled. But the cereals were not by any means the only possibility. Besides beet root, already mentioned, there was the peanut and oil palm, which could be obtained in great quantities from West Africa. Oil, grease, margarines, soaps could be extracted without impairing the nutritive value for cattle feeding. There was a great opportunity for butter and cheese, and as to fruits, the valleys of the Loire and Rhone could produce the finest fruits in the world. In this field it was urged that a more skillful system of packing and transport of fresh fruit, and of preservation and storage should be devised. It appeared unreasonable that England should actually hold the French market with her preserves, when she had to import the fruits and the sugar, and that France should be obliged to sell preserves of California peaches. It seemed not to be a question of man power, for in this particular field, women's work was effective. The production of vegetables also offered possibilities. In parts of the country where experiments had been tried, the soil had increased 10

fold in value as a result of raising vegetables. It was argued that proper means of preservation, as for example the drying of potatoes, would lead to an increased utilization of 25 per cent. The raising of poultry was also in a backward state and here too the work of women would be an important factor. Before the war the sale of meat abroad was insignificant. France had excellent stocks of cattle and it was argued that by means of cold storage great improvements could be made. Sheep from Algeria and cattle from the Sudan were destined in a few years to bring a large supply to the domestic market and set free for exportation the fine breeds of French cattle. Much was expected from fisheries on the coast. The fresh water fish had practically disappeared, in spite of the former abundance. Other avenues suggested were floriculture, apiculture, and especially wines and liquors. See AGRICULTURAL EXPERIMENT STATIONS.

MINERAL PRODUCTION. During the war France was cut off from her main sources of mineral production. Complete statistics of output were not available for years following 1913. In that year the figures on the leading mineral and metal products were as follows in metric tons: Coal and lignite, 40,844,218; iron ore, 21,917,870; pig iron, 5,207,307; finished iron and steel, 406,000; worked steel, 3,186,050. The coal output in 1917 was 28,960,000 tons.

It was reported in November that the coal situation, though serious, was not desperate because of the substitutes which had been found. The Ministry of Industrial Reconstruction announced in spite of the difficulty of supplying Paris and its suburbs the government had already realized about 70 per cent of the programme that it had undertaken. A commission in session at that time under the Ministry of Public Works considered the question of substituting petroleum compounds, especially mazout, for part of the necessary coal. Experiments were being made with mazout as a fuel for running elevators, and for water works. The two important plans under consideration: First, the substitution of mazout and other thick oils, or petroleum, for coal as fuel; and on the other hand, immediate changes in the mechanism necessary for the heating of boilers by these oils instead of by coal. At a meeting of the Ministry it was decided that oils should be substituted as soon as possible for coal in great industries and in the public services; that a progressive programme for the necessary changes in machinery should be formed at once; and that a system of national supplies of fuel oils should be organized for a period of at least five years, and coordinated with the programme of coal, exports and imports.

The discovery of the iron resources of the Briey Basin in 1895 made France one of the richest countries in the world in respect to that metal. In spite of the lack of coal France could maintain the fourth place in the world production, that is to say, next after United States, Germany, and England, which are far better off in regard to resources, and in 10 years, that is to say, from 1903 to 1913, France had doubled her output which at the latter date reached 5,207,000 tons and was on the point of increasing by a million tons. This was due largely to the organization of the industry under the so-called Comptoirs and the Committee of

Forge-masters. Under the former the producers were grouped for the purpose of organizing production, standardizing types, avoiding interruption of work, etc., to the advantage of employers and employees alike, and they had not the tyrannical features either of the American trusts or of the German cartels. The limit on the output of the respective plants was revisable every three years. The Committee of Forge-masters was founded 50 years ago and comprised the producers and smelters whose interests were sometimes opposed. It became a professional association under the law of 1884 and its policy was to develop man power and to improve equipment. It had promoted the coke industry along with the metal-working industry, and it had applied a part of its resources to the search for coal beds in France and elsewhere. France, however, was dependent on Germany for coal and Germany was not on the other hand dependent on France for mineral ores, in spite of the prevailing opinion to the contrary, because there was a rich supply in the Lorraine field then in her possession, as well as in parts of Bavaria. At the beginning of the war the government appealed to the Committee of Forge-masters for cooperation, and the Committee responded to the call. During the five years that passed, its work for the government was of the highest possible value and in one sense may be said to have saved the country. Early in the war the department of Meurthe-et-Moselle which alone contributed 90 per cent of the steel and iron products was invaded, and out of 170 blast furnaces 85 fell into the hands of the enemy; out of 164 Martin ovens, 48; and out of 100 converters, 53. Down to the autumn of 1918 France had been deprived of 64 per cent of her gas products and 62 per cent of her steel products. In spite of this it was necessary that the production of shells should go on at the enormous rate of 100,000 a day, according to the demand of the war minister on Sept. 20, 1914, and an increasing quantity of metal was soon required for cannon, guns, etc. Mobilization had caused a shut-down of all the plants and a crisis was threatening, but fortunately the same condition prevailed in Germany. Everything was lacking from the metal to the machinery. Coke ovens and blast furnaces were now constructed; an office was opened in London for the organization of producers from foreign countries; plants were readapted to iron- and steel-working; the labor question was attacked from various angles; foreigners and women were employed, and a system of organization by groups in different parts of the country was instituted. To facilitate financial operations credits were obtained from American and Swiss banks for the French manufacturers, who gave their signature to the government for more than 500,000,000 francs. No profit accrued from all this to the Committee of Forge-masters. From 1915 on the iron and steel production in France made good, and even exceeded the amount that could be used. The percentage worked in 1916 was 100; in 1917, 72; in 1918, 56. For castings, and for the same use for steel the percentages were respectively 94, 74, and 59. The rapid decrease was due to the lack of labor, fuel, and transport.

ECONOMIC CONDITIONS. France, like other countries, was harassed by serious labor troubles. The Socialists were successful in their May Day programme and on May 1st all the labor bodies in Paris ceased to work. On this occasion the

government showed the utmost firmness, employing troops to suppress disorder. For this it was attacked by the Socialists and several of them who were attached to the Peace Conference in the capacity of under-secretaries resigned. The Chamber of Deputies however supported the government by a strong majority. Serious economic and industrial questions including the high cost of living, increased taxes, hardships resulting from the fall of exchange, and the continuance of the censorship were among the causes of growing discontent. Strikes were very numerous. In the first week of June there were more or less serious strikes not only in Paris, but in other centres, involving coal miners, iron and steel operatives, motor car and aeroplane builders, the tube railway and omnibus and street car employees, locomotive engineers, employees of sugar refineries, and clerks. In the Parisian district the number of iron and steel workers on strike was placed at 300,000. Most of these strikes resulted from the fact that the eight-hour law enacted April 23d and carried into effect on June 2d provided at the same time that wages should be increased 25 per cent, but left the details of its application to be settled between the employers and the employed. This resulted in strikes on the part of workmen to enforce their demands. See UNEMPLOYMENT

The economic and financial conditions were under discussion in the Chamber toward the end of July. A Deputy interpellated the government in regard to the measures it intended to take to protect French industry against German competition and at the same time to avoid throwing French working men out of employment on account of the high cost of living. He cited a number of instances of German competition injurious to the French, and wished to know what measures of protection had been taken. He called in question the entire economic policy of the government, pointing out the high price of all raw materials in spite of the importation of foreign products at a low price. He denounced the exportation of necessities, attributing it to profiteering and speculation. He proposed the removal of customs duties, the control of purchases made abroad; the supervision of imports and exports; change in industrial customs, and establishment of schools of apprenticeship; the granting of credit to industries, and an international understanding in regard to the conditions of labor. The programme of the government was outlined by M. Clémentel, Minister of Commerce. The chief causes of the increased imports, he said, was the great difference in price. For example, glasses for reflectors in Germany cost only 70 centimes; in France they cost three francs and 25 centimes. It was manifestly advantageous to import them. In the long run, if such a situation lasted, it would be necessary to take measures against it, but as a matter of fact the crisis in French commerce was only temporary and resulted from high cost of coal, freight, and the rate of exchange. The price would go down with the imports of coal from Germany and the freight charges would diminish with the release of the transports engaged in carrying back the American troops. As to the rate of exchange, he promised an improvement in the future, saying that the Allies of France were ready to aid her in that respect. He said that 1400 American chambers of commerce had sent representatives proposing to aid

France, especially by long term credits, and urging that missions should be sent into the United States to explain the industrial situation and to start a campaign in favor of changes in American law concerning the exportation of capital. Proposals had been made concerning an interest fund for long term credits and a means of equalizing the rate of exchange. As to customs, it would be necessary to revise the tariffs but to avoid the extremes either of free trade or of protection. Merchandise necessary to existence was not to be exported henceforth so long as the stocks were short. The exportation of leather for example had been prohibited. Finally there must be harmonious labor legislation throughout the world. In Germany, for example, while the working-men had an eight hour day as in France, it was supplemented by two extra hours. The government would endeavor to carry out its programme of construction for the merchant fleet. The employers and working men were showing a spirit of coöperation which was bound to bring excellent results. There was a new spirit among employers and working-men alike, and the object of the government was to inspire confidence in the whole industrial community. The policy to be favored to-day, he said, was the true French Socialistic programme, the programme of Saint-Simon, namely the extension and organization of production, and the hierarchy of industry. He concluded with the remark that by means of this equilibrium of forces and harmony of efforts and wills, it would be possible to reconstruct the country and to give it a prosperity that would astonish the world just as its resistance in war time had astonished it.

RECONSTRUCTION. The Director General of the Technical Services estimated the needs of reconstruction in the invaded regions as follows: Building work alone would require 22,000,000 tons of material and the labor of 700,000 people for one year; 100,000 houses are to be entirely rebuilt, requiring 5,000,000,000 bricks, 3,000,000 cubic meters of sand, 1,000,000 tons of lime, 13,000,000 square meters of tiles, and 3,000,000 cubic meters of wood. Reconstruction of highways and railroads would require 3,000,000 tons of materials and the labor of 15,000 men for one year. An addition of 20,000 trains and 5000 trucks would be required. Figures were published in October showing some of the results of the reconstruction that had been accomplished since the armistice in the previous year. Out of 550,000 houses demolished, about 260,000 had been rebuilt; 2106 kilometers of railway line had been repaired; of 1675 kilometers of canal route which had been rendered useless during the war, 700 kilometers were restored; and of 1160 factories destroyed, 588 had been reestablished. Extraordinary progress had been made in restoring to a cultivable state the land devastated by artillery, or cut up by trenches and barbed wire, which still abounded in shells that had not yet exploded. This tract measured about 4,500,000 acres, of which about 1,000,000 acres had been restored to the cultivators and 500,000 was ready for sowing. About 6000 miles of barbed wire had been removed from the region. In 1913 the taxes amounted to 5,000,000,000 francs; they amounted in 1919 to 12,000,000,000 francs. France was counting on the aid of her Allies for the work was beyond her strength, inasmuch as she had lost by death, wounds, and

illness some 2,000,000 from her working class.

HIGH COST OF LIVING. The high cost of living in France was a more serious problem than among her Allies. Conditions were far worse than in England, and the government was freely criticized for not having followed a wiser policy. In general the prices at the beginning of the year were three or four times higher in Paris than in London. While this resulted to some extent from unavoidable differences, there were many in France who believed that if the government had followed the English plan the results would have been far better. It was pointed out that in England a strict and impartial system of rationing had been introduced, whereas in France there had been hesitation at the beginning, and after it was carried into effect it was enforced with the same vigor. In England there was no way of escaping the penalties of the law, which were applied equally to the rich and to the poor and there were many cases of important or conspicuous persons who were brought to trial. It was not possible in England as it was in France for the rich to compound with the authorities for infractions of the law. The French system was founded upon a different theory. The strict rationing and the fixing of the selling price was condemned there in certain quarters as a demagogic measure solely designed to placate the working class, but destined to fail, because there would soon be nothing left to distribute. In France they argued that it was better not to be concerned about the price, for the producer would be stimulated by this increase of price and in hope of gaining much he would produce all that he could, and thus abundance would result. This point of view was not verified by the result. According to statistics published by the French Ministry of Labor covering the relative cost of living in Paris and France generally from the outbreak of war down to March, 1919, it will be seen that in Paris the average increase in prices was 148 per cent and for the whole of France 178 per cent. The ministry issued the following table of increases:

Date	Increase in— Towns of over 10,000 inhabitants		Paris	
	Per cent	Per cent	Per cent	Per cent
January, 1918	112		91	
April, 1918	133		118	
July, 1918	144		106	
October, 1918	161		137	
January, 1919		148	
February, 1919	178		126	
March, 1919		148	

These figures were compiled after inquiries covering 13 different household articles of which 11 were food products. The ministry, however, pointed out that in every case the increase was calculated on a fixed quantity of each article, and as restrictions and high prices had brought about considerable changes in the mode of living, certain food products formerly in general use now being made use of in reduced quantities or replaced by cheaper articles, the above figures might be considered as the maximum. See **CITY PLANNING; DAMS; DOCKS AND HARBORS.**

COMMERCE. In 1917 the imports for home use were valued at 16,311,000,000 francs and the exports of French origin at 3,837,000,000 francs.

During the first half of 1919 French imports exceeded exports by 10,000,000,000 francs. The imports during that period exceeded by 2,389,000,000 francs those during the same period in 1918. In spite of this enormous increase in value, the quantity of imports had slightly diminished. The diminution was in materials and manufactured products, while in food products there was an increase. Hence reduction was difficult in view of the high cost of living. On the other hand, as the result of the rise of prices, the value of exports, despite the falling off in their quantity, was nearly on the same level as in 1913, which may be taken as a normal year. The enormous rise of price is indicated by the fact that the quantity of exports had diminished by more than 500 per cent. These signs pointed of course to a crisis of production. France was purchasing from abroad vastly more than she was exporting, and the process could not continue without bringing disaster, hence the necessity, constantly urged in the press, of increased production which would enable the exchange of products for products. The French Customs Administration gave out the following import statistics of France for the first eight months of 1919: Imports of food products, 5,463,270,000 francs January-August, 1919, compared with 3,488,345,000 francs in the same period in 1918; materials necessary for industrial use, 7,792,592,000 francs in 1919, compared with 6,798,439,000 francs in 1918; manufactured products, 5,219,844,000 francs in 1919, compared with 4,336,159,000 francs in 1918. This gives a total of imports for the eight months in 1919 amounting to 18,475,706,000 francs, compared with 14,622,943,000 francs in the first eight months of 1918, or an increase of 3,852,763,000 francs. The figures for the month of August and the eight month period are based on the arbitrary valuations set by the valuation committee for the year 1918. The figures for the previous seven months were on the valuations set for the year 1917, and therefore the August figures (and the same will apply to figures for the subsequent months) are not strictly comparable with the previous figures.

Imports greatly exceeded exports and this continued in an alarming degree throughout the year. At its close estimates for only 11 months were available. According to these the imports from January 1st to the close of November, 1919, were 25,336,978,000 francs, and exports only 6,223,448,000 francs, or a deficit of about 19,000,000,000. This was explained chiefly by the fact that nearly all of the French exports fell under the head of luxuries, such as automobiles and silks, for which it was more difficult to find a market than for articles of necessity. In May a large number of imports were relieved from the control previously exercised and were allowed free entrance into France. These included wool, cotton, flax, chalk, bricks, jute, cement, marble, building stone, tiles, timber, sponges, turpentine, seeds, oil, mineral waters, platinum, silver, certain classes of rough iron and steel, lead, copper, tin, zinc, nickel, and antimony.

RAILWAYS. Total railway mileage open for traffic in 1915 was 25,633. It was provided by law that when the date on which the state of war should cease to exist was fixed by Presidential decree, the railroads should revert automatically to pre-war conditions. The railroad administrations informed the Minister of Public

Works, June 14, 1919, that the railroad systems were not in a position to return to normal running conditions prevalent in time of peace without the adoption of certain transitory measures. They asked for the maintenance of a certain number of the regulations at present in force, and particularly those respecting priority of transportation for certain essential products; and they also asked that the regulations governing delivery of goods be modified to a certain degree. In responses to this a decree was signed by the President Oct. 15, 1919, providing for certain modifications in the regulations during the period between the cessation of hostilities and Dec. 31, 1920.

The following are the more important provisions: The principal railroads must give priority in the following cases: To the transportation of goods destined for the reconstitution of the liberated regions, along the lines of the programme laid down by the Ministry for the Liberated Regions; to slow freight, in carload lots, along the lines recommended by the Ministries of Revictualing and Industrial Reconstitution in regard to the supply of fuel and revictualing of the whole country. A provisional committee will be formed to decide upon the necessary measures to insure the proper compliance with these provisions and the satisfactory working of the great railroad systems. Its decisions are final and obligatory for all the systems. Another committee will be appointed to deal with questions relating to railroad supplies and rolling stock, and to coördinate the action of the railroads in respect to such matters. This latter committee will include among its members three manufacturers of railroad material designated by the Ministry of Public Works. Its decisions are final, with the exception of measures relating to closing stations, suppression of trains, or limiting shipments. In such cases its decisions are subject to revision by the Ministry. Owing to the heavy burden thrown on the railways after the armistice, by the work of demobilization, they were for a time more congested even than during the war. On Oct. 1, 1919, nearly 14,000 trains were required for the demobilization of nearly 2,000,000 men and the transport of the men on leave. About 2000 trains of 50 cars each were required to return men and matériel to the stations in the interior. Besides these there were the provision and military trains employed in the service of the celebration of victory, carrying passengers to the various fêtes, etc., so that the total number of military trains running after the 1st of April was not less than 20,000. Then the American army setting out from Brest had to pass through all France requiring 2000 trains, and there were some 3000 required for the men on leave, and for provisioning. The demobilization of the American army alone demanded 2500 trains, and the Americans on leave and the provisioning of the American army required 1500 more. It was estimated accordingly that the total military transport on French lines during the eight months following the armistice kept 30,000 trains employed. The drain upon the navy was also serious, and it was estimated that sea transport between France, Algeria, Morocco, and other colonies, and eastern Europe provided for 740,000 men and nearly 5000 horses.

During the year 1919 extraordinary efforts were made to restore normal conditions of operation to the French railways, especially those in

RECONSTRUCTION IN FRANCE
A Street in the Rebuilt Section of Peronne

the battle area that suffered most severely. Chief of these were the Nord and Est, which required almost entire reconstruction, but which at the end of the year had been so restored that normal traffic could be resumed in a few months. On the Nord but one kilometer or $\frac{5}{8}$ mile of double track remained to be repaired at the end of the year, and this was over bridges in the course of reconstruction. The number of kilometers of double track out of service was reduced to 15 kilometers and of single track to 12 kilometers; these were short lengths approaching important bridges under reconstruction. All stations along the line of the Nord were in service at the end of the year. During October 49 bridges and viaducts were completed, bringing the total definitely completed to 256 out of 601. The reconstruction of the remainder was carried on rather more slowly and normally, the chief difficulties being inability to secure structural steel in France on short order.

At the time of the signing of the armistice the length of double track to be repaired on the Est railroad amounted to 577 miles of double track and 126 miles of single track. Of these by November, 1919, 519 miles of double and 122 miles of single track had been repaired, leaving but 58 miles of double and four miles of single track to be completed. By the end of November but 20 miles remained to be reconstructed. Forty-six out of a total of 214 bridges were definitely finished.

The political, economic and industrial conditions of the year naturally were reflected and found expression on the French railways whose efficiency was impaired at least where the lines were not altogether destroyed and rolling stock removed. Lack of equipment was a vital matter and increased wages were the order of the day. Added to this naturally was an increase of tariffs necessary by mounting costs of materials and operation and at the same time the political demand from Socialists and syndicalists for the nationalization of the railways. France however has had experience with both private and state operation, so that facts were available on which to discuss most thoroughly the question. It did not appear on this basis that state operation would act to reduce costs, either of maintenance or working. This subject was discussed during the year somewhat fully in the *Journal des Transports* (Paris).

According to this authority the coefficient of railway working, by which is meant the ratio between the cash receipts and working expenditure only (financial charges, interest and capital redemption of shares and debentures not included) was as follows in 1918:

	Per cent		Per cent
Orleans	85	East	96
Midi	87	North	112
Paris, Lyons & Medi-		State (et al.)	120
terranean	90		

In other words the state railways exceeded even the coefficient of the two railways which operated in the war zone and which were deeply affected by the war.

But it was possible to consider operating cost of state and private systems over a longer period than a single war year. A comparison of the state system with the Orleans could be made with advantage as the composition, geo-

graphical position and traffic were almost similar. In a 10-year period the coefficient of working of Orleans fluctuated between 52 per cent and 85 per cent, whereas that of the state varied between 68 per cent and 120 per cent.

The Orleans deficit reached 241,000,000, and it could be readily figured that if it had worked at the same price as the State, its immediate neighbor, its deficit would have reached over 1200 millions.

Accordingly it was argued that to represent nationalization, under those conditions, as a means of reestablishing the balance of exploitation without raising the tariffs, meant, either to ignore the facts, or to deny the well-trying power of experience.

In order to deal more fully with French railways a "Committee of Exploitation" was instituted during the autumn. This scheme was devised by M. Claveille, minister of public works, and the plan provided for the collaboration of representatives from the different classes of railway workers with the heads of departments and directors in the management of the roads. The committee was to comprise a high official of each line as president, the operating managers of all the lines, three representatives of commerce and industry designated by the minister of public works and three representatives of the employees, also designated by the minister, this last representation indicative of the increased attention that was being paid to the operating forces and labor generally. Another important and much needed step was the formation of a technical committee to supervise the rolling stock, composed of the chief engineers of all the lines, three manufacturers of railroad material and three representatives of the employees appointed by the minister of public works. That these committees would be responsive and work in harmony with the government was to be assured by the fact that a representative of the government would attend their meetings, and his assent will be necessary for the execution of exceptional measures.

Increased costs and deficits were common on various French railways, notwithstanding heavy traffic; this of course was due to expenses of fuel, material, and labor. During the year 1918, there were a dozen stations on the Paris Metropolitaine at each of which over 6,000,000 tickets were sold. Among these were: Vincennes 11 $\frac{1}{4}$ millions, Porte Maillot 10 millions, Bastille 9 $\frac{1}{4}$ millions, Gare du Nord 9 $\frac{1}{4}$ millions, Gare de l'Est 9 millions. While the total receipts increased by 3 $\frac{1}{2}$ million francs, the expenditure rose by 12 $\frac{1}{2}$ million francs, and the receipts were not sufficient to pay the fixed charges, there being a deficit of 3,000,000 francs. In 1913 the ratio of expenditure to receipts was 42.79 per cent, in 1916 it was 47.14 per cent, in 1917, 50.93 per cent, but last year it was 61.28 per cent.

SHIPPING. On Jan. 1, 1916, the French merchant marine consisted of 15,161 sailing vessels of 561,361 tons net, and 1939 steamships of 1,066,139 tons.

According to *Lloyd's Register of Shipping* in 1919 France had fallen to the seventh place in shipbuilding, not only coming after England, the British colonies, United States, and Italy, but also after Japan and the Netherlands. Before the war the ship traffic represented in weight about half of the total French trade, and in

value about two-thirds. Before the war France paid in freight to foreign vessels 414,000,000 francs and in 1919 she was paying more than 1,500,000,000 francs. During the war the merchant marine had suffered heavy losses, estimated at 922,000 tons, destroyed by the enemy out of a total of 2,500,000. Navy yards were turned into munition works for the production of supplies, not only for France, but also for her Allies. Their capacity was doubled and it was estimated that they could produce if they had the means at their disposal at the rate of from 400,000 to 500,000 tons a year.

Projects were formed during the year for the restoration of the French merchant marine. There were negotiations between the English and American government for the purchase of ships. The administrative council of the French ship-builders was engaged toward the end of the year on an arrangement with England which would provide more than 500,000 tons; and communications were entered into with the shipping board of the United States. Also plans for an arrangement with Canada were under consideration for the purpose of placing at the disposal of France steel vessels with a tonnage of 500,000, of which 40,000 would be immediately delivered and 72,000 before the end of the year. It was understood that the vessels would be built according to French specifications and under the control of French engineers and that long term credit under favorable conditions was granted to France. The arrangement with Canada had the advantage of promising entirely new vessels built in well-equipped ship-yards and by experienced workmen. The situation at the beginning of the year was serious, for France suffered greatly from lack of bottoms, but as the year went on the situation improved and, more and more offers presented themselves giving a better chance of choice. Toward the end of the year the prospects for the renewal of the French merchant marine seemed good.

FINANCE. The budget estimates for 1918 (exclusive of war expenses) were: Revenue, 10,064,657,897 francs; expenditures, 9,956,604,788 francs. The national debt on Jan. 1, 1919, was 147,472,421,289 francs, of which 116,874,224,289 was internal, and 30,598,197,000 external. Total fixed debt, internal, 67,738,554,789; floating, 49,135,696,500 (including National Defense bonds and advances by the Bank of France). Total fixed debt, external, 15,127,000,000; floating, 15,147,197,000.

FINANCIAL DISCUSSION. In March the following figures showing the financial situation were made public and widely circulated in the press.

August 1, 1914, to March 31, 1919	
France	
Expenses	182,000,000,000
Receipts, deposited or discounted....	158,000,000,000
Deficit	24,000,000,000

The above deficit would be increased by all the cost of demobilization. The following discussion by M. Charles Dumont, former Minister of Finance, is fairly typical of French opinion as expressed in the press in regard to the situation: Supposing the country should return at the end of 1920 to former conditions, the budget of 1921 must cover the permanent expenses by permanent receipts. Now the permanent ex-

penses of the budget of 1921 that were already certain amounted to 19,000,000,000 francs. France would have to pay out in 1919, 8,000,000,000. The important question was whether taxes would yield enough. France's resources were certain to increase as the years passed, and new taxes would surely have to be imposed, but it was evident that no financial expedient compatible with social welfare and healthy economic activity could raise France from her depleted and enfeebled condition. The question was not only financial; it was political. Germany was guilty of the world war. She had deliberately planned the crime of devastating Northern and North-eastern France, and the plans of Hindenberg to this effect had been applauded by the Germans in 1917, and after that the systematic destruction of agricultural and industrial machinery in the zone of occupation, and in the course of the retreat, had been deliberately and with general approval carried out. She therefore owed reparation to France. The Allies of France desired this and would insist upon it in the Peace Treaty. Now Germany would not be able to pay her debt in cash. She must draw upon her immediate assets so far as possible, but time must be allowed her for the payment of the balance. Annuities might have to be created to liquidate the debt. During this time the Allies of France ought to form a solid *bloc* of creditors. On this condition alone Germany would escape the temptation to refuse to continue payments as soon as she found herself strong enough, and in the presence of divided enemies. This would be the chief object of the League of Nations which must first of all assure itself of a complete reparation to the nations that had been the victims of the war. The Peace Conference would have to decide whether Germany should do more than pay for actual damages inflicted—whether in fact the cost of the war would not have to be borne in part by the Allies. The question before France was on whom rested the duty of paying the costs of the war if the enemy did not pay. On principles of justice all the Allies, according to their resources in the condition in which the war had left them, were responsible. This principle of international equity must triumph if the victory were to conform to principles of justice. The war was the affair of all the Allies, hence the expenses must be shared among them equitably. Those who had spent most were the ones who did the most to assure the others their safety and welfare. If the Allies did not share the costs of the war according to their abilities, Germany would proceed to ruin France, and would therefore realize at least a part of her ambition. In a just cause for which England and the United States gave their blood, they ought not to hesitate to give their money to the end that justice be realized. Thus the League of Nations must in the first place consist of a financial association which would guarantee the credits of the Allies as against the Central Empires, and if these Central Empires could not pay all, the League of Nations must liquidate the war debts by sharing them according to the resources of the members. This war debt could be liquidated in the course of a long series of years by means of notes and bonds bearing the signature of the combined Powers, secured by annual taxes over which international supervision would be exercised. It was not only the duty, but it was the interest of

the Allied nations concerned to establish a financial League of Nations during the interval. Down to that time the Bank of France owing to its great power, its experience in the matter of credit, and its large resources of gold, had been able to discount loans and taxes, and to advance to the government notes to the amount of 20,000,000,000 francs, while at the same time maintaining its notes at par. This was possible because every one knew that the government would honor its engagements with the bank. This would change completely, and the country would be ruined, if the government required the bank to issue notes that were not secured, that in fact were not redeemable. The government sustained by the public opinion must avoid this peril by rejecting any expense that was not strictly necessary; by imposing of essential taxes; and by the prompt placing of loans when necessary in the home market or in foreign countries. It had given assurance that this would be its policy. There was a sharp debate on the budget in March. M. Klotz, Minister of Finance, informed the Chamber of the extent of the deficit and said that the budget would be three or four times as heavy as before the war. There was a deficit of 10,000,000,000 francs in 1919 which he proposed to meet by an increase of direct taxes, the income tax, the liquidation of war stocks, and a change of the law in respect to the transportation of troops in France, whereby the Allies would be made to pay the cost of transport. He proposed either that rates of exchange should be internationalized or that the war debts should be pooled and guaranteed by a union of the Allies. This was urged as only fair to France for one of the two courses must be taken if she were not to be placed upon a worse footing than others in respect to the purchase of raw materials. These statements encountered bitter criticism as noted under *History* below. The explanation offered for the vagueness criticized in his report was that he was obliged as a member of the Peace Conference to limit himself to general statements in respect to matters upon which the Chamber desired specific information. In the summer the necessity of issuing a large loan was under discussion. M. Klotz, after making his calculations, declared that the cash on hand in the treasury would be sufficient until December 31st for meeting the expenses of the last quarter of the year 1919. There was much concern over the fact that subscriptions for the loan had not been opened before. The chief resources if not the only ones to be counted upon were the taxes and the bonds of national defense. If the returns from the taxes were assured, there was no need of disposing of the bonds, and certainly not at the rate of 2,000,000,000 a month, the figure on which the minister based his assurance to the Chamber that all payments of the second quarter would be made when they fell due. The floating debt was also a source of anxiety. This included short term loans and the creditors at the expiration of the term had right to demand reimbursement. Before the war it amounted to several millions. In the summer of 1918 it exceeded 32,000,000,000 and consisted chiefly of the bonds of national defense of which a large number were redeemable within six months. If the bond holders should demand redemption the treasury was likely to be embarrassed. On the date when all or part of this floating debt was

consolidated by the issue of perpetual *rentes* such as the 5 per cent of 1915 and 1916, and the 4 per cent of 1917 and 1918, this difficulty disappeared, for the holder of these securities could not demand the return of the money he had loaned the government. Thus was explained and justified the insistence of many financiers upon a consolidated loan. It was argued that there was no financial security for a state having so considerable a floating debt. When an individual owes to several creditors sums of money that may be demanded from day to day, his one resort is to find some large lender who will supply him with the means of paying off everybody and allow him a reasonable time for repayment, and the same really applies to governments. Moreover the French state had contracted many engagements with the British and American governments and had issued obligations running 10, 6, and 5 years. And although these were to fall due at later intervals than the floating debt, it was none the less necessary to have recourse to a perpetual loan for the purpose of payment. There was general agreement in recognizing that the government should make every effort to reimburse as soon as possible the Bank of France for the advances that it had made to the state. Not a single loan but a series of loans was required in order to substitute for the instability resulting from the heavy floating debt and the short term debt the better conditions which would result from a consolidated debt, and it was argued that the sooner this began the better. The government had declared that a large operation like this could be carried out only under conditions of better confidence.

The difficulties before France in the matter of financial recovery was the subject of constant discussion throughout the year in France and in other countries. The frequent recourse to the answer that Germany would pay, whenever a financial question was raised, ended by becoming ridiculous, and there were not lacking pessimists in France who declared as a matter of fact that Germany would not be able to pay anything. The Finance Minister, M. Klotz, went into the subject at some length in Parliament. He showed that Germany had engaged to pay without restriction for the devastation she had caused, for pensions, and for allowances, and thus already came to such a heavy sum that it would have been useless to add to it the 670,000,000,000 marks which represented the military costs to the Allies. As it was, Germany was responsible for a formidable amount whose figure was not exactly fixed, but which for France alone would exceed 200,000,000,000 marks, and since France was to have 55 per cent of the whole, the amount would be at least 375,000,000,000 for all the Allies. No figure had been written into the treaty, but Germany would not be able to escape this obligation. The Allies did not think it practicable to impose a figure that would penalize Germany, for this would certainly cause default. Germany had proposed the absurdly insufficient amount of 100,000,000,000 marks. Now as to the question of collecting the 375,000,000,000 marks for the Allies including the 200,000,000,000 for France, France needed the money at once, for she would be obliged to pay the pensions, allowances, etc., before she had received anything from Germany. Between now

and 1921 she would receive her share of the first 25,000,000,000, which share had not yet been determined, though the sum of 6,000,000,000 had been mentioned as payable exclusively in goods and equipment. France also obtained a portion not yet determined of 40,000,000,000 marks in gold, or 50,000,000,000 francs in German bonds, bearing interest at 2 per cent. After 1921 the International Committee on Reparations would estimate how much Germany could pay annually, and would make her pay it. The Finance Minister approved this arrangement as making an international organ responsible and this organ must not be confounded with that financial section of the League of Nations, charged with payment of the costs of the war, which as yet existed only in principle. The question was whether Germany could pay so large a sum as 375,000,000,000, and, if so, within what length of time. A period of 36 years had been granted to her and she would have to pay France interest on sums still due after each payment. Before the war she laid by each year 10,000,000,000 marks or about 12,000,000,000 francs. In view of the rise of price and the excess of production over consumption it might be now placed at twice this amount or from 24,000,000,000 to 25,000,000,000 francs. Germany would be able to pay this without ruining herself but evidently in this case she must work even harder than she had before on account of the loss of Alsace-Lorraine, and the Polish territory. As to her rate of exchange that would improve as production advanced. In short, it was necessary that Germany should become prosperous once more, for naturally she could not pay her debts if she had nothing to pay. This exposition of M. Klotz was criticized as optimistic and as taking for granted too many favorable conditions. It was recognized that the whole financial future of France depended on the financial capacity of Germany and her loyalty to her engagements, and it was questioned whether bad faith on her part could be overcome by the International Committee on Reparations. In short there was dissatisfaction in France with the guarantees of the financial clauses of the treaty in her interest.

TAXATION. In October, 1919, taxes and revenues (indirect), including monopolies yielded 831,501,000 francs, an increase of 32 per cent over the month before. Returns had steadily mounted during the year. During the first 10 months of 1919 they exceeded the budget estimates by more than 1,000,000,000 francs and exceeded the receipts for the corresponding period of 1915 by 2,359,999,500 francs. The budget estimates were exceeded also by the yield of the taxes on payments, transport, exhibitions and tobacco, and by the customs. The general tax in the first 10 months of 1919 yielded about 462,000,000 francs; wage and salary schedule, 59,000,000; industrial and commercial profits, 184,000,000; agricultural profits, 2,000,000; excess war profits, 1,176,000,000. The last-named figure was far behind the figure for England. From Apr. 1, 1918 to Feb. 1, 1919, the yield from the excess profits tax in England was £223,117,000, or at the normal rate of 25 francs to the pound sterling, 18,000,000,000 francs or over 15 times as much. The yield of the tax on payments (including luxury tax) increased as the months passed and the law was

more strictly applied. For the first 10 months of 1919 it amounted to 485,000,000 francs. There was criticism in France of the lack of a reasonable financial policy which corresponded to the national needs and it was said that all the taxes during recent months were ill conceived. The income taxes for example in order to be effective required three times as many supervisors as taxpayers. The tax on war profits simply resulted in the addition of the tax to the price of the product. The tax on luxuries was worthless. This was the point of view of a number of deputies who held that the whole system should be overthrown and replaced by something better. It was proposed by some that there should be a tax levied which would bring in quick and regular returns as for example the tax on all transactions. In the long run the consumer always pays and it was argued that there was no use in trying to avoid that contingency. It was idle to try and find a tax which would not bear upon the poor. The tax that every one had to pay was a just tax. There was opposition to the interference of the state in business after the war. That policy was criticized as too much on the order of German statecraft. At the end of the year for example the transport crisis in France was paralyzing all business activity. There was a strong demand on the part of the old-fashioned individualists that the state should restore to the railway companies and to the business men their entire liberty. To be sure the government had pretended to do so but under the pretext of the policy of favoring certain services as for example by the rule of priority for provisions and for goods destined for the liberated regions it continued to hold up the railway system. Government control was declared to result in intrigue favor and influence and a large number of political debaters were opposed to it.

FINANCIAL SOLIDARITY OF THE ALLIES. In financial circles in the United States and among persons who had returned from France, there was much comment on the alleged tendency of the French to depend too far on the financial support of the United States. It was said that the distress caused by the war had lowered the energies of the people and that there was a lack of initiative in regard to new enterprises, and a lack of the spirit of self-help. On the other hand in France many arguments were put forth to justify the participation on a large scale of foreign capital in the recuperation of France, not only for the sake of France, but in the interest of the foreign Powers themselves. The financial solidarity of the Allies was an expression constantly heard in the French Chamber. The position of the French may be indicated by the following outline of an article by M. Stephen Lauzanne: By financial solidarity of the Allies it was meant that the rich Allies of France and of course the richest of all, the United States, would assume a part of the war debt which fell on the poorer members of the Allies, and specifically that France, having spent 316,000,000,000 francs in carrying on the war, and being unable to recover more than 110,000,000,000 or 120,000,000,000 francs, should ask the United States to assume a part of the 200,000,000,000 francs that remained. This demand, frequently made in the Chamber and on the street, was echoed by the

ministers, but the latter took no definite steps in the matter, knowing well that such a demand would seem excessive to Americans. The American representatives indeed had declared that they could not see why this demand was made and that the American people would not understand it, and they produced the figures of the American loans to the Allies during the war, which aside from the costs of the war indicated that the United States already bore a large share of the burden. These figures totalled \$9,672,272,569 of which \$4,316,000,000 were loaned to Great Britain, \$3,047,974,778 to France and \$1,601,775,946 to Italy. They declared that for the United States to shoulder a part of the financial burden of Europe it was necessary to prove that Europe could not bear it herself. This proof was not produced and in fact no attempt was made to produce it. Thus in France values on the Bourse constantly rose during 1919. Now there appeared to be a large quantity of capital seeking investment in France, and the question was asked why the French Government did not appeal to its own capitalists instead of to those beyond the seas. In the United States it was pointed out that a certain number of French tax-payers had refused to fill out the tax blanks which had been sent to them under the French law, claiming that incomes ought not to be taxed. Now if French incomes must not be taxed for the payment of the French debt, why should American incomes be taxed for that purpose? One of the American representatives argued that before talking about financial solidarity, it was necessary to establish political solidarity among the Allies, and if some of the Allies disdained the opinion of others, they ought also to disdain the money of others. For example, it was hard to see how the financial solidarity of Italians and Jugoslavs could be established and endorsed by the United States. This did not mean that the United States disassociated herself financially from her Allies, and least of all from France. The United States accepted the principle of converting into a long term credit the loans that she had already made to France, and of suspending interest payments, which would amount to a new credit of 10,000,000,000 francs. Moreover, in various financial councils heard at Washington and New York, the United States showed a disposition to discount the bonds that Germany had engaged to give France in payment of the indemnity, which arrangement would guarantee that the bonds were not mere scraps of paper. Also several American cities had shown themselves ready to make substantial loans to French cities for their rehabilitation. In other words, the United States had shown willingness to come to the relief of France financially, but she had not shown willingness to enter into a system of financial solidarity with all the Allies or to consent to proportional regulation of the expenses or charges of the war.

At the close of the year official opinion in the United States held that the American government ought not to aid a European state unless it had taken the necessary measures to rehabilitate its own credit; and the following figures and arguments were repeated in the press: It was not just to tax the American people on behalf of a foreign Power that had not the courage itself to resort to radical measures of taxation. It was right to insist that the borrowing

country should establish a source of sound financial policy. In the United States, 36 per cent of the war revenue was derived from taxes, in England, 30 per cent; in France, 17 per cent. Paper money per capita in the United States was \$33, in England, \$50; in France, \$178. Certain guarantees must be furnished, especially a programme of economy and of rigorous taxation of wealth.

In France, M. Klotz had declared that down to December, 1919, the French government had already paid out for Germany 15,000,000,000 francs for the military allowances and 40,000,000,000 francs for the invaded regions. France was a creditor of Germany to that extent. Never before, said certain commentators, has the conqueror treated a conquered people with such clemency. "It depends on the Allied Powers to aid France in recovering that debt and from now on to aid her financially. During the war the British and Americans could not say enough about the heroism of France. Now that her heroism had won the victory, they told her to help herself the best she might and that they had other uses for their money. It was the duty of England, which had not been ravaged, and of America, which had suffered so little, to come to the aid of France, or if they did not like that term, to collaborate with her. After all it was wrong to speak of 'giving aid' to France. It was not a matter of aiding France, but of joining her in the defense of a common cause." These and similar criticisms were directed against the Anglo-Saxons. England was said to have gained rich territories by the Peace of Versailles and she was urged, as a matter of good policy to devote a part of the new resources to defraying expenses incurred for the common good. The same appeal was made to the United States, as a great nation uninjured by the war.

RATE OF EXCHANGE. In the first week of September the American dollar exchanged for more than eight francs instead of five francs, which was the average rate before the war, the pound sterling for 34 francs instead of 25 francs and the peseta for one franc 60. In the French press this was accounted for by various considerations. It was pointed out that in 1913 the excess of imports had been about a billion and a half, whereas in 1919 this excess for the first six months had reached the figure of nearly 10,000,000,000. That visitors and tourists who formerly brought their gold had not yet resumed their habit of traveling in France, and on this point the profiteers who had overreached the English and the Americans were condemned as tending to prevent the resumption. Before the war France had depended upon foreigners for its international transport service, and had to give several hundred millions a year for it. It could readily be imagined how much this had increased with the rise of freight charges and the falling off of the merchant marine since the beginning of hostilities. Before the war France had a capital invested abroad amounting to some 40,000,000,000 francs upon which it could draw for the payment of freight charges and imports. This foreign capital had for many causes greatly diminished, and as regards Russian, Turkish, Austrian, and other investments, had become entirely unproductive. On the other hand a great quantity of foreign securities had been loaned by individuals to the state which

had sold a considerable part in neutral countries in order to maintain the rate of exchange. Finally there was the inflation of the fiduciary currency, that is to say, the excess of paper money amounting to 35,000,000,000 bank bills. In the interior money was greatly depreciated, hence the general rise of price, and it was depreciated abroad also according as the currency was more inflated than in foreign countries. As to the remedies, the main requirement was production, the making of goods for sale, and the drawing of foreigners to France. Also long term credits must be obtained abroad. The question of foreign trade and the custom's tariff was also raised and the entire financial situation including the cost of living was involved. Naturally the five preceding years had thrown confusion into the whole economic system of the country. Exchange was still falling at the close of the year and it was pointed out that never before, even after the war of 1870 or during the Commune, had the franc sunk to so low a point.

ARMY. The effectives mobilized during the war are shown in the following table:

	Officers	Men
August 15, 1914	92,838	3,781,000
February 1, 1915	97,753	4,900,000
January 1, 1916	109,614	5,096,000
January 1, 1917	115,074	5,026,000
January 1, 1918	128,373	5,064,000

At the last-named date the infantry numbered 2,100,575; artillery, 899,845; aviation, 59,275; cavalry, 166,422; engineers, 185,110. Released from active duty for other service, 343,000, of whom 297,000 were engaged in agriculture and 8000 in instruction. The Minister of Finance supplied figures of expenditure as follows: 39,000,000,000 francs for artillery; 26,000,000,000 for shells and projectiles and 11,000,000,000 for the payment of the troops; total expenditure of the ministry was 119,000,000,000 francs. The organization of the future army was under discussion in France at the end of the year, but plans had not been settled. It had not even been decided what should be the number of divisions. Projects were put forward by military authorities involving the following points: The mainstay of the new force should be the men already engaged or to be reengaged, for they alone could form the nucleus of non-commissioned officers and specially trained troops. The number of these was placed at from 100,000 to 150,000. It was proposed that the rest of the army should be based on universal, obligatory, military service for not more than a year, and that it should consist of two halves, one called to the colors in October, and the other in April. It was also proposed that the diversity in training of officers should be abolished and that in place of the separate schools of Saint-Cyr, Fontainebleau, Saumur, the Polytechnique, etc., there should be a single school of instruction which would give a uniform education. It was argued that the war had been a war of trained specialists, and that the main school henceforth should be the Polytechnique, the others to be simply centres of application and perfection. With universal service it was necessary to have definite periods of training, and a better system than before 1914. The periods should be short, but intensive. No plan embodying these principles was adopted. In a report to a committee of

the Senate, M. Doumer made the following analysis of the nucleus of the future army: 30,000 non-commissioned officers destined for a military career; 20,000 non-commissioned officers and soldiers of the colonial forces stationed in France; 50,000 French soldiers engaged or reengaged; 50,000 foreign soldiers or North African natives. These figures represented the nominal estimates corresponding to the results of voluntary recruiting. The new plans were criticized in certain military quarters as inadequate. It was pointed out that the occupation of the Rhine provinces called for at least 80,000 men. There were in October, 1919, five divisions in the East or about 30,000 men. For the guarding of the prisoners more were required. For the various classes of administrative clerical work some 20,000 secretaries or employees were engaged. This would take away some 160,000 men from the 450,000, which would be supplied under the new system. There would remain only 190,000 to make up the units of the interior. This they said was too small a number. M. Doumer counted that these units would be reduced by half on a peace footing, and he placed the army corps at a single division in active service which would be increased when mobilized by division of reserves.

NAVY. Opinion as to the proper policy to pursue in regard to the navy was divided. On the one hand a considerable party favored the expansion of the French fleet to an extent that would impose a heavy cost on the nation. On the other hand there were those who went so far as to desire the practical extinction of French naval power on the ground of the expense involved in its maintenance. The views of specialists who had investigated the subject were set forth by the president of the parliamentary naval commission in November. He pointed out the marked inferiority of the French fleet as compared with the great naval power of England and the United States. France could put into the service seven dreadnoughts with a displacement of 162,000 tons, including four dreadnoughts of the type of *France*, and three of the *Bretagne* type. Italy had three of the *Julius Caesar* type and two of the *Duilo*, attaining 108,000 tons, but she also had control of two Austrian armed vessels of the *Viribus Unitis* type of 20,300 tons, and had under construction four armed vessels of the type of the *Caracciolo* type, of 31,000 tons each. If the two Austrian armed ships were assigned to her, and if she completed these four powerful units, she would have a displacement of 272,000 tons or 110,000 tons, in round numbers, more than that of France. It was proposed either that France should continue to completion the five vessels of the *Normandie* type, or that she should undertake to build units that were comparable to the best of other countries. The *Normandie* type, however, was already out of date, and was not up to the standard in speed, offensive power, or resistance to torpedoes. The building of better vessels depended on two conditions which were not at present fulfilled, namely, the enlargement of the basins and yards which at present were not adapted to the building of battle cruisers, or even armed vessels superior to the *Gascogne* series; and secondly, the possession of petroleum sources which would assure the country of adequate supplies in time of war. Thus France was far inferior to Italy, and

in respect to the United States and England the difference was of course immeasurable. As to the small cruisers and the flotilla craft France showed the same inferiority to all the Powers including Italy. France had only one torpedo destroyer which could bear comparison with any of the numerous destroyers of recent model which Italy possessed. Her flotilla craft had never been well armed and was inferior in speed. They had been badly damaged by the war. As to submarines France possessed 72 of which 27 were below the standard, while Italy had 69 of which only seven were below the standard. The reasons that had prevented France from building ships since the first of August, 1914, were obvious. France in order to repulse the German invasion had to mobilize all her men, including the older classes. It was a question of life and death which drew immediately to all the fronts the working men of the arsenals and shipyards. They had to be recalled soon afterwards to increase the production of cannons and munitions, and to build small craft to avert the submarine peril. It was argued that both the security of France and her position in the world required a moderate but effective naval programme.

GOVERNMENT. Premier and Minister War, Georges Clemenceau; Minister Foreign Affairs, Stephen Pichon, Minister Justice, Louis Nail; Minister Interior, Jules Pains. Minister Finance, Louis Klotz, Minister Marine, Georges Leygues; Minister Commerce, Industry, Posts and Telegraphs and Marine, Louis Dubois, Minister Public Works, Albert Clavelle; Minister Industrial Reconstruction, Louis Loucheur; Minister Public Instruction and Fine Arts, Leon Berard; Minister Colonies, Henry Simon; Minister Labor and Social Foresight, Paul Jourdain; Minister Agriculture and Provisions, M. Noulens; Minister Liberated Regions, Albert Lebrun.

HISTORY

ATTEMPT ON THE LIFE OF CLEMENCEAU. On February 19th, as the prime minister was leaving his house, five or six shots were fired at him by a man from among a group of people near the door. One of the shots struck M. Clemenceau in the shoulder, but did not inflict a serious wound, and after a few days' confinement at the hospital was reported to be fully recovered. On February 28th, he resumed his usual work at the ministry. The would-be assassin was promptly arrested. His name was Emile Cottin and he was described as an anarchist. His trial followed promptly and on March 15th the court-martial sentenced him to death. He received the sentence calmly, saying that he was glad to die for the cause of the proletariat.

PROFITEERS. A measure imposing heavy penalties on profiteering was introduced in the Chamber on February 5th. Conditions as reported in the press were serious. The new measure proposed that any one who caused an inflation of prices by holding up goods, or by raising the price fraudulently should be subject to from one month to three years in prison and a fine, and that the same penalty might be inflicted on those who even without fraudulent methods, but for the purpose of speculation, had raised the price above the natural market value. Persons not in business before Jan. 1, 1915, were liable to heavier penalties.

COLONIAL MINISTRY. The ministry of the colonies was reorganized by decree on June 29th in accordance with a new plan by which the colonial office was turned into a general agency of the colonies. The ministry of the colonies was established in 1894 and originally included, apart from the military direction and colonial administrative services, 13 distinct services grouped in an inconvenient manner. In 1911 this system was reformed under M. Messimy and the service was divided geographically, but again was found inadequate and cumbersome. The decree of June 29th removed the administrative services and attached them to a general agency of the colonies. It also re-grouped the colonies according to the conditions prevailing in them instead of geographical vicinity and it established new technical services for banks, economic questions, merchant marine, justice, and education. In detail the groups were as follows: (1) Indo-China and Madagascar, (2) West Africa, Equatorial Africa, and the Somali Coast; (3) autonomous governments, namely, Guadeloupe, Martinique, Guiana, St. Pierre, and Miquelon, Réunion, India, New Caledonia, and the French Establishments of Oceania; (4) personnel; (5) auditing, (6) military service; (7) secretariat; (8) accounting; (9) penal service; (10) colonial banks and customs; (11) inspector-generalship of public works for the colonies; (12) inspector-generalship of the merchant marine and of colonial transit; (14) inspector-generalship of health service in the colonies; (15) inspector-generalship of colonial public instruction.

MINISTRY OF BEAUX-ARTS. A governmental decree at the beginning of October effected an important change in the system of the school of Beaux-Arts by reducing the tenure of office to five years instead of for life, and it was the government's intention to extend this principle to the teaching of art in general and apply the same rule to the professors of applied art in Paris and provinces, to the directors of the national manufactures, and the professors of the Conservatory. This was proposed in order to render these art-teaching bodies more active. It had been found that in too many instances persons were appointed to their positions who were unable to carry on active work, and the teaching was thought to have suffered from the retention of many professors who had become old or for other reason incapacitated for duty.

POLITICAL PRISONERS. In the YEAR BOOKS for 1917 and 1918 will be found an account of the more celebrated cases of political offenses including the trials of Caillaux, Bolo Pasha, Malvy, Humbert, and Ahmeyreda and less conspicuous characters such as Turmel, Lenoir, Loustalot, and others. An account of the *Bonnet Rouge* and the death of Ahmeyreda and of the trial and execution of Bolo will be found in the 1918 YEAR BOOK. It was found upon appeal that the cases of Loustalot and Comby did not rest on sufficient evidence to justify their arraignment before the court of justice. The case against M. Turmel was terminated by his death. As to Humbert the case when it came to final trial was dismissed. As to Caillaux he was removed to the hospital on account of ill health and at the end of September decision on his appeal was rendered to the following effect: Against Joseph Pierre Marie Auguste Caillaux, 56 years old, it was charged that after the de-

laration of the war, especially in 1914, 1915, 1916, and 1917, he had made attempts upon the external safety of the state; that in France, and especially in Paris, by plots, schemes, and understanding with the enemy, he had supported hostile enterprises against France or her Allies, of a sort that favored the military plans of the enemy; that these were crimes punishable under the penal code and the code of military justice. The case of Caillaux was therefore returned to the court of justice, established by the decree of Oct 15, 1918. On October 23d Caillaux appeared before the High Court. In answer to the customary questions, he declared that for 20 years of his political life he had sought only the good of his country, and that his conscience was clear as to the policy he had pursued during the war. He denounced the prosecution for having stirred up popular sentiment against him, and characterized this policy as an attack upon liberty of thought. The High Court decided that the trial should begin on January 14th. As Caillaux's case developed, the charges against him narrowed down to this matter of intriguing with the enemy for a peace of compromise. The charge did not imply that he had been a German agent employed to bring about the defeat of France, but only that while his country was at war, he devoted all his energy and influence in France and abroad, and in his relations with the *Bonnet Rouge* to conciliate Germany. Although every government in France after the first of August, 1914, had with the virtual unanimity of parliament determined upon a victorious peace, Caillaux had associated himself with a movement for a peace of compromise. The case was still pending at the close of the year. Lenoir was condemned to death but was reprieved at the end while on his way to the place of execution at Vincennes. On October 24th, however, his appeal having been decided on adversely, he was executed at the Santé prison. He was ill at the time and had to be carried by guards to the place of execution. The charges against him arose from attempts of German agents in 1915 and 1916 to carry on a defeatist campaign. He was arrested after the case of Senator Humbert came up early in 1918 on the charge that he had paid M. Humbert large sums of money as an agent of the Germans, and had received about \$200,000 as a commission.

RATIFICATION OF THE TREATY. On October 2d the bill containing the ratification of the treaty was carried by 372 against 53. Its text was as follows. "The President of the Republic is authorized to ratify and cause to be executed the Treaty of Peace signed at Versailles June 20, 1919 by France, the United States of America, the British Empire, Italy, Japan, etc.—[here follows the complete list of the Allied Powers]—and Germany; and also the acts which complete the treaty, namely: The protocol, signed the same day by the said Powers; the arrangement of the same date between France, United States of America, Belgium, the British Empire, and Germany, concerning the occupation of the Rhinlands; and the treaty between France, the United States of America, the British Empire, Japan, and Poland." The Chamber then ratified without discussion, and unanimously the treaties concluded at Versailles between France and the United States, and between France and England, the text of this

resolution being as follows: "The President of the Republic is authorized to ratify and cause the execution of the treaties concluded at Versailles June 28, 1919, between France and the United States of America, and between France and Great Britain, concerning the aid to be given to France in case of unprovoked German aggression."

The analysis of the vote for the ratification of the treaty is simple. The number of voters was 425 of which an absolute majority was 213, while the actual majority was 372. The 53 who voted against it consisted almost exclusively of the Unified Socialists. The figures were as follows: 49 Unified Socialists, 1 Radical Socialist, 1 Republican Socialist, 1 member of the Radical and Socialist Republican Union, and 1 member of the Democratic Republican Entente. The Socialist group numbered 93. Of these 33 Unified Socialists abstained from voting. Among the others who abstained from voting were 18 Republican Radicals and Radical Socialists, and small groups of the Radical Left. The absent on leave numbered 20.

THE END OF THE CENSORSHIP. On October 13th the censorship which for more than five years had controlled the French press and had often given rise to charges of gross unfairness and inconsistency was officially declared at an end. It was probably the subject of more resentment than in any other country of the Allies. Charges were openly made against it on many occasions, but in general writers contented themselves with satirizing it under veiled allusions. It was generally known by the nickname of "Anastasia." It was directed by the Press Service of the war department, and dated from Aug. 4, 1914, when a decree was issued prohibiting the publication of any news in regard to events of the war, such as mobilization, military movements, embarkation and transport of troops, composition of armies, effectives, etc., that had not been previously submitted to the Press Service of the war department. The editors and proprietors of the various dailies and other periodicals had to submit final proofs of every issue to the war department as soon as the last page of their publication was set up. If upon publication any item was discovered relating to military information that had not been communicated to the Press Service, the whole issue might be suppressed. At the beginning, the purpose of the censorship was simply to prevent the disclosure of military information contrary to the national interest, but later the same control was extended to matters of diplomatic information. So long as the government press service or censorship was limited to the exercise of these definite functions, it was not criticized, but was on the contrary approved and seconded by the public. Soon, however, items were suppressed on the ground that they jeopardized in some manner the "Sacred Union" of all parties, creeds, and opinions which had been brought about in the face of national danger. This principle was naturally of a vague and elastic bearing, and it was believed to be often invoked on frivolous or merely party grounds. It was especially charged that the censorship was used to strangle any criticism or even discussion of the mistakes of governments and parliament, and to protect from attack any public man no matter what he had done. As a result the principle of the freedom of the press was en-

tirely neglected. Editors or proprietors of the various journals would be called up on the telephone to justify their right to publish matters that had nothing to do with the safety of the state. Many papers were published with large blank spaces pointing to the suppression of items, which actually were of no importance whatever, thus creating an air of mystery and causing unnecessary alarm. The censorship was accused of the most absurd caprices. For example, in an issue of the *Official Journal* of February 7th was published the mention of a Captain, a veteran of 1870, who was wounded for the first time at "X," had taken part in a charge under General Margueritte, was captured at "X," and escaped and finished his campaign in the army of "Z," etc. The letters had been substituted for names of places pertaining to the war of 1870. Many other equally absurd instances were cited by the French press. In April, 1915, however, the appointment of a new official in charge of the French daily papers led to an improvement in the system. The Service at that time comprised about 180 officials, including directors, censors, secretaries, etc., all of whom were military men and it was divided into three branches, namely, for periodicals, for daily newspapers, and for press dispatches, each branch being under the direction of a captain. The rules were communicated to the chief of the Service who entered them in a register which was supplied to each of the chiefs of division, who in turn communicated it to his various subordinates. The chief of the Service had the final decision upon all subjects. The articles censored were cut out and pasted in order that they might be checked up with the papers as published; this done, they were filed.

THE MUTINY TRIAL. The mutiny of the Black Sea fleet in 1918 had its sequel in the trial of the mutineers at Toulon. The verdict surprised the public by its mildness. Out of a dozen who were accused only three of the leaders suffered a serious penalty, and this was only from six to eight years detention. The greater part of the prisoners were sentenced only to a year or two in prison. The verdict was explained by some as due to the recognition that the mutineers were merely the instruments of persons higher up in authority, and that being ignorant and credulous their guilt was not of a serious nature. The comment of the conservative press pointed to certain Socialist members of Parliament as the real culprits, naming certain leaders such as Longuet, Brizon, Cochin, and Alexander Blanc.

THE AMNESTY. The subject of amnesty for all political and military crimes came up in October, and after a long discussion the amnesty law was voted on October 20th. Its provisions were as follows: Full and complete amnesty for all offenses committed before Oct. 17, 1919, by the mobilized troops before their liberation; by fathers and mothers who had a son killed or seriously wounded in the war; by widows of soldiers and marines who had died under arms; by wives of soldiers who had either been badly wounded or cited with honor. It was decided that the law should not apply to soldiers condemned for mutiny or for leaving their post in the presence of the enemy, or to deserters for more than three months at home or for more than six months abroad. Other exceptions were made having to do with forest fires and war

profits. There was a long debate on the question of amnesty for mutineers and for those who had abandoned a post in the presence of the enemy, except when they had refused obedience to the command to march against the enemy. The former minister of war, M. Painlevé, said that the so-called mutinies of 1917 were not of the nature of a plot, but had resulted from a state of exasperation. Certain executions, 25 in all, had taken place, not the great number that had been spoken of. There were also numerous sentences to forced labor and to the public works. Part of these sentences had been already served and he asked that the prisoners be pardoned. A plea was made for the mutineers of the Black Sea. Here, however, the minister of the marine declared that the case was altogether different, for these sailors had not served part of their term. Moreover, the question of discipline was more serious than in the army. This principle was approved. The question of the severity of the court-martials came up and the reports on this subject were declared to be exaggerated. From the beginning of the war there had been 107,000 condemnations pronounced by the court-martials for all sorts of crime, both among the civil population and the military. As there were 7,000,000 mobilized troops the proportion of the condemned was 2 per cent. As to the military prisons, etc., there were in all about 20,000 prisoners. In 1917 there had been 4585 pardons; in 1918, 12,671, without counting 5000 suspensions of penalties. Thus, it was argued, it could not be charged that the government had not been merciful toward condemned soldiers.

CRITICISM OF THE GOVERNMENT. Although the Chamber voted confidence in the ministry after the discussion of Dec. 30, 1918 when the policy of France towards the Peace Conference in respect to Russian intervention was defended by the ministry, the attacks on the government continued. They had mainly to do with the subject of demobilization and the Russian policy. M. Cachin of the Left condemned the government for standing before the world as an international reactionary. As to the demobilization the prime minister informed the Chamber that on February 15th, 1,200,000 soldiers would be discharged, and on March 31st, 2,000,000 more. In regard to the government's attitude toward Russia the Chamber was assured that it had not changed and Deputies were warned against raising useless questions about it during the Peace Conference. Nevertheless the opposition members during a debate on the credits in March joined in sharply attacking the government, aiming especially at M. Pichon on account of the Russian policy and M. Klotz on account of his financial programme, the main points in which are given above under *Finance*. It was reported that the French Minister intended to resign but he retained office nevertheless. The Chamber became restive on account of the lack of definite information in regard to the Peace Conference and in April discontent seemed to threaten the overthrow of the ministry. In both houses of parliament the government was warned against continuing to keep parliament in the dark in regard to the peace terms. The Chamber insisted that the budget could not be framed without knowing what indemnity was to be had from Germany. The government remained firm however and M. Pichon speaking

for the ministry definitely stated that the peace terms would not be submitted to parliament until they had been signed by the enemy. This raised the question of confidence and the Chamber voted confidence by 344 to 166. Meanwhile the government won support by its vigorous policy toward food speculators and profiteers and by favoring measures generally regarded as sane and progressive.

THE NEW DEMOCRACY. A new party was formed under the title of the New Democracy with a programme corresponding to the principles associated with M. Clemenceau, that is to say the crushing of Bolshevism, the purifying of politics, and the insuring of a responsible and competent government. The means which it advocated towards these ends were coöperation among all classes, separation of legislative and executive powers, and elimination of all red tape and political parasitism.

THE RADICAL PARTY. The Radicals and Radical Socialists held their congress at Paris, July 27. Its chief objects were to consider a programme and a report in regard to the doctrines of the party. The presiding officer made an appeal for the closest union of all sections of the party in the carrying out of its social and political purposes. The Radical Socialists of Alsace-Lorraine made a proposal which was accepted unanimously. It was to the effect that the German organization in Alsace-Lorraine must be completely destroyed, and the territory must form an integral part of France; that to that end legislation should at once apply to the departments concerned; that the French rule should be considered as having been in force in principle, and the application of the German law as a temporary exception, that the transition to the new system should be loyally carried out and a democratic policy worthy of the republic should be applied to the liberated departments. As to the attitude of the policy toward present questions, it was summarized as follows: The Radical and Radical Socialist party, being hostile to the reactionaries, conservatives, and disturbers of the peace, appealed to the good will of all and demanded the complete fulfillment of the duty of good citizenship. The sum and substance of their programme was the remedying of the ills due to the war, and the maintenance of the country in the place to which its sacrifices had entitled it. The representatives of the liberated departments offered a resolution which was voted unanimously, calling upon the party to give its earnest support to the earliest possible measures for the relief and reconstruction of the devastated regions, and especially to insist that the government be prompt in payment of damages to farmers, merchants and others who had suffered loss.

NEW SYSTEM OF VOTING. An electoral reform bill was passed by the Chamber in May and later with amendments by the Senate. Its main feature was the abandonment of the voting by districts (*scrutin d'arrondissement*) and the return to the general ticket plan (*scrutin de liste*). Another feature was the application of proportional representation in elections that gave no party list an absolute majority. Amendments to the measure providing for women suffrage were defeated by a considerable majority. From the year 1889 the elections were held on ballot by districts, but under the new system each department was to choose deputies in accord-

ance with its population, that is to say, one for every 70,000 inhabitants of French nationality. After dividing the population by 70,000 the remainder, if it was more than 37,500, was to choose another deputy and if its population entitled a department to more than six deputies, it was to be split into sections, each of which would choose three deputies. Under the old system there had been a second ballot for candidates who did not get an absolute majority, but this was abolished under the new.

THE APPROACHING ELECTIONS. The elections were fixed for November 16th. The mandate of the French Chamber had long since expired. It was elected in 1914 for four years. Of the Senate one-third of the 300 members elected for six years were to be reelected every two years, but this was not done on account of the war. Thus it was necessary to choose 200 senators and to elect the entire Chamber of Deputies. The strongest group numerically in the last parliament was the Radical Socialist, whose name, however, does not afford any clew to its political principles. The Unified Socialists, though important numerically, were divided: For example, the well-known war leader, M. Albert Thomas, withdrew with 42 others when the members of the Left under M. Longuet refused to support the war; and the majority had passed over toward a radical attitude and were accused of sympathizing with Bolshevism (see **SOCIALISM**). In the summer there was a plan for fusing the moderate parties against the Royalists on the one hand, and the extreme Socialists on the other. This would consist of groups which according to numerical strength in 1914 would have had a majority. As to the Royalists, reports in the press indicated that they had given up their fight against the republic. The imperialists of former times had virtually disappeared. It was said also that the Catholics had assumed a more conciliatory attitude and accepted the separation of the church and state. On the eve of the elections, the union of the republican parties for a campaign against Bolshevism and extreme radicalism had split off into groups in accordance with the shades of opinion of the members. The first group, consisting of the so-called republican bloc, refused admission to the candidates of the Right. Its leaders were members of Parliament opposed to M. Clemenceau, and included the anti-clerical group. Another party comprised all classes of republicans, including the nationalists and liberals, but excluded the anti-clericals. For while preventing the separation of church and state they disapproved of anything savoring of religious intolerance. Lesser parties were created by the issues of the election, among them the so-called New Democracy (see above), and the party of the Action Française. On every electoral list places were reserved for the veterans of the war. In certain districts the veterans published special lists. On the Socialist lists were placed only the names of those members of Parliament who had declared in favor of non-intervention in Russia, and in the Soviet government. The dissenting Socialists who had voted for the Peace Treaty and had not taken a firm attitude in favor of the Bolsheviks were accepted as candidates by the republican Left.

THE TREATY AS AN ISSUE. Before the October elections the main points under discussion

had to do with the treaty. In France the sharpest criticism of the treaty came from those who did not believe the terms were severe enough against Germany or strong enough to guarantee the future of France. The government was blamed for not having gone further in the very direction in which it was considered by liberal opinion and even by moderate elements in Great Britain and the United States to have gone too far. The main points in which the treaty was criticized in the French Chamber during the debates were as follows: The protracted course of the Peace Conference which resulted in bringing about great confusion in international relations. The weakness in the matter of the Saar Basin which ought to have been annexed unconditionally to France. The insufficient reparations exacted of Germany and the lack of the means of constraining her to pay. Here it was held that M. Clemenceau ought to have insisted on obtaining from the Allies economic and financial arrangements favorable to France. Insufficient guarantees of future security. Here Marshal Foch was quoted as having demanded the permanent occupation of the bridge-heads on the Rhine. Although the Socialists took the opposite position and denounced the treaty as ultra-nationalist, the sort of criticism that was generally expressed was in the spirit of the points above mentioned. The Socialists refused to take part in the Peace Committee because they wished to ignore the treaty; they considered it a treaty of violence.

The government was blamed for the discontent of Poland, and especially for failure to do justice to the Czecho-Slovaks and the Rumanians. The former were described as among the best and the most faithful friends of France who chiefly for this reason had been zealous supporters of the Allies. The Allies had decided to exact the payment of 1,500,000,000 francs from states which had been formed out of Austria-Hungary. The Czecho-Slovaks were to be made to pay 50 per cent of this sum on the ground that they could afford to do so, being practical, industrious, and economical. It was said that they resented this and there was an element in France which made much of it. The Rumanians were also discontented. M. Bratiano exasperated by the ill-will that he had encountered was obliged to resign. He complained that Rumania was completely misunderstood. In 1878 Russia acquired Bessarabia which had been torn from Rumania, who asked if the Allies were going to let the occasion pass for repairing this wrong. The Allies were criticized in the French Chamber for dealing too gently with Austria-Hungary and sacrificing the interests of Rumania. The policy of General Smuts was also criticized in France and it was asked whether England would proceed in her design of creating an Austro-Hungarian empire. She was accused of a policy of irritation against the Rumanians and also against the Czecho-Slovaks, and of preventing them from taking Budapest, with the result that Bela Kun was tyrannizing over the country. These are only a few examples of the criticisms in the Chamber and press. They were diverse and numerous, but in general followed narrower lines than in Great Britain or the United States, emphasizing always the danger that France and those countries which were especially friendly to her might not be getting all that they deserved. There

was comparatively little criticism based on liberal views or reflecting any of the sentiments in regard to democracy, open diplomacy, and the evils of imperialism, which had been heard during the war. To the liberals it seemed that the attitude of France, so far as their leading newspapers and parliamentary discussions expressed it, indicated that nothing had been learned from the war and that the old aims of European diplomacy were exactly as powerful as ever; in short, that morally and politically her principles were the same as those for which the entire world had been remorselessly condemning the Germans. The government's reply to its critics was in general that while the treaty was not satisfactory in all respects it was the best that would be obtained; that it was not the fault of M. Clemenceau that he alone could not determine the conditions of the peace. President Wilson had insisted upon the preliminary establishment of the League of Nations, and had put off for several months the working out of the treaty. President Wilson in conformity to his programme of the 14 points had opposed the annexation of the Saar Basin. Mr. Lloyd George and President Wilson had also insisted on other points and M. Clemenceau could not override them. In general there was little confidence in the League of Nations among Frenchmen, though they recognized its good points and gladly adopted it as a measure that might help to keep the world at peace. The real guaranty in their eyes was the special alliance of France with England and the United States. This, the government pointed out, was the work of M. Clemenceau.

M. ARISTIDE BRIAND. In the latter part of the year M. Briand was under discussion in the press as a possible successor of M. Clemenceau, and especial interest was aroused by an interview in September in which the former prime minister expressed his political views. He said that the *Union Sacrée* sprang from the war, and was in all respects admirable, and that it was necessary to prolong it as long as possible. Union for defense of national interest could exist, however, along with discussion of the different ideas before the nation, and no pretense of union ought to check that discussion. The choice of the new representatives of France in the approaching elections was of the greatest possible importance, for upon them depended in large measure the future of the country. If out of mistaken regard for the *Union Sacrée* France should choose a parliament without political principles or programme, the result would be disaster at home and discredit abroad. France must play her rôle as the torch bearer of liberty, social justice, and orderly progress. A dictatorship, whether collective or individual, was not to be thought of. Whether it came from the extreme Left or the extreme Right, France was certain to suffer from it. The extremists were saying that they did not wish to associate with any one. That was logical at least, but they would soon find that by themselves the task before them was too heavy. On the extreme Right, on the other hand, appeals were made for the *Union Sacrée*, but at the same time they said they remained monarchists and did not in any way renounce their hope of a return to the old régime. In effect they asked every one to forget his republican ideals. The country ought not to be the victim of this delusion. He hoped

that the electoral reform would supply the country with the means of declaring its will anew, more completely and clearly than before. It was now possible for the country by means of a larger ballot and proportional representation to give the voters the chance to decide, not only upon matters of small importance, but upon political ideas. The republican party united and solidified with a clear, bold programme could now avail itself of the suffrage, and maintain the conquests that it had made in the past—a programme including the revision of the constitution, in order to secure the executive power from division of authority and make it responsible and capable of governing under the vigilant and permanent control of the Chambers. There should be administrative reform also, largely decentralizing the administration, and providing for regional bodies where professional interests would be largely represented. Then there should be a financial reform that would enable France to encounter the vast financial problems following the war, and social reforms methodically worked out to systematize the relations between employers and workers. In many quarters these views were attacked as hostile to the Sacred Union, and alienating the members of the Right who had rendered good service to France during the war, and whose patriotism was unquestioned.

ELECTIONS. The elections of November 16 registered a complete triumph for the ministry. They were interpreted by the supporters of the government and by the leading newspapers as a distinct ratification by the people of the treaty of Versailles, and a repudiation of those elements which had attacked its terms and had blamed M. Clemenceau for his course in the negotiations. In certain elections the issue was squarely presented, as for example in the contest between M. André Tardieu and M. Franklin Bouillon, the former being one of the negotiators of the treaty, and the latter a determined adversary. M. Tardieu was elected. Another feature emphasized by the triumphant element was the complete overthrow of the Radical Socialists, which was interpreted as a proof that the country was disgusted with Caillaux, Malvy, and their followers, and that they approved the energetic course of M. Clemenceau against the so-called defeatists. In the department of the Sarthe which was Caillaux's own district, the entire Radical Socialist list was beaten. As to M. Clemenceau they regarded it as a complete vindication. They said that no one had ever before more completely embodied the spirit of the nation, and that both during the war and since he had really spoken for the people and soldiers of France. The success was also taken to indicate a spirit of unity in the country, for on the eve of the elections there had been formed the National *bloc* above mentioned against the so-called defeatist element of the Socialists and others on the extreme Left. The Socialist candidates were defeated. The Socialist party was attacked by the others for its course, both before and during the war. The Socialists were blamed for the unprepared state of the country, for the attacks that they made on the high command, and for the pacifist and pro-German tendencies of the element represented by Longuet and Brizon, also for the moral support accorded to Caillaux, and the systematic attacks on the Clemenceau ministry. But it was especially charged

against the Socialists that they had openly supported Russian Bolshevism, and the friends of M. Clemenceau laid especial stress on the elections as a pronouncement against this policy. It was said that the Socialists went into the contest with the support of the Bolsheviks. It was charged against leaders like Renaudel and Longuet that they had excluded from the party those who had contributed to the national defense, while they recognized as orthodox members all the pro-Germans and the Bolsheviks. In general the elections of November 16th were taken by the conservative party to mean that France insisted upon unity and peace with a view to regaining its former prosperity. It was a victory for law and order according to them. Work could not be resumed in the midst of revolutionary disorder. France had pronounced against the beginnings of the Social revolution. Bolshevism was a German invention and had served Germany during the war by taking Russia out of the Entente, and it would serve Germany during the peace if the revolutionary propaganda bore fruit among the victorious nations. In France it was plainly seen that this propaganda was at work just as it was at work in England and the United States. By the conservative classes the election was regarded as a definite stamp of popular disapproval on the disturbing tendencies. The attitude of the American press in general was about the same, for it did little more than repeat the conclusions of the conservative press in France which almost invariably rejoiced over the victory as a triumph of the moderate parties. One of the great French journals declared that now it was the true France which had spoken.

The *bloc* formed by the anti-revolutionary groups for the defeat of the Unified Socialists had been successful in that the people in general voted for anti-Socialist candidates. They did not, however, carry out the plan urged by the National Republican *bloc* and put forward a single list of candidates from among its members. There were generally two lists and often several. In spite of this division of anti-revolutionary forces the Unified Socialists were unsuccessful and the net result of the election was that an enormous majority of anti-revolutionists of one shade or another was returned. On the other hand the actual number of Socialists' votes appeared to have risen from 1,400,000 in 1914 to 1,700,000 in 1919; and it was argued that the old system of single-member constituencies would have resulted more favorably to the Socialists. This threatened to give rise to a claim on the part of the Socialists that an attack had been made on their interests and it was evident that they would appeal to the working classes and make as much as possible out of this grievance.

THE NEW CHAMBER. The Chamber after the elections was constituted as follows according to the estimates available at the beginning of December which however were defective because the returns from the invaded regions were not yet available and because the political opinions of a number of the deputies had not yet been ascertained: Unified Socialists, 55 including 25 new; Dissident Socialists, 5; Republican Socialists, 26 including 9 new; Radicals or Radical Socialists, 144 including 81 new; Republicans of the Left, 111 including 43 new; Progressists 106, including 35 new; Liberals 65 including 27

new; Action Française, 3 new; Independents, 3 new.

M. CLEMENCEAU ON FOREIGN POLICY. The session of December 23d brought an interpellation by M. Marcel Cachin of the extreme Left in regard to the results of the recent London conference, to which M. Clemenceau replied immediately. He said he would speak freely of everything except the question of military guarantees. He quoted Lloyd George's declaration that France and England must be bound together closer than ever and that this union would insure the peace of the world. As to the question of Fiume, the difficulty arose from the fact that it had been promised to Croatia and that this promise had been countersigned by Italy. At the London meeting, representatives of the United States, France, and England had summed up the point of view of President Wilson and a note to this effect had been presented to the Italian foreign minister. At the present moment Italy was making a final effort to reach an understanding. These were the results of his visit to London. He himself, he added, had taken a stand on behalf of Poland and Czechoslovakia. One of the last decisions of the Peace Conference had granted Eastern Galicia to Poland only for 25 years and by virtue of a mandate. As a result Poland had a grievance against the Entente. He had tried to have the matter reconsidered and Lloyd George had finally consented that a new proposal should be placed before the Conference and that the "character of a temporary mandate over Eastern Galicia be suspended." As to Russia he declared that no peace would be made or negotiations carried on with the Soviet government; that not only was its system barbarous and atrocious but that it had set up first a dictatorship and then a dictatorship of committees, and that it was based on a principle that "no French Chamber would ever accept." He referred to Russia's abandonment of the Allies in the war and to the enormous sums spent by France and England against the Bolsheviks in the hope that groups would be found endeavoring to defend their country and their liberty. These expenditures must now cease, "but as the Russian anarchy is incompatible with the establishment of a durable peace in Europe it has been necessary for the purpose of preventing the spread of the contagion to establish the so-called barbed wire blockade." It had been decided to form an alliance with every people attacked by the Bolsheviks, and to aid them by supplies of every kind. In respect to Rumania he regretted that she had not proceeded in harmony with her Allies but he said that this result had now been achieved. As to Constantinople he could not reveal the nature of the discussions, lest it might embarrass negotiations that were now in progress. The Chamber voted confidence by 458 to 71.

ALSACE-LORRAINE. The session of parliament of December 8th which marked the opening of the new Chamber was an important and significant event. The deputies from Alsace-Lorraine took their places in the parliament for the first time since the Franco-Prussian war. The address was made by a senior member, M. Siegfried, in which he paid tribute to the work of M. Clemenceau. The Alsace-Lorraine deputies were received with acclamations. Throughout the various formalities however a consider-

able number of members including Socialists remained seated.

FRANCE AND THE VATICAN. It was reported at the close of the year that plans for the resumption of diplomatic relations with the Vatican were under discussion at Rome between the government and the Vatican. They were however not of an official nature but merely preliminary. According to the reports in the press the Vatican was disposed to accept the separation of the church from the state in France but required a guarantee that this policy would not be carried out in a spirit of persecution. On the other hand the French government was represented as claiming that French bishops should henceforth be nominated only with the consent of the government and also that those bishops nominated while relations between the government and the Vatican had been interrupted should be recalled if their nominations were not acceptable to the government.

FRASER, SIR ANDREW HENDERSON LEITH British officer in the Indian service, died at Edinburgh, Scotland, February 26th. He was born Nov. 14, 1848, educated at Edinburgh University and entered the Indian civil service 1871. Among the important positions that he held may be mentioned that of Chief Commissioner of the Central Province (1889), president of the Police Commission (1902) and Lieutenant-Governor of Bengal (1903-8). He wrote *Among Indian Rajahs and Ryots*.

FRATERNAL INSURANCE. See INSURANCE.

FRAZER, COMMODORE REAH. Naval officer, died in Brooklyn, N. Y., December 30. He had seen 47 years' service in the navy. He was born in Lancaster, Pa., in 1853, and entered the service in his youth. During the late war he was disbursing officer at the Brooklyn Navy Yards.

FREER, CHARLES LANG. American capitalist and art connoisseur, died in 1919. He was born at Kingston, N. Y., in 1856 and engaged in railway work and manufacturing in Detroit, Mich. Having made a fortune he retired from business and devoted himself to the study of art, making a valuable collection which he afterwards presented to the Smithsonian Institution at Washington, along with a sum of \$1,000,000 for a building.

FRENCH ACADEMY. See ACADEMY, FRENCH.

FRENCH CONGO. NOW FRENCH EQUATORIAL AFRICA (q.v.).

FRENCH EQUATORIAL AFRICA. (Formerly FRENCH CONGO) A French colony in equatorial Africa, with Kamerun on the north west, Wadai on the north, Bahr el-Ghazal on the east, Belgian Congo on the southeast, and the Atlantic on the west. By convention, dated November 14, 1911, France agreed to cede certain parts of the colony to Germany, in return for German recognition of the French Protectorate in Morocco, the area ceded being about 107,270 square miles, with a population of about 1,000,000. The total area is about 669,000 square miles, containing a population estimated by the latest figures at 9,000,000 of negro and other races. The portion ceded to Germany has an area of about 6450 square miles. Sleeping

sickness is very prevalent in the district, and is fast decimating the population. Until recently, French Equatorial Africa consisted of three colonies, the Gabon, (capital, Libreville); the Middle Congo Colony, (capital, Brazzaville); and the Ubangi-shari colony, (capital, Bangui).

Financial and administrative autonomy under a lieutenant-governor with an administrative council obtains. On Apr. 12, 1916, the Chad territory, which had been a dependency of the Ubangi-shari colony, was made a colony. For 1918 the budgets showed the following figures: General budget, 3,960,000 fcs. Loan fund, 1,508,700 fcs. Port Gentil and Libreville, the chief ports, have considerable shipping. Two steamship lines visit these ports. The central African telegraph line connects Brazzaville with Loango, which is in communication with the English Atlantic cable. The total length of the line in operation is about 2366 miles. There are several mission schools with an attendance of 3600 pupils, and 94 public schools, with about 3900 pupils. The total imports in 1917 were estimated unofficially at 4,670,530 fcs. Exports, 3,662,275 fcs. The exports, in order of their importance, are: rubber, ivory, ebony and other woods, palm nuts and palm oil. On the northeast of Lake Chad, is the state of Kanem, which was completely subjected to France in 1903, and was recently made a district of the Shari territory, with Maô for its capital.

A French force occupies Arada, some miles to the north of the capital, Abeshr, which is in communication with Benghazi, on the coast of Tripoli by caravans. The province is under a governor-general assisted by a council of government.

FRENCH ESTABLISHMENTS IN OCEANIA. A colony in the southern Pacific Ocean, belonging to France, consisting of scattered groups and single islands. Estimated area, 3998 square kilometers. Population in 1919, about 81,200. Capital, Papeete, in the island of Tahiti. The Society Islands (Tahiti, and Moorea, the largest); the Marquesas, the French Leeward Islands, and the Gambier, Tubai and Rapa groups include the main groups. Vanilla and copra are the chief exports. Tahiti, the chief island, known mainly for its scenery and the material it affords many romantic writers, has as its capital, Papeete, with 3617 inhabitants, of whom 1909 are French. In 1918 there was a severe influenza epidemic, which recurred again in 1919, though far less serious, for the first epidemic wiped out nearly one-seventh of the population.

According to reports published at the close of the year 1919, the condition of the Marquesan islands showed that the administration had completely neglected them. Although they were the richest group belonging to France in the southern Pacific, they had plainly retrograded. The population fell off from 3117 in 1912 to about 2500, owing chiefly to the diseases which ravaged the country. There was no police service and there were no schools and steamers had ceased to run between the islands and Tahiti. Measures were recommended for immediate improvement of conditions, the main point being to give the group its own administration instead of leaving it under the administration of Papeete which was 750 miles away. Other measures proposed included the promotion of colonization by

the French and the creation of a marine transport service.

FRENCH GUIANA (CAYENNE). A colony and penal settlement on the northern coast of South America belonging to France. Area, 88,240 square kilometers (34,069 square miles). Population in 1919 according to unofficial figures, 49,231. Capital, Cayenne, which is the chief town and seaport, and had a population of 13,619 in 1919. Silver, phosphate and iron are produced in some quantities, but placer gold mining is the chief industry. The annual transportation to the colony averages between 4000 and 5000, and about 1000 to 1500 are freed each year.

FRENCH GUINEA. A French colony of West Africa. Capital, Konakry, with 6623 inhabitants. The chief commercial centre is Kankan. Other towns: Boké, Kindia, and Dubreka. The chief product and principal export is rubber. The value of the total foreign trade of the colony in 1918 was \$6,919,551, as against \$7,073,497 for 1917, a decrease of \$153,946. (In this report, francs are converted to dollars at normal exchange, one franc equalling \$.193.) The total imports amounted to \$4,444,785 for 1918, as against \$4,122,371 for 1917, an increase in value amounting to \$322,414. The total exports in 1918 were valued at \$2,474,766, as against \$2,951,126 in 1917. Movements of specie in 1918, included imports aggregating \$3088, and exports amounting to \$1,002,838. The share of France in the foreign trade of this colony in 1917, was 38.5 per cent. In 1918, 34.58 per cent. In 1918 there were 124 entries, with a tonnage of 153,246, and 7375 tons discharged. Of the total value of exports in 1918, France and her colonies received 67.11 per cent as compared with 68.28 per cent of the 1917 exports.

FRENCH INDIA. Five French dependencies in India, with an area of 513 square kilometers, and a population, estimated in 1919 at 268,952, by unofficial figures. They are Pondicherry, Caracao, Chandernagar, Mahé, and Yanaom. A senator and a deputy represent them in the French Parliament. Local revenue and expenditure (budget of 1918) was 1,963,500 rupees.

FRENCH INDO-CHINA. A French dependency in southeastern Asia, consisting of the following five states: Annam, (159,800 square kilometers, with a population in 1914 of 5,200,000); Cambodia, (175,450 square kilometers, with a population of 1,634,252); Cochinchina, (56,965 square kilometers, with 3,050,785); Laos, (290,000 square kilometers, with 640,877); Tongking, (119,750 square kilometers, with 119,720); also the leased territory of Kwangchow-Wan, (1000 square kilometers, with 168,000). Capital, Hanowi, in Tongking, with 113,676 inhabitants. Other towns, Cholon, 191,665; Binda, 75,000; Saigon, 72,000; Pnom-penh, 54,621; Hué, 65,000; Vien-tiane, and Haithong, 27,000 each.

Into Great Britain in 1917, the imports from Indo-China amounted to £73,514, and the exports from Great Britain, £637,276, chiefly cotton. In 1918, there were no imports and the exports amounted to £823,549. For 1918 the revenue and expenditure for the general budget balanced at 47,166,050 piastres. The outstanding debt of Indo-China, Jan. 1, 1917, amounted to 345,913,000 fcs. There was a military force that totalled about 25,514. There is a railway

from Saigon to Mytho. The total length of railway was 993 miles, according to the latest figures, 747 miles being government lines, and 246 miles private lines. There were 8719 miles of telegraph line, with 376 telegraph offices, and telephone systems aggregating 270 miles of line. There were 363 post offices.

The Bank of Indo-China, with an authorized capital of 48,000,000 francs and reserve and redemption funds amounting to 33,500,000 francs, has till 1920 the privilege not only of making advances on security, but also of engaging in financial, industrial, or commercial enterprise in Indo-China, and New Caledonia. The monetary unit, the piastre, is usually worth somewhat less than 24d. There are two bronze coins, one equal to 1/100 and the other 1/375 of a piastre. Various general movements toward the stimulation of production, the development of resource, and the betterment and enrichment of the country, are under way.

FRENCH LITERATURE. War literature was gradually crowded out of existence, or at least there were astonishingly vigorous attempts on the part of the writers as well as on the part of the public to reinstate in the place of honor non-war books. But of course the war was not an event that could be brushed aside, even in literature, and there were still enough war publications to warrant special treatment.

WAR LITERATURE. A large part of the war books should be classed under post-war literature, as dealing with problems of after the war. Such as, for example, Porché's play *La Jeune Fille aux Jours Roses*; after his great success with *Les Butors et la Fénêtte*, Porché tried a second allegorical play in which he makes fun of the bureaucracy of government officials, and of the pedantry of scholars, and wants youth to rejuvenate France. The play was very moderately successful. Many war novels deserve mention. René Bazin's *Nouveaux Oberlé* deals with the family problems in Alsace-Lorraine during the war the son who had cast his lot with Germany (in perfect good faith) finally understands that he was mistaken. Barbusse's *Clarté* is partly a reëdition of the realistic war scenes that made *Le Feu* famous, and partly the story of a man who saw "light." War made him realize that people have had nothing to say in matters of politics and that it would be better if they did have. Cyril Berger, in *Pendant qu'il se bat . . .* proves to be a disciple of Barbusse (who prefaced the book). And Léon Werth could perhaps also be called a disciple of Barbusse in *Clarté, soldat*, with much dialectic he reasons away from the surface of the globe such nonsense as patriotism, capital, charity, etc., and he dreams of a golden age with an anarchistic return to the life of nature (Rousseau converts him). More violent in tone is H. Champley's *Crève donc société*. The finest of the belated war novels is, by common consent, J. de Granvilliers's *Le Prix de l'Homme*; it can be compared with some of the very best war novels. A young man longing for something that will make life worth while finds that under no conditions as in war can he give so well the full measure of what is best and strongest in him; for stirring descriptions the novel is equally remarkable. Ch. Briand's *Le Sang* is in the same vein, almost mystic in its enthusiasm. A. Rédier (author of *Méditations dans la Tranchée*) offers a novel *Le Capi-*

taine in which he discusses how the soldiers who fought so well will now face the problems of normal life. In his *Grandgoujon*, a grotesque figure of a none too intelligent reservist during the war, R. Benjamin has not risen to the excellence of his *Gaspard*. M. Nadaud tells us the continuation of *Chignole's* story and the lamentable end of that hero of the air, in *Frangipane et Cie*. Two of the most admired books of the year were *Croix de Bois*, by Roland Dorgelès (Prix de la Vie Heureuse), and *Les Tranchées de Pelissanne*, which gives the description of a sunny town in Provence where they trained soldiers, especially "territoriaux," to dig trenches and throw grenades, written with exquisite humor by Paul Souchon. Very well received was Lamy Quantin's *Une héroïne limousine*, the scene of which is laid in turn in a town of Limousin and at the front. Gabriel Maurière's *tu Burlingue* (military office) gives in the language of a girl stenographer anecdotes of the military life in the rear, slackers' stories, etc. A woman, Annie Vivanti, in *Vae Victis*, treats with much pathos the problem of the "enfant du crime." Pierre Hamp, in his *Métiers blessés* tells of the awful industrial wounds of France, but in his usual strong and optimistic temper. Much praise must be given to Colette Yver's *Les Cousins riches*. The cousins who save from ruin a family of French manufacturers by their remarkable industrial skill typify Americans in their relations to France. It is a most intelligent study of the reasons why French and Americans in many ways complete each other wonderfully, but owing to some "mystère des races" would be well advised to mingle without mixing. We can only mention by title several other good novels dealing with the war, or after-war: J. H. Rosny, *jeune, Mimi, le profiteuse et le poilu*; René Dumesnil, *L'Absence*; B. Vallotton, *Ceux de Barivier*; Elie Dautrin, *L'Absent*; Louis Dumu, *'Nach Paris* Collections of short stories: Pierre Grasset, *Cocui et Guerre*; A. Arnoux, *Le Cabaret*.

Duhamel, the writer who owes the greatest debt to the war for the fame he acquired by it, publishes *La Possession du Monde*, in which he gives up story-telling for the philosophical considerations—probably to the regret of the public. His theory comes to this: Do not look for pleasures gotten by riches, or for conventional rejoicings, if the pleasure is in you, you own the world; moreover there is joy even in suffering.

Many interesting war diaries and descriptions were put on the market. Among the best were: Frères Tharaud, *La Relève*; Robert de Flers, *Carnet de Route*; Commt Raynal, *Fort de Vaux*; Tessan, *De Verdun au Rhin*; Rohidet, *Croquis de Guerre*; Laurentin, *Le Sang de France*; Delacommune, *L'Escadrille des Eperriers*; R. Milan, *Matelots aériens* (3d series of *Vagabonds de la Gloire*); E. Bourcier, *Bombardier Camus* (aviation); R. Jubert, *Verdun*; Fonsagrave, *En Battering*. Very painful are: Blanchet, *En Représailles*; Martin-Marny, *Quatre ans avec les Barbares* (in Lille); Dioulers, *Lille pendant l'Occupation*; and Niox, *Mes Six Evasions*. R. Legay contributes a good story of life at the rear in *Ronde des Bleuets*; in *Rouletabille chez Krupp*, G. Leroux gives a new series of his amusing detective stories. Judith Gautier has a pretty story of a young Belgian *Un Général de Cinq ans*. Also deserving of mention are:

Barres, *De la Sympathie à la Fraternité des Armées* (about America); Giraudoux, *Amica America*; Gyp, *Journal d'un cochon de pessimiste*; H. Ghéon, *L'Homme de la Guerre*, *Témoignage d'un Converti*.

Among the poets of the war may be noted: Rostand, *Le Vol de la Marseillaise* (of unequal merit); Verlet, *De la Boue sous le Ciel*; J. Normand, *Drapeaux Déployés*; J. Suberville, *Le Fils de Bernandoux*, and *La Posse aux Lions*; R. Hugues, *Cette Guerre*; Bourcier, *L'Âge de Nang*; Boyer d'Agen, *Cinq Paralipomènes à la Divine Comédie* (Terrets in honor of Foch, Pétain . . . the Kaiser, etc.); Edmond Fleg, *Mur des Pleurs*; L. Durtain, *Lise* (rustic tale of war time); and many others.

Literature on war literature: Baldensperger, *L'avant-guerre dans la Littérature*; Albert Schinz, *Le Roman Militaire en France de 1870-1914*. Jean Vic, *La Littérature de Guerre* (2 vols. of bibliography); finally a book of considerable importance, H. Esnault, *Le Poilu tel qu'on le parle*.

THE THEATRE. There is nothing that could suggest any common ground of inspiration; nothing original either, but rather the old themes and the old methods. In Sorbet's et Cahuet's *Roses Rouges* which deals with people who have been in the war, although the war has nothing to do with it, a nurse claims her rights to an officer's heart against a creature of low rank. *Pasteur*—a series of tableaux of Pasteur's life, written by Sacha Guitry the playwright for his father Lucien Guitry, the actor, presents an example of the French facing the period of reconstruction. Bataille's *Sœurs d'Amour* treats an interesting theme: A woman burning with love for one who belongs to another, suppresses her sensual love, develops one that is solely platonic, and tries to be a "soeur d'amour"; she is a Pauline "frénétique." Zamacoïs' *Monsieur Césarine*, *Ecrivain public*, is a delicate and romantic play of the Musset-Banville-Rostand kind. St-George de Bouhélier's *La Vie d'une Femme* on the other hand is of the tragic kind; while Géraudy and Laveline's *Princesse* has been called "Shakespeare for Boarding schools"; it is the story of a little princess who gives up her love for reasons of state—a new Bérénice. Gandera, author of rather risqué plays, surprises us by giving virtuous advice to young girls lest they be eaten up by wolves, in his *Chaperon Rouge*. Kistemaker, the powerful author of *La Flambee*, tries his hand very successfully on a farce, *Le Roi des Palaces*, the "roi" being a porter in a big hotel. Grivet gives a *Néron*; Kerst and Berteaux, *Loyauté*. A series of short plays have won praise, as Rivoire, *Sourire du Faune*, Courteline, *La Cruche*. As to Maurice Rostand's *Casanova*, it was hissed from the stage by unanimous consent of the critics. The Théâtre d'Orange opened again and gave *Horace* and *Les Voies Corinthiennes*. Hugo's *Mangeront-ils* (of the Théâtre en Liberté) and Banville's *Esopo* were put on the stage for the first time with remarkable results. See Brisson's *Théâtre pendant la Guerre*, and Mortier's *Dramaturgie de Paris*.

POETRY. A very abundant crop. The most discussed collections are by Jules Romain, some praising him to the skies (like Duhamel), but most critics being repelled by his conceit, the vagueness of the thought, and the difficulty of grasping the rhythm. In the first collection,

Europe, he asks: What of the old continent? the poet finds a lack of many things, but suggests no remedy; the second, *Puissances de Paris* is an attempt to discover the poetry of a street, of an autobus, of any public place where the "people" of modern Paris might reveal their originality; it sounds like obscure Whitmanism or warmed up Verhaerenism. Claudel in his *Messe de Là-Bas* sends from Brazil where he went on diplomatic service his contribution to the French poetry of the year; he also publishes a poetic dialogue *L'Ours et la Lune*. Francis Jammes, in his *La Vierge et les Sonnets* (26 sonnets) sings in his graceful way Notre Dame de Lourdes. The "Prince des poètes" Paul Fort continues his rapid production of *Ballades Françaises*, the two last volumes being *Les Enchanteurs* (Merlin and others), and *Chansons à la gauloise sur la rue, le rire et l'amour* . . . less and less gold and more and more sand. Out of the numerous titles the following may be mentioned: Spire, *Le Secret*; Moussiniac, *L'Echarpe dénouée*; J. Roux, *Lampe devant l'Autel*; Palgen, *Petits poèmes d'amour*; Roger Allard, *Appartement des Jeunes Filles* (songs of young love with no false shame), G. A. Masson, *Mille et unème Nuit* (Oriental poems); Supervielle, *Poèmes* (disciple and protégé of P. Fort); René Kerdyk, *Les Oiseaux Mutilés* (with interesting attempts at innovations in rhythm); R. Genty, *Les belles Amours* (style Watteau); G. Nigond, *Livre de Thomas Gagnepain* (pretty poems in honor of the man who tills the soil); etc., etc.; two good collections written by women: Yve Blanc, *Le long de la Route*; Baronne de Brimont, *Mirages* (with occasional bold innovations in versification).

NOVEL. Let us first mention two books of childhood memories by two of the best writers of to-day, Anatole France's *Petit Pierre*, (in the same vein as *Pierre Nozière* et *Le Livre de mon Ami*); and Pierre Loti's *Prime Jeunesse* (who had already written *Le Roman d'un Enfant*). Other volumes containing a good deal of autobiographical material are: Willette's *Mémoires*; Francis de Miomandre, *Volage d'un Sédentaire* (style of Sterne's *Sentimental Journey*); the Brothers Tharaud's *Rabat ou les Heures Marocaines*—one of the fine books of the year; Maeterlinck's *Sentiers dans la Montagne*, one more of those books of sweet humanitarianism to which he has treated us in recent years; Jean Aicard offers a sort of historical novel of great originality, *Gaspard de Besse*, a French Robin Hood of the eve of the Revolution, good to the poor and terribly hard on the lords; he died on the scaffold. Romain Rolland tries to reestablish contact with the reading public of France in a "neutral" book, written before the war, *Colas Breugnot*; it is a diary of a cabinet maker of the 17th century, suffering all sorts of mishaps at the hand of destiny, but going through it all with a joviality which is well-nigh heroic. Ch. Géniaux continues the series of gloomy novels that brought him fame with *La Famille Messal*; the story reminds one much of Balzac's *Recherche de l'Absolu*—a man of genius tyrannizes over his family and in their veneration for him they endure everything. A. Jaloux's *Fumées dans la Campagne* has received much praise—a rather intricate love story under the sunny sky of Provence. Francis Jammes speaks most gracefully of God to his public of mondains, in two novels, *Roses de Marie*, and *Le Curé*

d'Ozoron. Pierre Mille does not renew his style at all, we recognize Barnabas in the "ogre bon enfant" of *Nas'r Edin et son Epouse*. Abel Hermant dispatched another book, this time about a young Frenchman landing in Oxford and growing wildly enthusiastic over Whitman; it is called *L'Aube Ardente*. By way of contrast we may place here Estaunié, whose name spells quality against quantity, and who offers *L'Ascension de M. Baslèvre*. A. Lichtemberger in *Le Cœur est le même* tells with much humor the adventure of a scholar in the forties who falls in love with a very modern American girl. H. Bachelin has two more of his sober and excellent studies of the humbler classes, in *Serviteur*, and in *L'Eclaircie*, the story of a little hunchback girl peasant, who after a hard life sees in marriage a bright spot on the horizon. A series of books of a peculiar kind, evidently meant to react against the feverish unrest betrayed by so many writers, is Marcel Proust, *A la Recherche du Temps perdu*, which describe the sensations of a man who refuses to be hurried through life; his second volume is called *A l'Ombre de la Jeune Fille en Fleur*—a reverie in the style of the 17th century *carte de tendre*. An entirely different viewpoint is taken by Ch. H. Hirsch, who in his *Petit Louis, Boreur*, claims that "Tous les hommes seraient meilleurs si tous les hommes boraient." We now come to what may be considered the chief literary event in the domain of the novel, namely the rapid rise to fame of Pierre Benoit, with his two *romans d'aventure*, *Königsmark* (which is a romanesque spy story on the eve of the war), and *L'Atlantide*—a sort of combination of Stevenson and the Arabian Nights style. The success of the books leaves no doubt as to the taste of the public now, but it may be just a passing fad. Another book written by newcomers in literature has found much favor too, but rather with the educated public, *Le Livre de Goha le Simple*, by Adès and Jospovici. It is an exotic novel on Egypt and by two men who have lived in Egypt as Egyptians. Many have urged the Académie Goncourt to crown this book; but other novels have been proposed for the same reward, such as A. t'Seitewens, *Les sept parmi les Hommes*; Variot *Le Sens des Autres*, and several war books. Some of the best novels written by women this year are: J. Faure Favière, *Ces Choses qui sont vieilles*; Mme. Bruno-Ruby, *L'Exemple de l'Abbé Jouve*; H. Charasson, *Attente*; Mme. Raymonde Machard, *Tu Enfanteras*; Elissa Rhaïss, *Sâada, la Marocaine*. In this domain as in others the output has been enormous. At the risk of being unjust we venture to give a special mention to: P. Guitet Vanquelin, *L'Amour Exige*; G. Rageot, *La Faiblesse des Forts*; R. Chauvelot, *Roman d'Aventure à Jaja* (scientific approach to the problem of heredity); Andrée Mars, *Tu Aimeras dans la Douleur*; L. Verneuil, *L'Errcur*; Jeanna Landré, *Madame Poche ou la parfaite Créature* (a good caricature of the "femme gendarme" who has the best of intentions, but is a pest none the less). Children are the heroes in A. Machard, *Truque, Gamin de Paris*, and *Poucette, le plus jeune Détective du Monde*; also in F. Carco, *Bob et Bobette s'amuse*. P. Bourget has a volume of short stories, *Justicier*; and a posthumous volume of short stories by Mirbeau, *La Vache Tâchetée*, was published. Finally an edition of an early story by Jules Renard, *Les*

Cloportes, of 1889, shows us several first sketches of characters which have since become famous, as Poil de Carotte.

CRITICISM AND LITERARY EVENTS. Evidently a quantity of books ready in 1914 have now been thrown on the market, for many of these volumes presuppose long and arduous study impossible in time of war: F. Brunot, *Le Français en France et hors de France au 17me siècle*; Foulet, *Syntaxe du Vieux Français*; Hugo P. Thieme, of the University of Michigan, publishes his *Essai sur l'Histoire du Vers Français*. In the field of literature, Chamard gives a new translation of the *Chanson de Roland*; and Courbet an edition of *Poésies Françaises et Latines de Du Bellay*; Baupal, *Molière et ses Dévots*; L. Dimier, *Buffon*; Marquis de Roux, *Pascal en Poitou*; Marsan, *Beaumarchais et les affaires d'Amérique*; L. Ducros, *J. J. Rousseau* (vol. II and III); E. Seillière, *Les Etapes du Mysticisme passionnel*, (Rousseau, Chateaubriand, Stael, Byron); Jean Vie, *Idées de Dufresny* (editor of the *Mercur de France* in the 18th century); L. Pingaud, *Jeunesse de Nodier*; L. Vincent has four considerable volumes on *Georges Sand et le Berry*, *Marie Louise Pailleron*, *François Buloz* (editor of the *Revue des Deux Mondes* at the time of Romanticism) *et ses amis*; A. Poizat, *Le Symbolisme, de Baudelaire à Claudel*; E. Raynaud, *La Mêle Symboliste*; Gohin, *Œuvre de Samain*; J. de Suberville, *Le Théâtre de Rostand*; Pierre Gilbert, *Forêt de Cippes*, posthumous volume of criticism. He died in the war—was awarded the Prix de Critique by the Academy).

Literary discussions were plentiful. The most important was started by Lierre Louys, who suggests that the best in Molière's theatre belongs to Corneille (first article, in *Le Temps*, Oct. 16; book to be published by Fontemoing). The connection between the "livre cher" and the future of literature was much discussed, young authors being practically barred from the market. *La Nouvelle revue française* was started again, some hailing the manifesto of the editor Jacques Rivière as a masterpiece, some much disappointed in the programme of those who claim to represent the élite of the young intellectuals. *La Minerve* is a new periodical started by men already famous the world over, and there is a long list of new periodicals, many very promising: as *La France Nouvelle*, or *Le Progrès Civique*; of more directly in the literary line *Le Carnet Critique*.

The Grand Prix de Littérature went to the Brothers Tharaud; the Grand Prix du Roman went to Ch. Géniaux; the Prix Goncourt to Marcel Proust; that of *La Vie Heureuse*, to Roland Dorgelés. Quite a number of anniversaries were commemorated, especially the hundredth of the *Méditations* of Lamartine, and the fiftieth of Sainte-Beuve's death (which bring his works within the domain of public property). The following deaths are lamented: Demolder, the Belgian author of *Les Patins de la Reine de Hollande*; L. Tailhade; Ch. Morice; André Mithouard. The French Académie received Barthou, Fr. de Cnuel Boylesve, Jules Cambon, and elected Henri Bordeaux. The Goncourt Academy replaced Paul Marguerite by Emile Bergerat.

FRENCH SOMALI COAST. (SOMALI COAST PROTECTORATE.) French colony lying between the Italian colony of Eritrea and British Somali-

land, on the Gulf of Aden. Area, about 5700 square miles, and the population was estimated in 1917 at about 206,000. Djibouti had (1917) 13,608 inhabitants, of whom 294 are European, the main port and seat of government being Djibouti. The local budget for 1918 balanced at 1,759,539 francs. The salt mines opened in 1912 exported, in 1917, 11,962 metric tons of salt. The chief imports were cotton goods, butter, sugar, and galvanized iron, and the chief exports were coffee, ivory, hides, and skins. The total imports in 1917 amounted to 39,416,120 francs, and the total exports, to 50,324,846 francs. In 1917 272 merchant vessels, of 643,290 tons, entered. The colony is administered by a governor, assisted by an administrative council.

FRENCH WEST AFRICA. A possession of France in western Africa, composed of the following territories: Senegal, population in 1917, 1,247,979; Guinea, 1,812,579; Ivory Coast, 1,529,251; Dahomey, 911,749; Upper Senegal and Niger (Sudan), 5,598,973; Military Territory of the Niger, 850,094; Mauritania, 256,164; making a total of 12,206,889, of which the non-African races number 8020, French and foreign 894, making a total of 8914 for the non-African races. Of the African races the French number 12,191,413, and the foreign 6562, making a total for the African races of 12,197,975. The area in square miles is 1,745,000. A governor general, assisted by a council, supervises all of French West Africa from the seat of government at Dakar. Each of the colonies is under a lieutenant-governor, whose local authority is subject to the general direction of the governor general. The imports for 1917 were £7,024,336, and the exports £7,170,255. In 1916, 1825 vessels, of 5,119,558 tons, entered the ports of the colony. At the same time there were 263 post offices. The use of French weights and measures and money is compulsory throughout French West Africa. The governor general at the beginning of 1919 was M. Angoulvant (appointed Jan. 22, 1918).

Senegal is the oldest and most important French colony in west Africa, lying to the north of the British colony of Gambia, and its capital, St. Louis. Its representation in the French Parliament is one deputy.

French Guinea lies between Portuguese Guinea and the British colony of Sierra Leone. Capital, Kouakry.

French Ivory Coast, capital Bingerville, lies between Liberia and the British Gold Coast.

Grand Bassam, Assinie, Grand Lahou, Sassandira, Tabou, Thiejean, Bouaké, Aboisso, and other points in the interior are the chief centres of population and trade.

Dahomey, extending from Togoland, on the west to Lagos and Nigeria on the east, and to French military territories in the north, has about 95 miles of coastline. Capital, Porto Novo, with a population of about 20,000.

Upper Senegal, and Niger Colonies lie to the south of the Algerian sphere. Capital, Bamako. Population, 8734.

Mauritania was made a protectorate in 1903 and a special civilian territory in 1904. It comprises the districts of Brakna, Trarza, Gorgol, Assaba, Ticht, Levrier Bay, Adrar, and Tagant.

Imports and exports in 1918 according to British authorities were as follows, in pounds sterling: Senegal, imports, 11,417,026; exports, 8,307,470; French Guinea, 888,957 and 494,953;

Ivory Coast, 609,401 and 507,936; Dahomey, 1,133,077 and 1,199,473. For Upper Senegal and the Niger the imports and exports in 1917 were respectively 190,250 and 112,364.

FRICK, HENRY CLAY. American capitalist and manufacturer, died in New York December 2d. His death was sudden, and was attributed by his physicians to ptomaine poisoning. He was born in Overton, Pa., Dec. 19, 1849, and began work at an early age as clerk in the office of his grandfather, a flour merchant and distiller, but early interested himself in the coke business. In 1871 he organized the firm of Frick and Company with large holdings of coal lands, and coke ovens in the Connelsville region. During the panic of 1873 he purchased additional tracts and ovens and drew the interest of several leading financiers to his project. The Carnegies invested in the Frick Company, and in 1882 Mr. Frick was admitted as a member of their firm in return for giving them further interest in his business. From this time dated his career as a steel manufacturer. By 1889 he controlled coal lands and ovens representing two-thirds of the capacity of the Connelsville region. The Homestead strike of 1892 brought him into prominence. On July 22, 1892, an attempt was made on his life by the anarchist, Alexander Berkman, and Mr. Frick was severely wounded. His assailant was afterwards sentenced to the penitentiary for 21 years. In spite of his wounds Mr. Frick directed the measures against the strike, which finally subsided. He was chairman of the Board of Carnegie Company 1889-92 and afterwards chairman of the Board of Managers of the Carnegie Steel Company. Meanwhile he had become director of several other important corporations. In 1897 he became chairman of the Board of Directors of the H. C. Frick Coke Company, which was the largest institution of the kind in the world. In the Carnegie Steel Company he pursued a vigorous policy which brought in millions of dollars and greatly extended the field of operations. He built a railroad to unite the scattered plants, and saved enormous sums in freight to the company; and he subsequently took over the great Mesaba ore fields of Lake Superior. His subsequent attempt to buy out the Carnegie Company was unsuccessful. Mr. Carnegie then tried to exclude Mr. Frick from the business, and a complicated law suit followed, but the case was settled out of court by the reorganization of the Carnegie Company. It made Mr. Frick one of the wealthiest men in the country and his fortune was doubled soon afterwards as the result of the changes which Mr. Carnegie with the aid of Mr. Charles M. Schwab brought about when they secured the Morgan interest for the financing of the United States Steel Corporation in 1901. Mr. Frick's differences with Mr. Carnegie were never settled and the rivalry between them was the subject of much comment in the press. At his costly residence in New York City on the site of the old Lenox Library he placed a collection of pictures which was believed to be the largest private gallery in the world. He left according to the report of one of his executors nearly \$143,000,000 of which \$25,000,000 was left to his wife, son, and daughter, and the rest to public and philanthropic objects. The art gallery to be known as the Frick Collection, consisting of the Frick residence in New York and its contents and valued at \$50,000,000 was left to the

public, with an endowment fund of \$15,000,000 for its maintenance. The sum of \$6,500,000 was left to his daughter for expenditure in educational or charitable work, \$15,000,000 was left to Princeton University, \$5,000,000 to Harvard University, \$500,000 each to 15 other institutions, and \$2,000,000 to the city of Pittsburgh for a park.

FRIENDS, RELIGIOUS SOCIETY OF. There are four branches of this denomination: Society of Friends (Orthodox) with about 100,000 communicants; Society of Friends (Hicksite) with about 20,000 communicants; Orthodox Conservative Friends (Wilburite) with about 4000 communicants; and Friends (Primitive) with about 100 communicants. The Society of Friends (Orthodox) is the largest and most active. There is a Five Years' Meeting, quinquennial, composed of delegates from 12 of the 14 yearly meetings in the United States and one in Canada. The next meeting will be in Richmond, Ind., in 1922. Foreign and domestic missionary work is carried on by special boards. The denomination supports nine universities and colleges, among which Haverford College, at Haverford, Pa., is the best known. *The American Friend*, published in Richmond, Ind., is the official organ of the society.

During 1919 the Friends in both the United States and England combined for the purpose of doing relief work in France, under the head of the American Friends' Overseas Service Committee headed by Wm. T. Smith of Brooklyn. The Committee has sent a total of 650 workers to France, having raised an aggregate of more than \$2,000,000 for this work. These workers have taken the entire charge of reconstructing the area of devastated country between Verdun and the Argonne Forest, including the villages in the Forest itself. This is an area of something over 400 square miles and includes about 50 villages. Extensive reconstruction work in the area north of Chateau Thierry was also carried on. A small unit of 15 workers was sent to Servia to begin a piece of reconstruction work in agriculture and house building, and in the spring of 1920 the Committee plans to expand this work.

FRUIT GROWING. See HORTICULTURE.

FUEL. See CHEMISTRY, INDUSTRIAL.

FURS. See ALASKA.

GALICIA. Formerly an Austrian province in the Austro-Hungarian Monarchy; bounded on the north by Poland, on the east by the Government of Podolia in the former Russian Empire, on the northeast by Volhynia (in Russia); in the south it touches Bessarabia, and in the southeast it is separated from Hungary by the Carpathians. Population, Austrian census of 1910, 8,025,675. No later statistics are available than those given in preceding YEAR BOOKS. After the armistice and during 1919, its status was indeterminate, being one of the problems before the Peace Conference, on account of the claims of Poland to Eastern Galicia. A proposal under discussion at the close of the year was the formation of two self-governing states out of Eastern Galicia beyond the frontiers of Poland but under a Polish protectorate. See WAR OF THE NATIONS.

GALVESTON FLOOD. See the article HURRICANES.

GAMBIA. A colony and protectorate of British West Africa, on the River Gambia. The

colony proper has an area of 4 square miles and a population of 8000; the protectorate an area of 4500 square miles and a population of about 200,000. Capital, Bathurst on the island of Saint Mary. Imports of merchandise in 1918, \$4,473,927, exceeding those of 1917 by \$1,088,077. Great Britain supplied over 73 per cent. Exports of merchandise in 1918, \$4,296,143, a decrease of \$340,698 from 1917. Great Britain took nearly 95 per cent. There was a notable increase in the trade with the United States which supplied 15.43 per cent of the imports in 1918, as against 7.24 per cent in 1917. This seems to have been due largely to the shortage of foodstuffs in Europe. Revenue in 1917, £117,977, expenditure, £14,519. Governor at the beginning of 1919, Sir Edward John Cameron.

GARBAGE AND REFUSE DISPOSAL.

Garbage utilization by feeding to hogs has been increasing rapidly ever since the war began to stimulate food conservation. Most of the garbage feeding has been done by contractors who adopted this means of disposal because it promised a quick turn over of capital at a good profit on account of the short time required to fatten hogs and their high market price. Relatively few cities have established feeding plants but many have encouraged contractors to do so, since it promised the cities more favorable contracts than any other method of disposal and at the same time contributed to waste utilization and food production. Although garbage reduction plants, by recovering grease and fertilizer base, are also a means of garbage utilization, not a single new one was reported as having been built in 1919, while a number of cities changed from reduction to hog feeding. Likewise, garbage incinerating plants had few additions during the year, and none of size, while many existing furnaces stood idle, most of these having been previously shut down. The swing to hog feeding promises to continue for at least a few years longer, after which reduction may regain at least some of its lost ground. This depends upon the prices of labor, material, and capital, all of which bulk much larger in reduction than in hog feeding plants.

Large cities that changed from reduction to hog feeding in 1919 are Baltimore, Newark, Buffalo, and St. Louis, the first three of which made contracts which base the price they are to receive for their garbage on the market price for fat or killing hogs at Chicago. Utica, N. Y., and Akron, Ohio, also changed from reduction to feeding. At Minneapolis, St. Paul, and many smaller cities hog feeding was continued. At New York City the largest garbage reduction plant in the world stood idle, and the garbage from the major part of the city was dumped at sea, while one proposition after another for some means of disposal was discussed by the authorities. A variety of conditions more or less peculiar to New York contributed to the situation there, which includes not only the idle reduction plant named but also another one, built by an earlier contractor under one of the short-term garbage disposal contracts that have been so baneful. In passing, it may be noted that under the new city charter for Philadelphia, effective in 1920, that city is empowered to let garbage-disposal contracts for a longer time than one year, and is required to collect its garbage and clean its streets by its own forces unless a

majority of the new city council and the mayor vote that the work be done by contract.

HOG FEEDING CONTRACTS. The vicissitudes of garbage disposal in American cities are illustrated by the experiences of *Baltimore* which, finally guided by one of its municipal engineers, let a contract for disposal by feeding, effective May 1, 1919, which was expected to net the city \$16,500 annually, with no allowance for collection, but after deducting the cost of barging the garbage from central stations to the hog feeding plant. From 1882 to 1901 *Baltimore* garbage was barged to a point 6 miles from the city by a contract and spread on farm land as a fertilizer. From 1902 to Jan. 1, 1908, a contractor collected the garbage, hauled it to the water front in the heart of the city and treated it by reduction, at a yearly total price of \$147,300. Owing to complaints of non-collection and of odors from the disposal plant, the city bought the collection equipment and reduction works for \$372,888 in 1908, assumed the collection of garbage, but let a contract for disposal at \$85,000 a year, less \$10,000 a year for the use of the reduction works. This continued until the close of 1917, when the disposal contract was renewed, except that no allowance was made to the city for the use of the disposal plant. During 1919, three attempts to let a new contract for disposal only were made before success was attained. The first bid was from a contractor who offered the city 35 cents a ton for the garbage but was barred by the Capital Issues Committee from building a proposed reduction plant. Next, alternative bids for reduction and feeding were invited but none for either method were submitted, although under reduction the city offered its own plant for remodeling and use until a permanent reduction plant could be built. After the armistice, the city again advertised for alternative bids for reduction and hog feeding, offering to deliver the garbage to the disposal plant in either case. For reduction, bids were asked on a base price of 8 cents a pound for grease, the price to go down or up with the market price. No bids for reduction were received. A contract for feeding was let, the price per ton of garbage to be $3\frac{1}{2}$ times the average monthly top price per pound of live killing hogs on the Chicago market. Including a large recently annexed district, the area of *Baltimore* is 80.5 square miles and the population is estimated at 720,000. From the 670,000 population of 1918 there were collected 51,324 tons of garbage. During the same year 16,464 dead animals were also collected. The hog feeding contract at *Buffalo* also followed a long period of disposal by reduction under various contracts and was not awarded until after a long series of negotiation. The price per ton is 6, 7, or 8 times the price of live killing hogs at Chicago, depending upon the quantity of garbage, but a minimum of 50 cents a ton is fixed. At *Newark*, a reduction contract was terminated by the contractor in 1916, on the ground that the city did not enforce the contract requirement that householders must exclude miscellaneous refuse from their garbage cans. Municipal collection has since been the practice, the garbage and other refuse being mixed, until a new separation ordinance was put in force in 1919. The mixed refuse was dumped on meadow land owned by the city, a contractor paying \$3000 a year for the privilege of salvage at the dumps,

besides keeping the dumps in good condition. *Newark* delivers its garbage to the new feeding plant built by the contractor on the Passaic River, and for each ton receives eight times the Chicago selling price for live killing hogs—the highest price paid by three cities which have contracted for garbage disposal on this price basis, which has been characterized as “taking the gamble out of garbage,” in contrast with the old flat rate prices which might prove to be unfair to either the contractor or the city. Sheep as well as hogs utilize the garbage of *Utica*, N. Y. When the disposal contract there expired, on April 1st, the reduction contractor raised his price from \$5100 to \$8000 a year for disposal. A rival contractor offered to take the garbage collected by the city for a payment to him of \$3100. He has a farm of 160 acres, and feeds the garbage to 1600 pigs and 200 sheep. This contractor breeds his own pigs. Some other contractors do this and still others consider it more advantageous to buy young pigs. *Akron, Ohio*, which changed to feeding in 1919, is one of the small number of cities which have ventured to build a municipal reduction plant, which was put in use early in 1916. After operating it for a few months, the city leased it to a company, at a yearly rental of \$8200 (valuation, \$116,000). At the same time the city contracted for garbage collection for five years, at \$3 12 a ton. The reduction company enlarged the plant from 15 to 45 tons’ capacity. In 1918, reports of the two companies showed, there was a loss of about \$5000 on collection and a profit of about \$1000 on disposal, making a net loss to the dual company of about \$4000 a year on the collection and disposal of 10,142 tons of garbage. The city felt that the collection service had been poor and there was said to be nuisance in the operation of the disposal plant, although this was attributed to the character of the plant and not to its operation. In January, 1919, the disposal company notified the city that because the city had failed to pave the approach to the plant (really due to inhibition by the Capital Issues Committee) it would terminate the contract on March 1st and shut down the reduction works. The city paid for improvements to the plant and bought out the collection equipment. In April the reduction works were damaged by an explosion, so a marketable product could not be turned out. Estimates for an improved and larger plant on a new site showed a probable first cost of \$472,000 and a new annual charge of \$34,700. It was decided to secure bids for disposal by feeding and toward the end of the year a five-year feeding contract was let, under which the city will receive 85 cents a ton for the bulk of its garbage delivered to a reloading station. At *Lansing, Mich.*, municipal garbage feeding plant has been in existence since late in 1917, when a citizen’s committee having demonstrated the success of the plant turned it over to the city. About 4000 hogs were being fed in 1919.

LEGAL DECISION. A mooted point in garbage collection and disposal is whether a city can prohibit private collections. The Massachusetts State Supreme Court (123 N. E., 684) decided that a *Boston* ordinance prohibiting such collection was in the interest of public health and a valid exercise of the police power. The courts of other States have ruled some one way and some another, the negative rulings being sometimes based on the allegation that garbage is

private property and that a city can go no further than require it to be collected and disposed of in a sanitary manner. The question is of importance where either a city or a contractor is treating the garbage by reduction or is feeding it to hogs, in which case the largest possible volume of garbage is desired, particularly the rich garbage from hotels and restaurants.

GARDENING. See HORTICULTURE.

GARDENS, WAR. See AGRICULTURAL EXTENSION WORK.

GARDINER, COLONEL ASA BIRD. Lawyer and military officer, died at Suffern, N. Y., May 28. He was born in New York City, Sept. 30, 1839, and graduated at the College of City of New York in 1859. He served with distinction in the Civil War and in 1872 the Congressional Medal of Honor was awarded to him for gallantry and distinguished conduct during the Gettysburg campaign. In 1873 he was made major and judge advocate in the regular army. He retired in 1888. During his military service he discharged among other duties those of professor of law at West Point, and acting Assistant-Secretary of War (1887-88). He was district attorney for New York County, 1897-1900, and was a conspicuous figure in State affairs. He was counsel in a large number of important cases including those of General Grant and General Sheridan in the Warren Court of Inquiry and criminal cases affecting the army and navy. He was prominent in Tammany Hall and a leading figure in Democratic politics. Among his writings may be mentioned the following: *The Writ of Habeas Corpus as Affecting the Army and Navy* (1874); *Practice and Proceedings of Courts-Martial* (1878); *The Rhode Island Continental Line of the Revolution* (1885); *The Order of the Cincinnati in France* (1905).

GARRIGAN, PHILIP JOSEPH. Roman Catholic bishop of the Diocese of Sioux City, Iowa, died at Sioux City, October 14. He was born in Ireland about 1840, and after coming to the United States in his youth was educated in the public schools of Massachusetts, and at Saint Charles College, Maryland; subsequently studied at Saint Joseph's Provincial Seminary then at Troy, N. Y., and on June 11, 1870, was ordained priest. He was director of the Troy Seminary, 1872-75, pastor in Fitchburg, 1875-88, then served on the staff of the Catholic University at Washington till 1902, when he was made bishop of Sioux City.

GASOLINE. See AUTOMOBILES.

GAUL, GILBERT WILLIAM. American painter, died in New York City, December 21. He was born in Jersey City, N. J., March 31, 1850, and studied art under John G. Brown and L. E. Wilmarth, 1872-76. His specialty was in historic and genre paintings and he won many medals for his work, including those of the Paris Exposition in 1889, and the Chicago and Buffalo expositions.

GEMS AND PRECIOUS STONES. The value of precious stones produced in the United States showed a steady decrease over the period from 1916 to 1918. There was a decrease from \$217,793 in 1916 to \$131,012 in 1917; the figure for 1918 was given at \$106,523. The precious stones having the most value in 1918 were: Corundum, \$42,414; turquoise, \$20,667; quartz, \$15,211; opal, \$6304; tourmaline, \$6206. The total value of diamonds and other precious stones imported into the United States in 1918 was

\$22,666,839, excluding pearls, which had a value of \$765,929. Unset diamonds to the value of \$7,734,150 were imported in 1918,—a marked decrease from the value of \$18,421,838 in 1917. No domestic exports of gems or precious stones were recorded for 1918. Foreign precious stones reexported from the United States in 1918, with pearls reckoned in, showed a value of \$43,121.

GENUNG, JOHN FRANKLIN. Professor emeritus of Amherst College, died at Amherst, Mass., on October 1st. He had been a member of the faculty of the college for 37 years, and was widely known as the author of text books on rhetoric and of essays. He was born in Willseyville, N. Y., Jan. 27, 1850; graduated at Union College in 1870, and after teaching for two years studied at Rochester Theological Seminary, where he graduated in 1875. He officiated for three years as a pastor in the Baptist church, then went to Germany where he studied in the University of Leipzig, pursuing courses in English and Hebrew. He entered the Amherst faculty in 1882, became professor of rhetoric and English literature in 1889, and of literature and Biblical interpretation in 1906. A few years before his death he had retired from active work. As a teacher he was admired for his inspiring interpretations of literature, especially of poetry. His earliest work as a student in Germany had been in this field, and the best known of his published writings dealt with it. They include: *The Epic of the Inner Life, Being the Book of Job; What a Carpenter Did With His Bible; Practical Elements of Rhetoric; Tennyson's "In Memoriam," Its Purpose and Structure; The Passing Self; The Hebrew Literature of Wisdom in the Light of To-day; The Idylls of the Ages; The Select Essays of Elia; Words of Koheleth; and a manual of Biblical Literature* (1919), published shortly before his death. His work on rhetoric became a standard in American education. Besides the books above mentioned, he published many articles and essays, and was the editor of the *Amherst Graduate Quarterly*.

GEOGRAPHICAL SOCIETY, AMERICAN. A society organized in 1852 for the furtherance of geographical research. From November, 1917, to December, 1918, the Society was the headquarters of the body of experts known as the Inquiry, which later attended the Peace Conference and served on the various territorial and economic commissions. The maps that were made by the Society for the Peace Conference were also used in most of the colleges of the country at which the Students' Army Training Corps had been established. In 1919 the Society conducted an economic survey of the boundary between Guatemala and Honduras under the auspices of the Department of State, Washington, D. C., and on behalf of the governments of Guatemala and Honduras who desired a technical study to be made as the basis for a recommendation by the Secretary of State for a final boundary in the disputed region.

Another feature of interest in 1919 was the awarding of the Cullum Geographical Medal to Emmanuel de Margerie of Paris, France, now Director of the Geological Survey of Alsace-Lorraine, and to Harry Fairfield Osborn, President of the American Museum of Natural History, New York.

The Society publishes two magazines. The *Geographical Review*, a scientific periodical, gives the latest information in the fields of geographi-

cal research and exploration. It also contains a monthly record of geographical events throughout the world and bibliographical section covering the whole field of geographical literature. The second publication is the *Journal of Geography*, the only magazine specifically prepared for the use of teachers of geography. In addition, the Society publishes an atlas of "War Maps," prepared in connection with the work for the Peace Conference as noted above, and an annual monograph, sent free of charge to all Fellows of the Society. The membership included in 1919, nearly 4000 Fellows. The officers for the year were: President, John Greenough, vice-presidents, James B. Ford, Paul Tuckerman; foreign corresponding secretary, Prof. William Libbey; domestic corresponding secretary, Archibald D. Russell; recording secretary, Hamilton Fish Kean; treasurer, Henry Parish. The Society has its headquarters at Broadway and 156th St., New York City, and Dr. Isaiah Bowman is the director.

GEOGRAPHIC SOCIETY, NATIONAL. A national scientific organization, with headquarters in Washington, D. C., founded in 1888 for the increase and diffusion of geographic knowledge, especially through its organ, the *National Geographic Magazine*. Its principal scientific undertaking of the year was a sixth expedition to the Valley of the Ten Thousand Smokes region of Alaska, under the leadership of Dr. Robert F. Griggs, the leader of the Society's previous expeditions to that region, and the discoverer of the remarkable valley. Fumaroles so hot that their gases ignited wood were found; a previously unexplored arm of the valley was investigated; a hundred miles of uncharted or erroneously mapped coast line was surveyed and charted, and a new harbor was found, together with a better, shorter, and safer route into this part of Alaska. A collection of incrustations, gases, and lavas was brought back for laboratory study, and the processes of reforestation of an ash-devastated country were investigated further, with many striking lessons for the botanist. A sportsman's paradise of great natural beauty and flowing with game, was discovered in the region immediately north of the Valley of the Ten Thousand Smokes. In his report on the expedition, Dr. Griggs says that by the analysis of the material brought back, it is hoped that new light may be thrown upon the composition and condition of the materials of the earth's interior. Among the outstanding issues of the *Magazine* during the year was a full number devoted to the dogs of the world by Ernest Harold Baynes, illustrated with 73 color pictures by Louis Agassiz Fuertes, also a number devoted to the history and illustration in color of American military insignia, past and present. The membership of the Society is now approximately 700,000, making it numerically the strongest scientific society in the world. Its Director and Editor is Gilbert Grosvenor.

GEOLOGICAL SURVEY, U. S. See **ENGINEERING**.

GEOLOGY. At the Baltimore meeting of the Geological Society of America, discussion centred largely about the practical phases of the science, its bearings upon industry and its various technical applications. These have been set forth in previous reviews for the *YEAR BOOK*, so that they hardly need to be referred to more particularly at this time. The discussion, however, served to

indicate very clearly the trend of recent work toward increasing contact with the economic field. The address by Whitman Cross, the retiring president of the society, gave a survey of the developments during the war, which more than anything else within the last few years encouraged specialization in the fields of applied geology. The outcome has been a wider appreciation of the value of scientific work in the public service, but at the same time some apprehension may be felt lest the emphasis thus given to practical studies should diminish the interest for general research upon which scientific progress really depends.

MAP OF BRAZIL. In the field of regional geology no more notable contribution has been made in many years than the map of Brazil, with its accompanying description and bibliography, the work of J. C. Branner (*Bulletin Geol. Soc. Am.*). The magnitude of the task involved in the preparation of a geological map covering a country so extensive and varied in physical features as Brazil will be readily appreciated by fellow scientists, and for others it may be said that the author gave more or less of his time to the work for 45 years. Considerable areas within the map limits still remain to be explored, but the broader features in regard to the nature and succession of formations have been indicated with a degree of fullness that was hardly to be expected in view of the rather meagre resources available for geological exploration in that vast country. The scale of the map is 1 to 5,000,000, or approximately 80 miles to the inch.

GLACIAL GEOLOGY. The absence of any evidences of extensive glaciation in the mountains of Southern British Columbia was noted by J. B. Tyrell (*Jour. Geol.*), thus revising the conclusions of some of the earlier geologists who probably had less experience in this field. It would appear that no continental ice-sheet invaded the Cordilleran region as far south as latitude 53° or 54°. Local mountain glaciers were in existence during the Pleistocene and they were competent to produce all the observed effects of erosion and moraine accumulations. The conditions in Northern British Columbia have not been sufficiently examined to determine whether the ice sheet spread over that area.

The influence of winds in their relation to the distribution of land and water deserves consideration as a factor in producing glacial climate, according to R. M. Deeley (*Geol. Mag.*). The present arrangement of the continents makes for a poleward flow of the air from the temperate zones, thus moderating the temperatures in the arctic zone. If the polar regions in Pleistocene times had been land, the cyclone currents would have been reduced in strength and their equalizing tendency diminished; this would have extended the limits of arctic climate, superinducing as well the accumulation of an ice-cap that advanced southward with the lowering of temperatures. The periodic alterations of climate, which are not considered to have characterized the Pleistocene period, may be accounted for by variations in strength of the cyclones in response to changes. The theory has some merit apparently, even if its statement fails to meet all the difficulties presented by the problem.

CONDITION OF THE EARTH'S INTERIOR. In a summary of the more recent investigations of the conditions existing in the depths of the earth,

R. D. Oldham (*Geol. Mag.*) found the weight of evidence to indicate that three distinct regions occur, each characterized by different physical relations: (1) An outer crust of solid rocks, relatively thin, probably representing not more than one-two hundredth part of the radius; (2) a shell about one-half to three-fifth of the radius, consisting of material that is neither solid nor fluid in the ordinary usage of the words, since it is rigid under stresses of short duration but capable of indefinite yielding to stresses of small amount extended over long time periods; (3) a central nucleus of matter that has little or no rigidity even against stresses of short duration. The condition of the nucleus may be described as fluid, though whether essentially liquid or gaseous need not be argued. From the standpoint of its component materials the earth may be described as an envelope of stony materials surrounding a core that is principally metallic, largely iron, which core represents from three-fourths to four-fifths of the entire radius. Crustal movements indicated by mountain folds and great faults that have been held to represent adjustments of the outer shell to a cooling shrinking core may not be so explained. They are too irregular in distribution to accord with this principle, furthermore they involve too large quantities for such forces. No adequate cause has been found as yet to account for them, but it is recognized that adjustments are facilitated by the abrupt change from the solid rock crust and the incompetent zone below. The temperatures reached in the earth's interior are a matter of speculation. It would appear, however, that the gradient of 1° to 25 meters observed in the superficial zone is no more than would be expected from the radium content of rocks. That the innermost regions may be cold, approaching the absolute zero temperature of space, is not an impossible condition.

MOUNTAIN BUILDING. The mechanical features of mountain folding was described by R. T. Chamberlin (*Jour. Geol.*) on the basis of recent exploration in the Colorado Rockies. An estimate of the crustal shortening over a distance of 140 miles across the axis of the main uplift showed the total amount to be 8 miles. The original uplift was probably about 13,000 feet on the average above the datum plane, taken at 1500 feet above sea level. On the basis of these results, the depth to which the strata were affected by the squeezing can be found by dividing the product of the length of the section into the uplift by the amount of shortening that resulted. The calculated depth of disturbance was found to vary in different parts of the section from a minimum of 13 miles to a maximum of 107 miles, the greatest depths being below the granite ranges. Compared with the Appalachians the Rocky Mountains have undergone less plication, but more vertical lifting with a thicker shell involved in the movement. Moderate folding of a thick zone would seem to accomplish the same vertical bulging as more violent convolution of a thin shell. Volcanic activity prevailed to a greater degree in the Rocky Mountain disturbance than during the Appalachian upheaval, perhaps owing to the deeper zone involved.

The development of the coast and Sierra Nevada ranges of California, according to Bailey Willis (*Bulletin Geol. Soc. Am.*), may be ascribed to compression that has brought about

rotation of the mountain blocks along high-angle faults. This method of uplift is indicated by the existence of consequent streams on the old surface and by normal faults following directions along which tilting causes a downslip of the blocks. The upward movement took place along a high-angle thrust that curves downward to a low angle below the block and extends seaward many miles. The cause of rotation was stress set up by erosion and sedimentation, a stress insufficient to produce mass movements in the sub-crustal region, such as are involved in isostatic adjustment, but inducing crystal orientation and foliation of the rocks. This orientation varies from horizontal under loaded areas to vertical in areas lightened by erosion, forming a curve that rises from great depths below the ocean to the continental border zone. The planes of foliation mark directions of weakened cohesion along which slipping may occur without involving such stress as would be demanded by mass movement.

IGNEOUS ROCKS. The process of crystallization of igneous magmas was discussed by N. L. Bowen (*Jour. Geol.*) with reference to the production of variations in the resulting rocks, or as it is termed igneous differentiation. The agency of crystallization, an inherent force resident in magmas, appears to be more effective in causing variations than other possible causes like convection currents, liquid immiscibility or melting of foreign materials. There are two stages or the crystallizing process, an early stage when crystal settling takes place and a later stage when a separation of the crystal mass and the residual liquid occurs as result of the squeezing out of the latter by pressure. The one or the other operation, or their combined agency, serves to explain the effects of a cleavage or differentiation of the magma.

OOLITIC STRUCTURE. The origin of oolites and spherulites may be explained according to W. H. Bucher (*Jour. Geol.*) on the basis of Schade's discoveries of the method of formation of urinary calculi. Oolitic and spherulitic structures are assured when a substance passes from the state of a colloidal emulsion to a solid; if the suspended substance be pure a crystalline radial arrangement results and if impure a concentric one. The spherical shape arises from the tendency of the droplets that form in the process of separation to coalesce, whereas the difference between radial and concentric methods of aggregation depends upon the amount of impurities thrown out with the growing particles.

ROCK ANALYSIS. A method for the rapid estimation of mineral percentages in rocks was described by A. Johannsen (*Jour. Geol.*). It is based on the employment of the camera lucida in combination with the microscope. A projection of the field seen in the microscope is obtained on a drawing board where the boundaries of the mineral particles are traced by a planimeter, thus recording the area occupied by each substance. The equivalent volumes are then obtained as they have the same ratios as the areas in any uniform rocks. The volumes can be reduced to weight percentages by dividing the products of the respective specific gravities and individual volumes by the total weight.

OIL GEOLOGY. The derivation of petroleum was ascribed by A. G. McCoy (*Jour. Geol.*) to the solid organic matter (kerogen) of shales. Black bituminous shales, essentially the same as

the oil shales of Colorado, Wyoming, and Utah, accompany the oil pools of the Middle West. The oil is driven off by pressure rather than by heat, at a depth corresponding to rock pressures of 5000 or 6000 pounds to the square inch. After the oil once forms it is collected in porous rocks, usually sandstones, by water moving under capillary forces which invades the shales and dispels the oil. The existence of cross-fractures and faults is necessary to admit the water to the deep zones, which accords with the observation that the oil collects on the sides and flanks of anticlines, where the rocks are most likely to have been ruptured.

M. L. Fuller (*Econ. Geol.*) called attention to the relation existing between oil distribution and the fixed carbon ratio of coals, confirming the vein of David White that no oil or gas of commercial value may be looked for in strata that contain coals of a high fixed carbon content. The limiting ratio is about 70 per cent. In the Texas field 60 per cent may be regarded as the practical limit. The boundary between the productive and barren area of that State runs from the Red River in Montague County south and west parallel with the margin of the Cretaceous strata to McCulloch County south of the Colorado River. Oil in varying quantities, though absent to the east of this line, should be encountered at shallow depths to the west between the 60 and 55 per cent curves and farther west between the 55 and 50 per cent curves at greater depths. A region of abnormal disturbance is to be inferred from the high fixed carbon ratio in the Cretaceous area, perhaps a buried Paleozoic land mass.

The remarkable oil developments in Central Texas were described by W. G. Mattison (*Econ. Geol.*). The principal producing strata belong to the Bend series of Mississippian age and in nearly all fields the position of the oil pools bears a close relation to the surface structure. The most favorable conditions for the occurrence of oil in quantity are presented by cross-folds superimposed on the flexures that resulted from the uplift which produced the Bend arch, the direction of the two systems of folding being nearly at right angles. Besides structural relations the condition of the sands has to be taken into account in locating pools, for if the sands are thin or of compact nature dry holes result even with favorable structure. The flow of oil so far has not been attended by salt water, which feature is favorable to a long life for the pools.

SALT RESOURCES. A report on the salt deposits of the United States by W. C. Phalen (*Bulletin U. S. Geol. Surv.*) added much to previous knowledge about these important resources. The investigation was undertaken primarily with the view to testing the brines and rock salt for potash, but this apparently does not accompany the beds to any extent, except in one or two of the dry lakes of the Great Basin. There are no occurrences of potassium compounds so far discovered that compare with those of Prussia and Alsace which previous to the war practically supplied the world's requirements of these indispensable materials. The resources of salt, however, are ample and well distributed over the country, no less than 15 states possessing workable deposits of rock salt, with natural brines occurring in several others.

ORIGIN OF ORES. The principles governing the formation of ore deposits were discussed in a number of papers, mainly collected in the issues of *Economic Geology*. B. S. Butler gave examples of the relation of ore distribution to faulting from the Wasatch district of Utah, where some of the more important deposits occur in the brecciated zones produced by thrust faults. The intersection of such zones by vertical fissures especially afford a favorable environment for ores; the deposits result from the replacement of the breccia by mineralizing solutions that circulate along the fissures. Taconite—the ore bearing rock on the Mesabi range—owes its origin to precipitation in shallow waters, probably influenced by organic processes, according to Frank F. Grout. The accumulation was subjected to alternating periods of solution and oxidation, thereby giving rise to conglomerates and granular rocks much higher in iron than the primary material. Recrystallization later occurred under the stimulus of heat and pressure superinduced by deep burial of the beds. Gold ores deposited by igneous agency were described by H. C. Cooke from the Matachewan district, Ontario. The ores are restricted in distribution to the contact zone of granite porphyry, the intrusion of which was accompanied by pegmatite as the last differentiation product. The crystallization of the pegmatite minerals left magmatic solutions rich in lime, iron, sulphur potash and gold, which by reaction with the wall rocks formed replacement deposits of calcite and gold. The action of deep-seated igneous rocks was concerned in the formation of the Missouri barite deposits, according to W. A. Tarr, who reviewed the conditions surrounding the occurrence of barium and pointed out its general association with igneous materials as the primary environment. The limestones in which the barite is now found contain very little barium, too small a quantity to have yielded the supply represented by the deposits; they have also little permeability for solutions except along joint planes, so that circulations of surface waters would hardly have been efficient mineralizers, especially as they have low solvent effect upon barium salts. W. J. Miller described the occurrence of magnetite in the Lyon Mountain district of the Adirondacks and explained the deposits as concentrations effected by the agency of more mobile portions of a magma that is now represented by the granite country rock. The source of the iron is referred to the magnetite and iron-bearing silicates of an earlier gabbro that was invaded by the granite. For reviews of Volcanology and Seismology, see VOLCANOES and EARTHQUAKES.

GEORGETOWN UNIVERSITY. A Roman Catholic institution for the education of men, at Washington, D. C. There were enrolled in the university in the fall of 1919 2102 students, and the faculty numbered 205. The library contains 100,000 volumes. Georgetown was founded in 1789. President, Rev. John B. Creeden, S.J.

GEORGE WASHINGTON UNIVERSITY. A non-sectarian co-educational institution established in 1821 at Washington, D. C. In the fall of 1919 the enrollment was 3416, and in the summer it was 677. The faculty contained 287 members, 55 being added during the year. Productive funds amounted to \$158,753.22 and the income for the year was \$319,161.67. The

library contained 54,000 volumes. During the year the following gifts were received: \$25,400 from Abram Lisner, Esq.; \$5000 from Col. Robt. M. Thompson; \$1000 from John Hays Hammond. The university also acquired three lots for the extension of its plant. President, William Miller Collier, LL.D.

GEORGIA. POPULATION. The population of the state in 1910 was 2,609,121, and on July 1, 1919 it was estimated to be 2,975,394.

AGRICULTURE. The following table is compiled from a report of the Federal Department of Agriculture.

Crop	Year	Acreage	Prod. Bu.	Value
Corn	1919	4,820,000	69,890,000	\$111,824,000
	1918	4,590,000	68,850,000	113,602,000
Oats	1919	540,000	10,800,000	12,420,000
	1918	550,000	11,000,000	13,090,000
Wheat	1919	240,000	2,520,000	6,628,000
	1918	280,000	2,856,000	7,597,000
Hay	1919	557,000	a 613,000	15,509,000
	1918	696,000	a 863,000	20,280,000
Peanuts	1919	202,000	5,050,000	12,423,000
	1918	314,000	8,792,000	14,067,000
Potatoes	1919	23,000	1,610,000	3,494,000
	1918	28,000	1,610,000	2,978,000
Sweet Pota	1919	142,000	13,064,000	14,370,000
	1918	130,000	11,960,000	14,950,000
Cotton	1919	5,288,000	b 1,730,000	309,670,000
	1918	5,341,000	b 2,122,000	291,831,000
Tobacco	1919	31,000	c 16,430,000	8,582,000
	1918	4,500	c 3,600,000	1,656,000

EDUCATION. The school population in 1918 was 810,861; the enrollment was 679,747, and the average attendance was 452,064, with the average length of the school year at 130 days. There were 15,172 teachers, with an average monthly salary for grade schools, ranging from \$70 to \$26; for high schools, from \$109 to \$31. The total fund raised for public schools was \$7,619,267; the grand total raised for educational purposes for colleges, common schools, and secondary work amounted to \$9,904,880.

TRANSPORTATION. The total railway mileage of the State for 1918 was about 7343 of single main track; of this, 14 miles were constructed by two companies in the year.

OFFICERS. Governor, Hugh U. Dorsey; Secretary of State, H. B. Strange; Treasurer, John W. Eagleson; Auditor, E. G. Gallett; Attorney General, Roy L. Black.

See COTTON; AGRICULTURAL EXPERIMENT STATIONS.

GEORGIA. A former province of the Russian empire, now a republic. Its status in its relation to the Bolshevik government is uncertain. Its independence was recognized in January, 1918. From June 1, 1918 to July 1, 1919, the foreign trade was as follows: Imports, 366,897,167 rubles; exports, 257,559,000 rubles. The chief imports were agricultural produce and foodstuffs and the chief exports, tobacco and tobacco products, wine, brandy, and spirits.

GEORGIA, UNIVERSITY OF. A State institution of learning, located at Athens, Ga. In the summer of 1919 there were 1017 students, and in the fall the enrollment was 1131. There were 71 members in the faculty. Income for the year amounted to \$379,168. A new building at a cost of \$60,000 was erected as a women's dormitory. The library contained 43,250 volumes. The institution was founded in 1801. President, David C. Barrow, LL.D.

GEORGIA SCHOOL OF TECHNOLOGY.

A State institution for the technical training of men, at Atlanta, Ga. Enrollment for the fall was 1375; for the summer session, 206; and there were 85 members in the faculty. The income for the year was approximately \$160,000. The library contained 14,000 volumes. During the year a Department for Vocational Training for Rehabilitation Students under direction of the Federal Board was established; also, a Department for Special Training for Detachment of Officers from the Motor Transport Corps. The school was founded in 1888. President, Kenneth Gordon Matheson, LL.D.

GERMAN COLONIES. See WAR OF THE NATIONS.

GERMAN EAST AFRICA. Before the war a German protectorate lying to the south of the British East Africa protectorates and extending from Lakes Victoria Nyanza, Tanganyika and Nyanza to the Indian Ocean. The conquest of the colony by the British troops was completed in 1918 and its final disposition was the subject to the Treaty of Versailles. See WAR OF THE NATIONS.

GERMAN EVANGELICAL SYNOD OF NORTH AMERICA. See EVANGELICAL SYNOD OF NORTH AMERICA.

GERMAN LITERATURE. If the critics of the Allied countries expected German literature after the armistice to strike a note of repentance or even regret for the ignominious part played by Germany in the world war, they must be sorely disappointed. For while the absence of that brazen defiance which characterized the outpourings of German writers during the first two years of the war must be admitted, the general tone is one of self-satisfied consciousness of having showed the world their "might," even if there be at present sorrow and want in many homes of the fatherland. That self-righteousness is so typical of the race that it is likely to prevail. Few and far between are the books that sound a note of warning or exhortation. The much-needed moral renaissance of the new Germany seems to be slow in manifesting itself.

As for the book production as such, it is astonishing that in spite of paper shortage and other economic obstacles it has not perceptibly diminished. However, as a very large number of books bear no date of publication—a detail which German publishers have always meticulously observed—it is safe to presume that the omission of the date is meant to make some books appear as novelties, which have perhaps been on the German market for a year or more.

FICTION. A great number of novels and short stories of recent publication deal with the countries and provinces that occupy a prominent place in the deliberations of those who are reconstructing the map of Europe. Hermann Sudermann, always on the alert which way the wind blows, has capitalized the interest of the reading public in problems of Eastern Europe by writing a volume of *Lithauische Geschichten*, for which there is much demand. Friedrich Lienhard gives us in his *Westmark* a story of Alsace. Fritz Skowronnek's novel, *Das schleichende Gift*, with its sub-title *ein Masurenroman*, is a story of Polish Austria. Otto Soyka, an author who made his debut shortly before the war, has written a novel of Russia, very appropriately entitled *Der entfesselte Mensch*. Nikolaus Bruck's *Ich warte*, is a story of Strass-

burg, Alfred Knoblauch's *Heimat* of East Prussia, Josef Lux's *Das grosse Bauernsterben* of rural Austria, Heinrich Rienow's *Das heilige Erbe* of German Austria, while Mia Munier Wroblowska's *Der graue Baron* is a Lettish story, and Friedrich H. Krave in *Die von Brock*, deals with Baltic types. Other novels dealing more or less directly with problems of the present are *Tochter der Hekuba* by the gifted, though almost too prolific Clara Viebig, *Die Präsidentin* by Agnes Harden, *Weltrausch*, a story of Austria's decline by Rudolf Lothar, Paul Zifferer's *Das Feuerwerk*, Adelheid von Rothenburg's *Die Natherin von Stettin* and Diedrich Speckmann's novels with rural setting *Die Heideklause*, *Heidehof Lohe* and *Der Auerbe*. The productivity of some of the writers of fiction during the stress of war and revolution is truly amazing. Felix Philipp seems to have abandoned drama for fiction and has published two books during the past year: *Hotel Gigantic*, a society story, and *Jugendliebe*, a novel of old Berlin. Fritz Skowronnek, besides the novel mentioned before, has written *Die süsse Not*, *Die Lore auf dem Dach* and other books; Hans von Hoffenthal, *Maria Himmelfahrt* and *Maria Flora*; Olga Wohlbrück *Romantik* and *Der grosse Rachen*; Ida Boy-Fd, the mother of the man who figured prominently in the annals of German intrigue in the United States has two books to her credit: *Die Stimme der Heimat* and *Erschlossene Pforten*; Georg Hermann, perhaps the best interpreter of old Berlin, figures on the title-page of *Heinrich Sohn, Jr.* and *Einem Sommer lang*. Clara Viebig returns in her *Naturgewalten* to the familiar soil of her native Eifel region. Herman Stegemann's *Theresle* suggests the Alsace which made him famous. A number of Austrian writers figure on the title-pages of recent novels, foremost among them Arthur Schnitzler with *Casanova's Heimfahrt*, Hermann Bahr with *Die Rote Korahs*, Karl Hans Strobl with a story of student life in Prague, *Die Vaclavbude*, Rudolf Hans Bartsch with *Heidentum*, the story of a solitary; the veteran Balduin Groller with *Der Leibeigene*, and Stefan Grossman with *Die Partei*. Historical and romantic stories of the genre in which Felix Dahn excelled are represented in Paul Albrecht's *Ein königlicher Zauderer* and *Arminius Sigurfried*. Kurt Münzer has written a story of old Berlin, *Menschen von gestern*, and Alfred Schirokauer a historical novel of Saxony, *August der Starke*. The faithful Boswell of Wilhelm von Hohenzollern during the war, Karl Rosner, is the author of *Die Beichte des Herrn Moritz von Cleren*. Ludwig Goen deals with an interesting legend in *Die Papstin Johanna*. Rudolf Stratz's *König und Kärner*, Hanns von Zobeltitz's *Der Alte auf Topper*, Arthur Zapp's *Die Sünde wider das Weib* and Heinrich Steinitzer's *Das schlesische Fräulein* and *Der Mann der geheht sein wollte* have each an element of popularity, while the name of Gustav Freussen will suffice to secure success to his novel *Die Brüder*. Heinrich Lillienfein, a few years ago considered a promising dramatist, figures on the title-page of the novel *Die feurige Wolke*, Georg Hirschfeld, one of the survivors of the Young Germany of the eighties has written *Die Hände der Thea Signer*, and Rudolf Presber, whose name is associated with lyrics and drama, is the author of *Mein Bruder Benjamin* and *Hans Thomas Al-*

taich, a Bavarian story. Motives of mysticism are struck in Werner Scheff's story of "super-sensual" love, *Die wandernde Seele* and Ferdinand Runkel's *Das rote Brevier*. Stories of the sea are A. Schmid-Brake's *Georg Rath-See-maschinist* and *Peter Storms Traumfahrt*. Joachim Delbrück's suggestive *Ein Spiel in Moll* bears the sub-title *A Chopin story*. The magic word *Freiheit* appears on the title-page of two novels, one by Friedrich Freksa, the other by Hans Wilhelm. Fritz von Ostini's story of the criminal court is entitled *Tat und Schuld*. A number of Swiss writers have made their appearance. Robert Wehrli with *Zur Scholle*, Arthur Neustadt with a story of the Engadin, *Surlej*, and Rudolf Schwarz with *Das Val in Schnitzliken* and *Der Abgott am Münster*. E. von Keyserling, whose society stories have an elegance unusual in German fiction, has written *Feiertagskinder*. Augustus Schmehl, a newcomer, calls his volume of short stories *Die Bekehrung des Abbé* and adds the subtitle *Preziose Geschichten*. Jakob Wassermann, who is by many critics considered Germany's master story-teller figures on the list with a two volume novel *Christian Wahnschaffe*. Of the brothers Thomas and Heinrich Mann, the former remains true to his conventional tendencies in *Die Armen*; while his brother, one of the few German writers who disapproved of the policy of imperial Germany, has followed up his *Professor Unrat* with *Untertan*. Among long-familiar names that recently appeared are Louise Westkirch with *Die vom Rosenhof*, Charlotte Niese with *Damals*, E. von Adler-Ballestien with *Die Ehege im Bernstein*, Gabriele Reuter with *Die Jugend einer Idealistin* and *Die Herrn*, Carry Brachvogel with *Das Glück der Erde* and Marie Eugénie delle Grazie, the veteran Austrian writer, with *Donaukind* and *Das Buch der Liebe*. A newcomer who is much heralded in the press is Richard Knies, author of the peasant story *Die Herlishofer und ihr Pfarrer*. Clara Ratzke's *Die Gasse* and Juliane Krawath's *Eros* also signalize successful debuts.

DRAMA. The theatres of Germany have suffered little during the revolutionary upheavals and radical changes of the past year. According to statistical data concerning first performances for the season ending July, 1919, Berlin has had 25 premières, Frankfurt nine, cities like Munich, Leipzig, Düsseldorf and others an average of four. The Shakespeare *Jahrbuch* states that there were given 177 Shakespeare performances in Berlin alone. Among the new plays none seem to have had a great success. Hermann Sudermann succeeded by his comedy *Das höhere Leben* thoroughly to disgust even fair-minded critics. Max Halbe, whose *Youth* is not unknown in America, figures on the list with a "dramatic legend," called *Schloss Zeitvorbei*. Ernst Hardt, the Schiller prize-winner of a few years ago, brought out a subtly symbolical play *Die Quelle* which he calls "scenic prologue," and the setting whereof is Weimar, Karl Sternheim, who delights in going to the utmost limit of what is permissible on the stage and the printed page and recently had to appear in court, scored a success with his political drama in three acts *Tabula rasa*. Roda-Roda, one of the pillars of the *Simplizissimus* staff, promptly dramatized the Munich revolution in *Der Minister*, while Wilhelm Speyer in presenting his anti-revolutionary comedy, *Der Revolutionar*, found it

necessary specially to mention that it was written in 1917. Karl Schönherr, the Austrian, brought out a revised version of his old play *Das Königreich*, which proved very much more effective than the original. Frank Wedekind, who died towards the end of the foregoing year, figures on the list with *Elms Erweckung*, which he calls a fragment of a drama, and the pastoral play *Felix und Galathea*. Stefan Zweig, the Austrian poet who has become known in America through his book on Verhaeren, does not tire in attempting drama, though his vein is mainly lyrical, his poetic drama is called *Legende des Lebens*. Richard Beer-Hofmann's dramatic prelude *Jacob's Traum*, Max Beer's *Der Erlöser*, Ernst Barlach's *Der arme Vetter*, Emil Sandt's *Die Bräuer*, Victor Georgen's comedy *Der blinde Gott*, Franz Lösser's peasant-drama *Die Herrgottsbrücke*, Jacob Löwenberg's poetic drama *Aelfrid*, Lola Landau's *Uhlau*, and Rudolf Leonhard's tragedy *Die Vorholle*, though not without interesting features, fall short of real dramatic vitality. Considerable discussion was aroused by Franz Kaibel's comedy on the Enoch Arden motive in carnival setting *Frohliche Wiederkehr*, by Hermann Kessner's tragicomedy of a politician, *Summa summarum*, Alfred Nagel's Ibsenian drama *Anne Nielsen's Ruhm*, Maja Lochr's five-act tragedy *Tristans Tod*, Waldfried Burggraf's mystery play *Mammon*, which seems to augur a revival of Christianity, Hans Franck's *Freie Knechte*, which deals with the useless waste of human life in war, Rudolf Lackner's *Der Sturz des Apostels Paulus* with its use of Biblical motives, Otto Borngräber's mystery play of love, *Die andere Nacht*, Georg Kaiser's five-act drama *Gas*, Karl Röttger's one-act pacifist play *Die Krise* and Wilhelm Stiecklen's *Purpus*, noteworthy for its clever character analysis. Ernst Zahn, the Swiss novelist, appeared upon the stage with a drama called *Johannes a pro*. His countryman Emanuel von Bodmann, heretofore known only as a lyric poet, had a *Donatello* produced in Berlin, but neither work is likely to live long. Ferdinand Seebrecht has attempted a curious experiment in *Don Juan und Maria*. Walter Hasenclever, one of the younger dramatists who are being taken rather seriously, followed up his earlier work *Der Retter* with a modernized version of *Antigone*. Oskar Koschka, the Austrian poet-painter, has also once more, though with no more success than before, ventured forth into drama; his two plays are *Der brennende Dornbusch* and *Hiob*. Another Austrian writer, known so far only as author of some distinctive verse, Anton Wildgans, made an ambitious dramatic attempt in the five-act tragedy *Dies irae*. Ernst von Wolzogen, the humorist who some years ago lectured in the United States and on his return published a book on this country, suggestively called *Dollarica*, remains true to his cabaret style in the three-act comedy called *Weibchen*. An indefatigable aspirant for dramatic success is Herbert Eulenberg, who, however, always falls short of real achievement. He appears on the list of the year with a festival play *Die Insel*, a play called dramatic causerie *Die Glücklichen*, a semi-historical drama of the year 1466 dealing with Poles and Germans *Das Ende der Marienburg*, and a five-act tragedy, *Lebenschaft*, which received a prize at the Vienna Volkstheatre. One of the most sensational performances in Berlin was that of Else Lasker-Schueler's weird five-

act drama, *Die Wupper*, which prominent critics called insolently original. A breach of professional tact towards Senor Ibañez is suggested in the title of three one-act plays by an unknown writer, Leo Weissmantel: *Die Reiter der Apokalypse*, recently published in Würzburg.

LYRICS, EPICS, ETC. The volumes of verse published during the year are numerous and cover a wide range of subjects. Christian Morgenstern, a writer who has the rare distinction of shunning publicity and limiting his production, appears on the market after many years of silence; his book is entitled *Stufen* and is announced as an "evolution in aphorisms and diary notes." Richard Schaukal, the Austrian, calls his new book simply *Verse*, as Robert Walser his little volume *Gedichte*. It is curious that German critics so often emphasize the fact, when a book they review is by a Catholic; in this way attention has been called to Hans von Hammerstein's songs, pictures and ballads under the title *Zwischen Traum und Tagen* and to the verse-epics *Aus Herz und Heimat* by Br. Willram. Two Swiss poets appear among the newcomers of the year: Gottfried Bohnenblust with *O mein Vaterland* and Max Geilinger with *Der Weg ins Weite*. A note of local patriotism is struck by Carl Bock in *Alt-Dobern*. Carl Lange figures on the title-page of a volume of verse called *Sturm aus der Tiefe*. A book of political poems by Hermann Haders is entitled *Von deutschen Heiland*. Jacob Kniep's miracles and visions *Vom lebendigen Gott* have a note of fervor and sincerity which made a profound impression. Walter Heymann's last book of verse is called *Fahrt und Flug*. Ernst Lissauer, the famous bard of hatred, has written *Die ewigen Pfingsten*.

ART. The sumptuous volumes by Dr. Hugo Kehr on Rubens, with 80 illustrations and on Zurbaran with 60, as also the book by E. W. Bredt on *Rembrandt's Erzählungen* with 70 illustrations and the no less profusely illustrated volume on the artist Neureuther, called *Bilder um Iacder* bear no date of publication, but seem to be of recent issue. A book by Georg Kutzke, *Voraussetzungen zur künstlerischen Weltmission der Deutschen* bears a title which suggests the undiminished national conceit of the generation.

CRITICISM. The number of critical works is as usual very great. A new enterprise is Horst Stobbe's *Almanach der Bucherstube*, a sort of annual for book lovers and librarians. An interesting subject is treated in Max Scherrer's *Kampf und Krieg im deutschen Drama von Gottsched bis Kleist*. There are books of commentaries and criticism on Kleist, Hölderlin, Jean Paul, who is called prophet of peace and freedom; Wieland, Luther, Kant, Dürer, Fichte, and of course Goethe and Schiller. Shakspeare-literature has also been enriched by some volumes. Of modern writers Gottfried Keller, Rainer Maria Rilke, J. V. Widmann and Frank Wedekind have been the subjects of special volumes. The Swiss critic and historian Adolf Frey has published a book on the poets of his country. Among foreign writers Walt Whitman, Romain Rolland and Henri Barbusse have received much attention.

MEMOIRS. Significant for the attitude and sentiment of the German poet-patriots of the time is the volume by Richard Dehmel, *Kriegstagebuch*, in which he declares himself for the fatherland and the war against all mankind.

Georg Herrmann, the novelist, has published a volume of *Randbemerkungen 1914-17*. Peter Altenberg, the whimsical Austrian, whose death is deplored by many admirers, has left us a volume of recollections, *Mein Lebensabend*. Memories of Peter Rosegger are revived by the appearance of his *Abenddämmerung*. Selections from the note-books of Julius Rodenberg, whose place among the old editors of Berlin has been difficult to fill, are collected in *Aus seinen Tagebüchern*. Among the many volumes of letters, the selection from those of Hans von Bülow is likely to prove of great interest.

HISTORY, GEOGRAPHY, TRAVEL. Numerous books on the countries figuring in the war have been written by German authors. Palestine and Russia have called forth a large number. Among the latter the book on the Russian revolution by Alfons Pacquet, a much-traveled poet and man of the world, is likely to prove of value.

POLITICS. Among the many volumes on the war, those by von Tirpitz, Ludendorff, Helfferich and Bethman-Hollweg are the most widely read. Czernin's *Im Weltkriege* is likely to rival them in popularity. Dr. August Müller's *Sozialismus oder Sozialismus* deals with a timely subject. Dr. Kurt Mühsam's *Wie wir belogen wurden* is founded upon the documentary evidence which has established the mendacity of official Germany beyond any doubt. Significant for the status of Germany's sexual morality is the appearance of such books as Professor Grotjohann's *Die hygienische Forderung* and Grete Meisel Hess's *Das Wesen der Geschlechtlichkeit*, a two-volume work in which she pleads for return to the ideal of monogamy. Of timely importance are Joh. W. Harmich's *Skizzen und Stimmungen aus der Weimarer deutschen Nationalversammlung* and the famous German industrial magnate, Walter Rathenau, has also added to the literature of current topics by three booklets: *Nach der Flut*, *Der Kaiser* and *Der neue Staat*.

NECROLOGY. The year's list of dead is large, though it contains few names counted among the greatest. Foremost among them is Hedwig Dohm, the valiant champion of woman's rights, who some 40 years ago created a sensation in Germany by her feminist works and has since been a power for good among the country's intelligent womanhood. Others are Paul Lindau, the veteran novelist, dramatist and editor, Peter Altenberg, one of the most original of modern German writers, Gustav Landauer, prominent in the generation of the eighties, Leopold Adler, director of the court theatre of Braunschweig, Carl Busse, one of Germany's most popular lyric poets, Hermione von Preuschen, the poet-painter and traveler, Eduard von Tempeltey, a dramatist, Martin Bielitz, a lyric poet, Dr. Paul Deussen of the university of Kiel, an authority on Schopenhauer and the philosophy of India, Dr. Max Georg Zimmermann, lecturer on art history at Bonn, August Trinius, a writer of and on Thuringia, and others.

GERMAN NEW GUINEA. A former possession of Germany, constituting a protectorate comprising the northern section of the southeastern part of the island of New Guinea, along with the Bismarck Archipelago and the German Solomon Islands. The Caroline and Mariana islands were dependencies. The protectorate was occupied by the Australians on Sept. 12, 1914. See **WAR OF THE NATIONS**.

GERMAN PROTECTORATES. The dominions of Germany over-seas were attacked by the Allies at the beginning of the war and their conquest was almost complete by the close of 1917 and was entirely completed in 1918. They comprised in Africa the colonies of East Africa, Kamerun, Togo, and Southwest Africa; in the Pacific New Guinea (with the Caroline and Mariana islands), Palau, German Samoa and the Marshall islands, and in the Far East Kiaochow. Total area, 1,140,117 square miles; total population, 13,258,000. Their ultimate destination was subject to the Peace Conference. See article **WAR OF THE NATIONS**.

GERMAN SAMOA. A former German protectorate comprising that portion of the Samoan group which lies to the west of longitude 171° east; area, about 994 square miles, and population, about 40,000. They were occupied by the New Zealand force Aug. 29, 1914, and their ultimate destination was subject to the Peace Conference. See article **WAR OF THE NATIONS**.

GERMAN SOUTHWEST AFRICA. A former protectorate of Germany lying between Angola and the Cape Province of the union of South Africa. For statistical details see preceding **YEAR BOOKS**. Its status was subject to the Peace Conference. See **WAR OF THE NATIONS**.

GERMANY. Before the revolution of 1918 the German empire was a constitutional monarchy, consisting of 25 federated states and an imperial territory (Reichsland), situated in central Europe. In the closing months of 1918 it was under a provisional republican government, and in 1919 it was definitely constituted a republic by the constitution, which went into effect in August.

AREA AND POPULATION. The 25 states of the German Republic have an approximate area of 540,857.5 square kilometers, exclusive of the German part of Lake Constance, and the North Sea Lagoons. This is a little larger than the area of continental France, and, when expressed in square miles, is 208,825.2 square miles. The population was estimated a month before the war, June 30, 1914, at 67,812,000. Because of the recent unsettled conditions in Germany, there are no statistics available for details of population later than those given in the preceding **YEAR BOOKS**, which are based on the census of 1910. The increase in population in 1910 of the countries which now compose the German Republic, was 1.3 per cent. For details as to population, density, births, marriages, deaths, religious distribution, emigration and immigration, etc., the reader is referred to the issues preceding the 1918 **YEAR BOOK**. To facilitate reference, a summary of the figures is repeated below, showing the population by states according to the 1910 census, together with the area, political status being indicated in the former Empire by the letters following the names, *K.*, Kingdom; *G.D.*, Grand Duchy; *D.*, Duchy; *P.*, Principality; *F.C.*, Free City; *R.*, Reichsland.

States	Sq. m.	Pop. 1900	Pop. 1910

EDUCATION. Education is general and compulsory throughout Germany. Prussian laws require the establishment of elementary schools in every town. The school age is from six to 14. From the school census of 1911, we find that there were 61,557 schools, with a total of 148,217 male teachers, and 39,268 female teachers, and a total attendance of 10,309,949. The following table gives the statistics for the summer half-year of 1918 for the technical high schools, which have the power of granting degrees and number 11.

Schools	Teaching staff	Students
Berlin ..	176	429
Munich ..	74	410
Darmstadt ..	88	174
Karlsruhe ..	91	162
Hanover ..	80	152
Dresden ..	73	273

Aachen ..	84	253
Brunswick ..	55	75
Danzig ..	57	123
Breslau ..	42	66
Totals ..	901	2,231
Total for 1917 ..		1,721
Normal peace times ..		12,000

There are various schools and universities for agriculture, veterinary high schools, schools of mining, architecture, building, forestry, art-industry, commercial schools, textile schools, special metal schools, for wood-working, for ceramic industries, for naval architecture and engineering, for ship's engineers, for navigation, and for music. There is a naval academy and school at Kiel, with military academies at Berlin and Munich, not including the 47 schools of navigation, 9 military schools, and 9 cadet institutions. There are 22 universities in the German Republic, with a total enrollment early in 1918, of 64,842 students, but the number in residence was only 11,500 men and 5259 women.

PRODUCTION. Following figures for agriculture give the areas under the principal crops, in acres:

	1916	1917	1918
Wheat ..	3,996,820	3,615,182	3,588,395
Rye ..	14,910,302	13,810,050	14,366,302
Barley (summer) ..	3,721,685	3,568,872	3,412,857
Oats ..	8,861,428	8,726,507	8,165,280
Potatoes ..	6,861,625	6,258,877	6,818,860
Beets ..	1,029,890	1,031,155	1,004,265

The total yield in metric tons, according to the *Statesman's Year Book* for 1919, was:

	1916	1917	1918
Wheat ..	2,999,385	2,126,005	2,458,418
Rye ..	8,902,843	6,977,191	8,009,090
Barley ..	2,745,088	1,821,238	2,064,588
Oats ..	6,928,293	3,628,253	4,680,755
Potatoes ..	24,691,170	34,410,982	29,469,718
Beets ..	10,137,975	9,987,321	9,883,800

The crop conditions in the fall of 1919 did not measure up to the expectations, and were less satisfactory than plans had indicated. Scientific methods and state administration characterize the German forestry industry, which is of great importance. In 1919, of the forest area, one-third (11,225,660 acres), was under foliage trees, birch, ash, oak, and beech, etc., and two-thirds (23,344,240 acres), have pine, white fir, red fir, larch, etc. In normal peace times the yards of timber produced was in the vicinity of 26,000,000 cubic yards, and of firewood, over 23,000,000 cubic yards.

MINERALS. Prussia contains the chief mining centres, Westphalia, Rhenish Prussia, Silesia, with coal and iron, Harz with silver and copper, and Silesia with zinc. The new potash law went into effect in Germany on Apr. 24, 1919, designed to socialize the potash industry by giving the workers a larger share in its working and profits, and by unifying its interests under government control. It was expected in the reorganization that the executive regulations, when completed, would provide for four bureaus, an examining bureau, a bureau for appeals, a wage-examination bureau, and a technical agricultural bureau. The examining bureau was to have supervision of matter of current business, including the fixing of percentages of participation by the various mines in current sales, and decisions relative to the interests of employees. The bureau of appeals was to settle disputes arising between mine owners concerning the allotment of shares of participation in potash sales. Strong representation for the employees was a feature of the wage-examination bureau, whose function would be the settlement of wage disputes. The functions of the technical agricultural bureau were to consist largely of domestic propaganda and advertising with a view to promoting and increasing the use of potash in Germany. This bureau was to operate only in the domestic field, leaving the potash syndicate free, as before, to choose its own methods of foreign advertising. In 1917, German agriculture consumed about 87 per cent of the output of the mines, whereas, in 1913, 55 per cent was so used, the balance having been exported. Investigations indicated a total stock of refined salts at all mines of 25,000 to 35,000 tons, which, in comparison with the normal output, must be regarded as quite small. In November, 1919, official German statements indicated that because of the reduction in the standing army, and also in the manufacture of munitions and equipment, it was believed that as many men would be released from these activities to engage in useful or productive occupations, as had been lost in the war. If there should be no mistake in this estimate, then it was possible for Germany to begin at an early date to experience a great industrial and commercial awakening. Coal production seemed to offer a difficulty in labor organization, and it was diffi-

cult to interest operators of coal mines in starting up their mines until it was fully determined just how France was to be supplied with the coal demanded by the peace terms. The output of potash in 1918 was 10,019,000,000 cwt., as against 10,942,000,000 cwt. in 1917.

COMMERCE. Since 1879 Germany has pursued the protectionist policy in her commercial relations. Nearly one-half the imports are subject to duty, the duties levied amounting in 1919 to over 20 per cent of the value of imports subject to duty. German newspapers indicated that the German manufacturers of agricultural machinery had recently been receiving large orders from neutral countries. Exports of agricultural machinery to Poland had become very extensive. The factories, however, were unable to fill more than 50 per cent of the orders on account of their diminished productivity. There was a movement on foot to organize German automobile manufactures into what appeared to be a cartel, similar in form to the German dye-syndicate. Generally speaking, there was no great optimism among German merchants and manufacturers with regard to the question of foreign trade after the ratification of the peace treaty by the United States. It was considered that the trans-oceanic trade would play only a secondary part beside the exchange of goods over land borders. Only the outline of a continental economic system was in sight, under which Germany would be mainly relegated to the unsafe and difficult east-European markets. Dr. C. Schneider, chief of the economic department of the German Foreign Office, expressed himself with regard to the above situation to the effect that without a commercial fleet, and without colonies, with German property abroad liquidated, and German branch offices closed, and without any settled exchange facilities, Germany had no chance whatsoever of carrying on trans-oceanic trade on her own account. With regard to Germany's most important industry, iron and steel, which has been the basis of such a large part of Germany's exports, Dr. Schneider thought it would undergo a very radical change, which would influence even Sweden, as an iron-exporting country.

In connection with the resumption of British trade with Germany, details were furnished by the president of the board of trade, showing that during the first 10½ months from the signing of the armistice, the United Kingdom exported to Germany goods to the value of over \$80,000,000, and received from Germany imports valued at \$1,087,000. (See GREAT BRITAIN.) The following information was supplied at the close of the year by the United States Bureau of Foreign and Domestic Commerce, based on reports of the Trade Commissioner in London, and on figures prepared by the Division of Statistics:

There were, toward the close of the year certain advantages on the side of German exporters, such as the low purchasing power of the mark, which meant that all costs in Germany itself were small compared with costs in England where the mark was reckoned at 100 to a pound sterling. When bituminous coal was quoted at 76.43 to 80.6 marks a ton, and coke at 112.75 to 123.75 marks, the real cost to a manufacturer corresponded with a price in England at 15s. to 16s. a ton for coal, and 22s. to 25s. for coke. English delivered prices were almost double.

Railway rates, wages, and iron ore were all high in marks and low in real values, even after the recent additions, such as the 50 per cent added to railway rates on October 1st. All over the continent there was a keen demand for goods, and, according to the Rhenish-Westphalia correspondent of the *Frankfurter*, "encouraged by the low exchange, neutral countries were pouring in orders. The German fear that foreign agitation would do us harm has not been justified; indeed, Britain was one of the first enemy States to import large quantities of steel goods from Solingen." The United States, too, according to the same journal, had sent agents to buy up all they could.

Combines, trusts, or kartells had been great engines for pushing German trade before the war, and were getting to work again. The Stahlwerksverband was renewed until March 1st, after having been unnecessary during the war, with its insatiable demand for iron and steel. The Machine Tool Association created a new organization, and the electric-lamp factories of the Auer Gesellschaft were combined with those of the Allgemeine Elektrizitäts. Various firms in the motor trade combined to meet the competition of American machines and new combinations were starting in other trades. Then a great "National Union for German Industry" was formed to embrace all branches of production, both raw material and finishing, thereby uniting two old enemies, the manufacturer and the big concerns who used to supply him with fuel and raw materials. Some remarkable evidence of a real revival was to be found in the German National Fair at Leipzig. Most of the 10,500 firms exhibiting were German, and the attendance reached the record figure of 118,000, or about 20 per cent more than in any previous year. About seven thousand foreign buyers are said to have been present. With the idea of getting into foreign markets again, German manufacturers concentrated on mechanical devices and novelties, machine tools, and electrical inventions. In these products it is mechanical precision which counts, while the raw material and coal used bears a small percentage to the value of the finished article.

On the other hand, German exports were severely hampered by the lack of certain raw materials and the shortage of coal. Things made of wood, such as toys, could be turned out easily enough, but even here it was stated on all sides that the factories were at a standstill. Dolls, for instance, were poorly clothed and made of cheap material. Labor, too, according to the *Journal of Commerce*, was paid two or three times as much as before the war, in marks, and does about two-thirds as much work. Lack of food and the high percentage of war cripples contributed to the drop in output per man.

Record-breaking exports to Germany of American pork, beef, and other meat and dairy products, produced in response to war-time appeals, were made during October and November of the past year, in addition to the extraordinary quantities supplied to Belgium and other allied countries before and since the armistice. These products, with cotton and leaf tobacco, constitute the bulk of the United States exports to Germany for the five months ending November, 1919. Imports for the same period showed monthly increases from \$291,166 in July to \$3,-

228,919 in November. These imported German goods consisted chiefly of chemicals, fertilizers, furs, sugar-beet seed, unengraved lithographic stones, beads and bead ornaments, china and crockery ware, glass bottles, sheet and plate glass, cutlery, needles, leather gloves, musical instruments, imitation precious stones, artificial silk yarns and threads, and dolls and other toys.

Monthly imports from and exports to Germany for August to November and the total for the 11 months ending November, 1919, as compared with the corresponding periods of the pre-war year 1913, were:

Mo	Imports		Exports	
	1913	1919	1913	1919
Aug.	\$15,626,176	\$236,293	\$21,301,274	\$11,674,257
Sept	18,809,555	1,586,963	34,789,624	8,836,693
Oct	14,815,675	2,157,608	48,433,396	20,663,521
Nov	14,256,993	3,328,919	48,072,784	23,044,142

Nov.	165,939,267	8,143,706	318,720,256	75,464,237

Taking into consideration the difference between post-war and pre-war values, these imports from Germany seemed insignificant as compared with the pre-war trade. In view, however, of Germany's exhausted condition since the war, the urgent need of foodstuffs, and the depreciated value of the mark, the gain shown in the import figures from month to month was notable. The growth seemed to indicate that a continuous effort was being made to re-establish this foreign trade.

LIVING CONDITIONS. All items of cost were greatly increased over pre-war costs—labor, about three times, coal much higher, and many other supplies and requirements ran as much as 10 times pre-war costs. It was stated that food was plentiful in Hamburg and cheaper than in the United States. At the best hotels and restaurants, one could secure excellent meals. Steaks, veal chops, etc., were served upon request, although they did not appear on the menus. Meat was scarce, much of it being obtained in a roundabout way, and contrary to law. Food for the masses was scarce. The following ration list shows the government's per capita allowance for a week ending Nov. 15, 1919: Bread, $4\frac{1}{2}$ lbs.; American rye flour, $\frac{1}{2}$ lb.; potatoes, 7 lbs.; butter, $\frac{1}{10}$ lb.; margarine, $\frac{1}{5}$ lb.; milk and eggs, only for children or sick adults (limited quantities); domestic sugar, $\frac{1}{3}$ lb.; imported sugar, $\frac{1}{2}$ lb.; sirup, $\frac{1}{4}$ lb.; corned beef, $\frac{1}{8}$ lb.; sausage $\frac{1}{10}$ lb.; horse-meat, canned, 2 lbs.; lard and dry salt meats, none. In the matter of wearing apparel, conditions were about the same. A tailor-made suit cost from 1500 to 1800 marks, against a normal price of 150 marks. Men's hats, formerly costing from 10 to 15 marks, sold at 150 marks. Other articles were in proportion. Woolen underwear, except for inferior grades, was impossible to secure. The German people fully realized the burden they imposed upon themselves, and to many the situation appeared serious and almost hopeless. Others took a brighter view, and felt confident that the return to normal would be with a speed that would surprise the world. Notwithstanding the depression, there was hardly a store or office for rent, and it was almost impossible to secure living quarters. Luxuries appeared to be freely purchased.

X-B—19—10

RAILWAYS. The total railway mileage, Jan. 1, 1917, was 40,255, of which all but 2926 belonged to the state systems. The *Berliner Boersen Zeitung*, of Sept. 16, 1919, stated that a bill had been introduced into the Prussian legislature, authorizing the Prussian-Hessian State Railways to increase their freight rates by as much as 50 per cent, commencing Oct. 1, 1919. On Apr. 1, 1919 the passenger rates were increased generally, in some cases doubled, and the freight rates were generally increased by 60 per cent. From October first a new increase in passenger fares went into effect for travel on ordinary trains. Supplementary to these new rates, additional fares will be charged on express trains according to a zoning system. Destinations within 50 miles of the starting point are in the first zone, those within 100 miles in the second zone, and everything beyond this distance is in the third zone. The supplementary fare for the third zone was nine marks for first-class accommodations. The estimated receipts for 1919 were 4,800,000,000 marks. From the present prospects it appeared that the actual income would only amount to about 3,760,000,000 marks, unless increases were allowed. The 1919 expenditures were originally estimated at 4,860,000,000 marks, but later estimates indicated a strong possibility that they would amount to about 7,200,000,000 marks. (The normal exchange value of the mark is \$.238.)

Labor difficulties and shortage and deficiencies of equipment rendered railway operation in Germany during 1919 very unsatisfactory. At the end of the year it was estimated that the deficit on the Prussian railways amounted to 634,000,000 marks (nominally \$158,500,000), of which 160,000,000 marks (\$40,000,000) went to cover indemnities for railway thefts. The total working expenses for the year were estimated to amount to 7,500,000,000 marks (nominally \$1,875,000,000).

The Prussian State Railways were seeking to increase their locomotives and in August 223 were delivered from the works, in September 137, and in October, 96. At the end of the year over 2000 were on order. It was also announced that the German government had given the Krupp Works a contract for the manufacture and delivery of 100 locomotives and 2000 15-ton freight cars per year. In connection with this contract it was reported that the price to be paid would be based upon the actual cost of the material used and of the labor, and that the manufacturers themselves would only be allowed a commission profit of 2 per cent. Directly after the armistice, Krupps converted two of the munition factories into rolling stock factories, and these two factories were said to have a total capacity of 300 heavy locomotives and 2500 15-ton freight cars per year or approximately one locomotive and 10 cars daily.

In fact at the end of the year the last and greatest of the "Hindenburg" buildings, covering an area of 18 acres was devoted to the erection of locomotives and the first of these was delivered early in December.

SHIPPING. The shipping during the year of 1919 had not recovered perceptibly from the practical stagnation that it was left in at the close of the war. The coast trade had opened up, but so far trans-oceanic service by German companies had been impossible to any great extent.

FINANCE. Budget estimates, omitting expenditures for the army and navy, that were to come out of special war credits, balanced for the year ending Mar. 31, 1919, at 6,546,699,278 marks. The provisional budget for 1919-20 balanced at about 13,000,000,000 marks. The total funded debt on Oct. 1, 1917 amounted to 85,071,712,700 marks, of which 51,044,200 marks bear interest at 5 per cent, 1,129,817,300 marks at 4 per cent, 1,971,027,800 marks at 3½ per cent, 1,630,988,300 marks at 3 per cent, with treasury bills amounting to 2,158,730,700 at 5 per cent, 4,038,979,900 at 4½ per cent, and 80,000,000 marks at 4 per cent. There was also a debt of 23,017,629,500 marks of treasury bills free of interest. At the beginning of 1918, the total loan credits of the imperial government amounted to 98,841,493,791 marks. At the beginning of 1919 the German war debt was officially given at 157,700,000,000 marks, the interest on which sum would require 7,900,000,000 marks. The following table from the *Statesman's Year Book* of 1919 exhibits the estimates of revenue and expenditure in pounds sterling for five years ending Mar. 31, 1919, at the exchange rate of 20 marks to one pound:

Year ending March 31	Ordinary	Revenue Extraordinary	Total
1915	170,258,920	519,637,650	689,896,570
1916	166,154,070	502,117,100	668,271,170
1917	182,963,096	4,375,892	187,338,988
1918	247,093,803	4,296,461	251,390,264
1919	366,634,965	5,403,416	372,038,381

Year ending March 31	Ordinary	Expenditures Extraordinary	Total
1915	170,258,920	519,637,650	689,896,570
1916	166,154,070	502,117,100	668,271,170
1917	182,963,096	1,204,960,676	1,387,923,772
1918	217,093,803	1,504,660,249	1,751,754,052
1919	366,634,965	21,303,416	387,938,381

The following report was published by the United States Bureau of Foreign and Domestic Commerce in regard to the financial situation in the closing months of the year:

Finance Minister Erzberger submitted to the German National Assembly in September a memorandum upon which he was understood to have based the taxation plans which the German Legislature had been discussing for several months. In this memorandum the fiscal expenditures were summed up as follows:

	Marks
Total expenditures of German government	17,500,000,000
Total expenditures of Federal States and municipalities	6,500,000,000
Grand total	24,000,000,000

The governmental total of 17,500,000,000 marks was made up as follows: Service of debts, 10,000,000,000 marks; pensions, etc., 4,300,000,000 marks; administration, 1,700,000,000 marks; other current expenses, 1,500,000,000 marks. The total governmental budget in 1913 amounted to 2,430,000,000 marks, and included 230,000,000 marks for "service of debts," 200,000,000 for administration, and 1,500,000,000 for other current expenses. Of the total requirements of the government about 7,000,000,000 marks were provided for by taxes already in operation, as follows: Current tax receipts before the war, 1,767,000,000 marks; increase in

taxes by laws during the war, 4,036,000,000 marks; increase in taxes by laws just passed, 1,150,000,000 marks. In the last-named sum are included the items shown in the following table:

Taxes	Total income Marks	National govern- ment's share Marks	Increase for govern- ment over previous taxes Marks
Inheritance tax	700,000,000	560,000,000	435,000,000
Tax on transfer of land	226,000,000	114,000,000	74,000,000
Sugar tax	340,000,000	340,000,000	130,000,000
Tobacco tax	750,000,000	750,000,000	450,000,000
Playing-card tax	60,000,000	30,000,000	30,000,000
Match tax	50,000,000	50,000,000	23,000,000
Tax on luxuries	13,000,000	10,500,000	8,500,000

With reference to the 10,000,000,000 marks not provided for above, it was expected that at least 3,000,000,000 marks would be raised by the proposed tax on sales and between 2,500,000,000 and 3,000,000,000 marks by the proposed property tax; which would leave a deficit of only 4,000,000,000 or 4,500,000,000 marks. It was expected that a heavy national income tax would be proposed to cover national deficits and also local deficits (ie. of the Federal States and municipalities). The Minister of Finance stated that this tax would probably amount to about 50 per cent of all incomes.

Georg Bernhard, writing for the *Vossische Zeitung*, criticized Minister Erzberger's figures as follows:

"The annual requirements, including obligations arising from war loans, amount to 18,500,000,000 marks instead of 17,500,000,000 marks. This estimate does not include the as yet undetermined obligations arising from the Peace Treaty. At least 7,500,000,000 marks per annum should be allowed for this item. This brings the total annual requirements of the government up to 26 milliards instead of 17½ milliards. Apparently Finance Minister Erzberger has not given due attention to the decrease in receipts occasioned by the loss of German territory. With the corrections just mentioned, the amount as yet unprovided for is thus 18,500,000,000 marks instead of 10,000,000,000 marks."

Minister Erzberger stated that the estimated annual income from the National property tax or "National Emergency Sacrifice" was between 2½ and 3 milliard. By some these figures were believed to be much too high; the tax evaluation of private property in Germany was estimated before the war at between 150 and 200 milliard.

The National Assembly Committee of Ten, during the last week of September, was actively engaged in discussing those German taxation proposals which had not yet been definitely approved.

It was reported in the latter part of 1919 that preparations were being made for the establishment of several French banks. According to a report in the Amsterdam *Algemeen Handelsblad*, a considerable number of American banking and financial representatives were in Berlin establishing connections for future business. Finance Minister Erzberger stated in November, before the German National Assembly, that there were known to be 50 counterfeit imitations of the Reichsbank 50-mark notes in circulation. By Sept. 10, 1919 all these notes were withdrawn and ceased to be legal tender, exchangeable only at the Reichsbank. The establishment of a company for the furnishing of foreign exchange was announced from Berlin in

early 1920. The share capital, which is 300,000 marks (\$71,400 at par) was said to have been entirely furnished by the Ministry for Economics. The sale of requisitioned foreign bonds had not been completed. From a speech by Herr Haverstein, President of the Reichsbank, the following information as to the scarcity of circulating media in Germany is supplied. The total circulation of paper currency in bank notes and treasury notes from September 24th to Oct. 23, 1918, increased by 2,651,700,000 marks (\$631,104,600 normal value) as against 734,000,000 marks (\$174,692,000) in the corresponding period of the year previous. As early as July 1st, the Reichsbank had been obliged to add to the instruments of payment for purposes of both supply and demand, the round sum of 4,000,000,000 marks, (\$952,000,000 at par) which far surpassed the amount of all preceding quarters. For the purpose of preparing immediately and uniformly over the whole country a large quantity of new means of payment, the coupons of the 5 per cent war loan which fell due Jan. 2, 1919, were declared by decree of the Bundesrath to be legal means of payment up to the due date, when they, as heretofore, would be exchanged for other legal currency. By these means and several other emergency measures, the lack of instruments of payment was expected to be met.

DEFENSE. In 1919 the Landwehr and Landsturm were disbanded, and 150 field divisions of the army on the western front demobilized. Of the 20 divisions retained, over 2,000,000 were kept in arms. The old army corps centres have generally been reestablished. Voluntary enlistments had replaced demobilized units to the strength of 250,000 under arms, and 50,000 home guards, as established, until May 1, 1920. Estimates toward the latter part of 1919 indicated that a force of 1,400,000 men could be quickly mobilized. Indefinite plans as to the future generally characterize the Reichswehr, or new army, as it is called. A bill before the National Assembly in 1919 called for the creation of a national militia on the Swiss model.

The republican navy is not in the nature of an effective sea-fighting organization, but rather a coast defense police force. Pre-dreadnought battleships have become obsolete, and most of the guns have been removed from them. The first class of dreadnoughts were dismantled before the armistice, and the next class are in German ports, out of commission. All subsequent classes surrendered at Scapa Flow. The battle-cruiser *MacLensen* was under construction. A bill before the National Assembly in May, 1919, provided for the establishment of a volunteer and democratic navy for coast defense, removal of mines, and policing and protection of the fisheries.

GOVERNMENT. The reigning princes of the Federal States were deposed or abdicated when the Council of the People's Commissioners in Berlin assumed the government of the country. On Nov. 9, 1918, the abdication of the German Emperor was announced, and from that date, Germany became a republic. Arrangements for summoning a National Assembly were made, and the Imperial Parliament was declared dissolved. The elections for this body were held in January, 1919. The actual votes cast for the largest parties were: Majority Socialists, 11,112,450; Democrats, 5,552,930; Centre, 5,338,804; Con-

servatives, 2,729,186; Independent Socialists, 2,186,305, and the German People's party, 1,106,408. The meeting of the National Assembly on February 6th and Feb. 11, 1919, elected the first president of the Republic, Friedrich Ebert, who was in power at the beginning of 1920. On Feb. 13, 1919, the following cabinet was appointed: Prime Minister, Philipp Scheidemann; Minister of Finance and Vice-President of the Cabinet, Bernard Dernburg; Minister for Foreign Affairs, Count von Brockdorff-Rantzau; Minister for Home Affairs, Dr. Hugo Preuss; Minister of Labor, Gustav Bauer; Minister of Reconstruction, Herr Wissel; Minister for Food Supplies, Robert Schmidt; Minister for the Colonies, Dr. Bell; Minister of Justice, Herr Landsberg; Minister of Defense, Herr Gustav Noske; Minister of Posts, Herr Giesberts.

The New Constitution. The new constitution went into effect during the third week in August. It was divided into two principal parts: First, composition of the empire, and second, fundamental rights and duties of Germans. The first part consisted of seven sections of which the main parts were as follows: The German empire was declared a republic whose sovereignty was based on the people. Its territorial limits were defined and the national colors were announced as black, red, and gold. The rights of the empire in relation to foreign affairs and national defense were set forth. Each state was to have a liberal constitution and a parliament elected by universal, equal, and secret suffrage by all Germans, including women. The Reichstag which was to replace the temporary National Assembly was to be elected for four years. The president was to be elected for seven years by the entire people and not by the Assembly, and he was to conclude treaties and receive ambassadors, etc., but declarations of war and peace were to be proclaimed by the Reichstag, and treaties with foreign states were to be ratified by it. The chancellor's position was to correspond to that of a vice-president and he and the ministry were to be nominated by the president. The chancellor was to direct the foreign politics of the government and to be responsible for the cabinet; and the Reichstag was to have power to impeach the president, the chancellor, and the ministers. The imperial council should be composed of the representatives of the states, each of which should have at least one vote and the votes of the large states were to be proportionate to the population of each. The laws were to be submitted to a plebiscite if the president desired. Judges of the ordinary civil courts were to be nominated for life. Court-martials were abolished except in time of war and on board warships. The second part of the constitution relating to the rights and duties of Germans provided that all Germans should be equal before the law and that women should have the same rights and duties as men. Titles of nobility were to be considered simply as names and not to confer any rights or privileges. Marriage was declared to be the basis of the family life and the state undertook to watch with particular care over families having several children. Then followed a long list of the rights including the rights of assembly, etc., to which citizens were entitled. As to education, it was provided that all children should attend school for eight years and afterwards follow courses

in the higher schools to the age of 18; instruction was to be free and the state was to aid families and pupils who were without adequate means; every effort was to be made in the schools to inculcate a spirit of reconciliation with the other peoples of the world. Finally, an industrial council was established in which employees should have an advisory voice.

EVENTS OF JANUARY: ELECTIONS TO THE ASSEMBLY. At the close of the year 1918 the Radicals and Independents were overthrown at a joint meeting of the People's Commissioners and the Central Council, and thereupon the Majority Socialists including Noske came into power. Attempts to drive the Majority Socialists from power and prevent the holding of elections for the National Assembly continued during the early days of 1919, and the fear that the extreme element namely the Spartacides would effect a revolution continued. The year opened with serious disorders in Berlin, Munich, and other cities of Germany that threatened to bring the country into a state of chaos. On January 6th, Spartacides were reported to be marching against the government forces. Occasional rifle shots were fired and a few persons were wounded in Berlin. The government was reported to be ready to take strong measures. On January 3d similar outbreaks were reported at Munich. The demands of the revolutionaries in Berlin were presented in resolutions passed by the Soviet Congress in that city which were reported as follows: Immediate disarming of officers; removal of all marks of distinction between ranks; transfer of local command to workers' and soldiers' councils; election of officers by men; disbanding of the army, disarming of reactionary bodies, and the creation of the peoples' army; prompt action against the war ministry and supreme army command for its disregard of the resolutions of the Soviet Congress. At this time in Berlin it was estimated from fragmentary reports that about 20 had been killed and wounded. It was also said, however, that the supporters of Liebknecht seemed to avoid conflict with government troops. The forces of order were obviously in the majority, but it was doubtful whether they were well organized. The partisans of Liebknecht, though realizing that they were in a minority, apparently hoped by virtue of their organization to prevent the calling of the National Assembly. When the Soviet Congress opposed this by a large majority, they seemed to have decided to resort to violence. The police president, Eichhorn, who supported their views, was discharged and this was taken as an occasion for the uprising. One of their first acts was to seize the Wolff telegraph agency, and the news was therefore uncertain. The revolt had been long foretold. Bolshevism had for many months been penetrating the country, and Russian emissaries had been at work. Further fighting was reported in Berlin on January 14th, when it was said that the independent Socialists had proposed to come to an agreement with the government. At that time Herr Noske was appointed governor of the city. He proclaimed a state of siege and called the marines from Kiel. The government had also concentrated troops to combat terrorism. Fighting was going on, but in a desultory fashion, and to the disadvantage of the Spartacides who were reported to have lost a considerable number of

men. On January 13th, the government of Berlin was said to have things well in hand. The Spartacide movement, however, though thwarted in Berlin, seemed to be making headway in other parts of the country, especially in Rhenish Westphalia, where Dusseldorf was in the hands of the insurgents. Spartacide successes were also reported at Dresden, Bremen, and Stettin. On January 14th, the government forces succeeded in capturing the newspaper quarter of the Spartacides. According to the report of the German government on January 15th, the Spartacide movement had been finally suppressed. The casualties among them were reported as follows: Twelve killed; more than 30 wounded, and 450 taken prisoners. On the night of January 15th Karl Liebknecht and Rosa Luxemburg (q.q.v.) were killed in Berlin. According to the reports they had been arrested during the day and taken to a hotel. Crowds gathered and attacked the prisoners as they were on their way to prison. Liebknecht was shot by his escort while attempting to escape, and Rosa Luxemburg was killed by the mob. Later reports threw some doubt upon the question of Liebknecht's death as an examination of the body seemed to indicate that he had been shot in front. Reports were circulated that both were murdered by the soldiers.

Their death seemed for a time to have the effect of putting an end to the more serious disturbances. Elections for the National Assembly based on equal and universal franchise, were held January 19th and for the most part peaceably. The returns were as follows: Majority Socialists, 166 (89 in the last Reichstag); Christian People's party, that is the reorganized Centre or Clerical party, 93 (91 in 1917); Democratic party, combining the former Progressives and the National Liberals, 75; German National or Monarchist party, a combination of Conservatives and Pan-Germans, 34; Minority Socialists, 24; various minor parties, 11. It is to be noted that the Conservative party which had 45 seats in 1917 and the Pan-German which had 26 in that year both together were represented in the Assembly by only 34; and that the Progressives which had 46 in 1917 and the National Liberal which had 44 were reported together at only 75. The Minority Socialists who had 19 seats in 1917 had made a gain of seven. There were 34 women among the delegates. Weimar was chosen as the place for holding the Assembly greatly to the disgust of a strong element, mainly among reactionaries of Prussia. Dr. Eduard David was elected president of the Assembly and a Democrat and Conservative were elected vice-presidents.

ECONOMIC CONDITIONS. Early in the year the German department of agriculture gave a gloomy account of the prospects. The next crop promised badly, not more than half of the normal harvest being expected. This was due largely to the impoverishment of the soil. Only 80,000 tons of nitrates were available to meet the usual consumption which was 210,000 tons in time of peace, and the consumption of phosphates was only about a third of the usual quantity. The slaughter of domestic and other animals greatly reduced the supply of fertilizers. According to present prospects, a return to normal conditions was not to be expected before 1921. The national ministry of economic demobilization estimated the number

of men out of work in Germany in February as about 1,000,000. Moreover, the war had lessened to an incalculable degree the energy of the workmen, and their demand for employment. In Upper Silesia there had been a great increase in the cost of extracting coal, which added much to the cost of living. Everywhere there were strikes and bankruptcies. The demand of the workmen for an increase of wages added greatly to the economic difficulties. All through the year there were reports as to the serious distress in all branches of the economic life, but these on the other hand were frequently denied and attributed to the German exaggeration with a view to reducing the demands of her enemies. These reports began to come in at the beginning of the year, and continued down to its close. One of the first of them was based on observations by British officers who had visited Germany in January and February to carry on investigations in Berlin and other large centres. According to them unrest was diminishing on account of more suitable political conditions, and the firm stand of the government against the Spartacides, but unemployment and cost of living were increasing. It was estimated in Berlin that the number of unemployed at that time was over 200,000; in Hamburg, 72,000; in Munich, 32,000; and in Leipzig, 22,000. The rapid demobilization of the army and war industries accounted for this in part. Other reasons were: Hesitation of capitalists to undertake new ventures; high prices and high wages; lack of the will to work on the part of the working class, partly on account of the war, and partly on account of insufficient food which caused a lack of energy. In the coal fields conditions were reported to be stagnant. The Silesian and Saar Valley supplies had been cut off by the terms of the armistice, but coal was still raised in Westphalia. Railway transport had been crippled largely on account of the surrender of the great part of the stock under the terms of the armistice. It was reported that in the Hanover railway district, for example, the number of locomotives which in peace time was 1800 had fallen to 850, and that of these a large part were worn out. Staple articles of food were reported to be scarce with the result that the mass of the people were living upon insufficient rations. This caused great mortality among children and lowered the birth rate. Calculations as to the duration of present food stocks were uncertain, but in general the indications were unfavorable. The conclusion of the report was that Germany was in urgent need of revictualing; that the country was living on its capital as regards food supplies; and that it was threatened with either famine or Bolshevism.

DIFFICULTIES OF THE GOVERNMENT. In the first week in February fighting was reported at the chief German naval port on the North Sea, Wilhelmshaven, where the Spartacides made an attempt to seize the power. There was a bombardment of the port from the sea and there were conflicts in the streets. Meanwhile in Berlin conferences were taking place between the Majority Socialists and the German Democratic party with a view to forming a coalition before the meeting of the National Assembly at Weimar on February 6th. In the final returns the Majority Socialists failed to obtain command of the Prussian Diet although a combination between them and the Democrats in both Houses would

give a working majority. On the eve of the meeting of the National Assembly the Independents and the Spartacides were still endeavoring to embarrass the new government, and a congress of soldiers' councils was called in Berlin. The main difficulties before the new government were the control of the army and the menace of Bolshevism as embodied in the Spartacide movement. Precautions were taken by the government to protect the Assembly from possible Spartacide attack, a considerable force being sent from Berlin to surround the town. In the first week of February fighting was reported between the Spartacides and the government troops in the city of Bremen. According to the press the government at the end of February was in danger of overthrow. The strikes in Central Germany were said to be entirely political in their aim, the workmen demanding that their committees should have control of the mines and the iron industries. The railway men were also making similar demands. It was reported that the Republican guard could not be trusted by the government. The prime minister, Scheidemann, was believed to be losing control since he had underestimated the public demand for extreme democratic measures. The country as a whole was described as turning toward the Soviet and fast outgrowing the moderate spirit of the National Assembly. At this time the situation was analyzed in prominent newspapers as follows: The revolution of November 9th was characterized as an uprising of the masses against those who had deprived them of food for the past four years and a half. Its leaders were Socialist doctrinaires who promised a Socialist régime. They failed to realize this the moment they came into power, and they were then divided as to policy, some demanding a complete break with the past, and others urging a compromise. There was not only a split between the two Socialist sections, but a break with the Bavarian element that insisted upon the separation of the southern states from Prussia. The new Assembly appeared to be nothing more than the old Reichstag revived, and it was in danger of being superseded not by a rising of the great mass of the people, but by the efforts of a determined minority against a majority that did not know its own mind. At the end of February the extremist element was reported to be fast gaining ground, and in Bavaria the communistic system seemed on the point of triumph. The government was harassed by the reactionaries on the one hand and the revolutionists on the other, while economic discontent showed itself in repeated strikes. In Bavaria the reactionaries started a revolt, which was greatly stimulated by the murder on February 21st of the Bavarian Prime Minister, Kurt Eisner, by a former officer in the Prussian Guard. (See Paragraph below.) In Saxony a movement was started by the Spartacides to overthrow the government. In Berlin almost every day there were terrorist demonstrations against the assembly. On March 2d the government made an appeal to the nation against the attempts of the terrorists and declared that it would wage a relentless war upon them. There was a crisis early in March when the Independent Socialists made it plain that they too intended to overthrow the government. There was a large strike in Berlin on March 3d, which finally became a revolt of the radical element and spread to Bremen, Leipzig, Zeitz,

Hamburg, Königsberg and other cities and fighting ensued.

REVOLTS OF THE SPARTACIDES. On March 8th the insurrection of the Spartacides in Berlin was still going on. Street barricades were set up and nests of machine guns were hidden in various parts of the city, which the government forces sought out by means of aeroplanes. There was continuous fighting in the Moabit quarter. For several days the city was without newspapers or news. On March 10th, however, it was reported that the so-called general strike had come to an end, but the government troops were still occupied in clearing certain quarters of the city, such as Neu Kölln. Charges that the Spartacides had resorted to acts of brutality were frequently made, and it was said that on March 8th organized bodies of criminals, who had captured the police, murdered a large number of them. In Lichtenberg 57 of the police officials were said to have been murdered by the Spartacides, and there was severe fighting going on there in the first week of March. On March 15th Herr Noske in the course of an address at the National Assembly, declaring that the insurrection in Berlin had been completely suppressed, attributed the responsibility for the revolt to the incitements of party organs, and the support of the movement by the extremists. This brought out protests from the Independent Socialists, but he repeated the charge that members of the Independent Socialists approved and encouraged these infamous practices. He said that the movement had fortunately turned out to be a failure, and that the rebellious marine detachment which had been the chief instrument in causing trouble existed no longer. From the opposition benches came the cry, "You have murdered them all," and he was loudly hissed by the minority element, but applauded with equal vigor by the majority. Nevertheless from public speeches and from the press it appeared that people generally feared a new outbreak at an early date. The newspapers of all shades of opinion published elaborate stories of atrocities in Berlin. Cases were cited of persons who were dragged into the street and literally torn to pieces by the mob. Among those who had been killed under peculiarly brutal circumstances were several officers including the commandant who had been sent to direct the Weimar defense force. During the previous riots in the industrial Rhenish and Westphalian districts, the Spartacides were said to have shot women and children, and in some instances clubbed them to death. The newspaper reports published in English did not contain the mention of any atrocity on the part of the government troops or supporters. All atrocities and murders throughout the revolt occurred, according to the press, exclusively at the hands of Spartacides.

Toward the end of March the government agreed to recognize the councils of workmen and soldiers as factors of economic life, but not as political bodies. Thereupon (March 28th) the Independent Liberal, Haase, made a savage attack upon the Minister of War to which the latter replied that the radical press was responsible for the acts of violence in Berlin. On the other hand the ministers displeased the Conservatives and Centre by conceding too much to the radicals. The disorders continued throughout the country in April, May, and June. There were strikes and riots at Stettin, Lübeck and

Breslau. There were serious disturbances in Füssen and throughout Westphalia. In the mines of the Ruhr Basin over 350,000 strikers left the mines demanding increased wages and a six-hour day, release of political prisoners and the recall of government troops. Vigorous attempts to set up Spartacide governments were made in Munich, Hamburg, Magdeburg, Bremen, Brunswick, Düsseldorf, and other places. The revolt at Munich was put down (see below) and the suppression of disorders followed in other parts of Germany. The riots in Baden, Brunswick, Dresden, and other centres were to some extent quieted by the threat of Director-General Hoover to cut off food supplies. At the beginning of April the outlook was still dark as regards Bolshevism which was said to be working by means of propaganda and by strikes for the immediate purpose of paralyzing industry. The Spartacides were trying to get control of the localities by setting up Soviets in the towns and villages. The Soldiers', Workmen's, and Peasants' Councils formed a congress which met in Berlin April 7th and constituted the following parties: Majority Socialists, 138; Independent Socialists including Austrians, 55; Democrats, 12; Peasants' League Members, 3; and Communists, 3. Little was accomplished on account of the rivalry between groups. A general strike broke out in Berlin, the workmen demanding a voice in the management of industry, and it was settled on April 19th by a virtual admission of their claims.

THE ASSASSINATION OF EISNER: BAVARIAN DISORDERS. On February 21st, it was announced that the Prime Minister of Bavaria who, since the revolution of 1918, had held the position of virtual dictator, had been assassinated by an army officer, Count Arco Valley. (See EISNER, KURT.) The murder was attributed to the well known separatist policy of the Bavarian Premier who had violently attacked Prussia, and who, in November, 1918, had broken off relations with Berlin. According to a Berlin newspaper, the characteristic of the Bavarian revolution from the first had been its aversion toward the idea of the empire, and its hatred for the symbol of national unity, the red, white, and black flag. On April 6th a Soviet republic was declared in Munich as a result of the Bavarian hatred of Prussia and opposition to the National Assembly. It was immediately followed by the declaration that all property in the community was socialized but it lasted for only a brief time. The Prime Minister, Hoffmann, after an attempt to suppress the extremists, appealed for aid to the central government, which, through President Ebert, replied on April 21st by sending 30,000 troops under the command of Noske, and the Soviet government fell immediately. The revolts in Bavaria were estimated to have caused property losses amounting to \$62,500,000.

NATIONAL ASSEMBLY. The National Assembly opened at Weimar on February 6th. The government was much alarmed by demonstrations of the Spartacides and took elaborate precautions to preserve her order. At its opening meeting Herr Ebert made a speech in which he protested vigorously against the terms of the armistice, warning the Allies not to try his countrymen beyond the limit of endurance. He demanded the union of Germany and Austria, and asserted the right of Germany to take its place in the League of Nations. A working

agreement on the part of the Majority Socialists, Democrats, and Centre party was worked out, and the coalition cabinet representing these three parties in proportion to their numerical importance was planned. There was a tendency on the part of the leaders to decline responsibility if the terms of the Allies were too hard. The question of the draft of the constitution came up early in the session, and also the plan for a provisional constitution ending in the adoption of the final instrument.

The provisional constitution gave the Assembly power to adopt a permanent constitution; to enact such laws as were urgently needed; to choose the President by majority vote; and to form a committee of state which would serve in part as a second chamber. It provided also that the territory of the German states should not be changed without their consent. On February 11th the election of the provisional president gave Ebert 277 out of a total of 397 votes. The opposing candidates were the Monarchist Count Von Powadowsky-Wehner, who received 49 votes, and Scheidemann and Erzberger who received one vote each. The new President's first act was to ask Scheidemann to form a ministry, and a coalition cabinet was created as follows: Socialists, 7; Democrats, 3; Centrists, 3; and Nationalist, 1. The new Chancellor, Scheidemann, appointed as Minister of Economics, Dr. August Mueller; as Minister of Labor, Bauer; and as Minister of National Defense and Justice, Landsberg. Dr. David having resigned, Fehrenbach became president of the Assembly. Other members of the cabinet were Erzberger, who entered the government without portfolio, and Count von Brockdorff-Rantzau, who succeeded Dr. Solf in the foreign office. One of the first matters to come up before the new government was the armistice terms and its decision to sign them led to the immediate resignation of Count von Brockdorff who was opposed to them, but after receiving from the government guarantees that the armistice commission would be more directly under the control of the foreign office he consented to remain in his position. For the constitution as finally adopted, see above under *Government*.

RELATIONS WITH THE ALLIES. The German peace delegates were preparing to go to the conference at the end of March. Meanwhile the question of feeding Germany had been widely discussed among the Allies, and fear had been expressed that the governments intended to supply food at their own expense, but on March 13th it was announced by a representative of the Peace Conference that the needs of the Allies and of the new states in eastern and south eastern Europe would be met before Germany was provisioned. On March 17th it was reported that Germany had accepted the Allied terms in regard to the supply of food, and handing over her shipping amounting to about 3,500,000 tons. She was to receive 300,000 tons of cereals and 70,000 tons of fats per month, and payment for the food-stuffs was to be made by the freight of German ships used for Allied purposes, by certain exports which were permitted, and by credits in neutral countries. Germany was to deposit £18,000,000 in the National Bank of Belgium, which was to be regarded as a guarantee. In Socialist quarters the rejection of the Allied peace terms was discussed, and it was said that Germany had new weapons of defense if the

Allies pushed her to extremities. It was evident that in certain political circles the refusal of the terms would be welcomed. See **WAR OF THE NATIONS**.

THE PEACE TERMS. Field-Marshal von Hindenburg resigned May 2d, the resignation to go into effect upon the conclusion of peace. On May 7th a draft of the peace treaty was handed to the German peace delegation. They had been required to appoint delegates who were responsible and could speak with authority and they chose finally the following: Count von Brockdorff-Rantzau, Foreign Minister; Herr Landsberg, Minister of Justice; Dr. Melchior, general manager of the Warburg Bank; Herr Leinert, president of the Prussian Assembly; Herr Giesberts, Minister of Posts and Telegraphs; and Herr Scheuecking. Along with them went many experts in the fields of industry, finance, and labor, as well as professional and business men. The peace terms caused a storm of protest throughout the country and united all parties in condemnation of it. It was remarked by President Ebert that history held no precedent for such determination to annihilate a vanquished people. The point of view of the Socialists was briefly expressed in the Socialists paper *Vorwarts*, which said that the two conquered parties in the war were the German people and the American idea. The Liberal leader and editor Theodor Wolff declared that the treaty ought not to be signed. The moderate Prince Liehnowsky who had incurred the hatred of the imperial government by his revelations of its pre-war policy called it a piece of violence which would destroy Germany; the Liberal, Erzberger, said it was not only unacceptable but impossible to fulfill, and the well-known publicist, Delbrück, threatened to open the gates to Bolshevism rather than sign. The government through its delegates made extreme efforts to secure changes in the severe terms of the treaty. Finally on June 16th the peace treaty as completed was handed to the delegates. Immediately there was a crisis in the government which caused a different grouping of parties. In the first place the Foreign Minister, Rantzau, refused to sign unless radical changes were made and in this attitude Scheidemann, Giesberts, Landsberg, and Dernberg shared, while Noske, Erzberger, and David favored acceptance. The parties were divided by the issue. The Majority Socialists stood 75 to 30 in its favor; the Democrats, 5 opposed and 8 in favor; the Centrists, 69 in favor of conditional acceptance and 4 in favor of unconditional acceptance. Thereupon (June 21st) the Scheidemann cabinet resigned and was succeeded by another coalition government pledged to the acceptance of the treaty. The Prime Minister was Dr. Gustave Bauer, Socialist, former Minister of Labor, and the other members were as follows: Dr. Herman Müller, Majority Socialist leader, Foreign Affairs; Erzberger, Vice-Premier; Dr. David, Interior; Herr Wissell, Economics; Herr Schilke, Labor; Herr Meyer, Finance; Herr Giesberts, Posts and Telegraphs; Dr. Paul, Colonies; Noske, National Defense; and Dr. Robert Schmidt, Food. On June 22d a resolution offered by Haase to the effect that the National Assembly agree to sign the treaty was passed by a vote of 237 to 138, the Prime Minister having informed the Assembly of the Ministry's intention to sign. The reactionary press made severe at

tacks upon the government for its action, but on July 9th the treaty was ratified by a vote of 208 to 115 (99 Deputies not voting). After the ratification the government applied itself to the question of economic restoration and to the carrying out of the terms of the treaty in regard to Poland.

DISORDERS IN THE SUMMER TIME. In May and June during and after the discussion of ratification there were conflicts in West Prussia and Silesia, where the German element showed a spirit of resistance against the Polish occupation and there was trouble also in other parts of the eastern provinces. Moreover in the west much anxiety was caused by the movement to separate the Rhenish provinces and set up a republic of the Rhine. This took the form on June 1st of a declaration of independence and a provisional government was set up at Wiesbaden under the protection of French troops, but the plan soon failed on account of the lack of support from the German population and the German troops drove the self-appointed republicans from office.

RELATIONS WITH RUSSIA. German policy appeared to be directed toward an eventual economic accord with Russia, whichever side should triumph. While the army of von der Goltz was operating on the anti-Bolshevist side in Courland, the German government was said to be maintaining as far as possible relations with the Moscow government of the Soviets. From the point of view of the military party the restoration of the old system in Russia was desirable as involving the return of the Hohenzollerns in Germany. Their plan was to seize in the East the power that had been lost in the West. From all points of view the economic development by German capital of the colonization of Russia offered immense opportunities, for the country was an inexhaustible reservoir of food, raw materials, etc., and afforded an enormous market for the products of German industry. According to a German pamphleteer it should be the aim of Germany to bring Russia to purchase all the manufactured articles that it needed from a pin to an automobile. It was said to be a part of the German plan to send large bodies of engineers, foremen, and workmen, into Russia. By these means Germany would rid herself of her unemployed workmen and her excess of population, turning toward the East the emigration that had previously been directed toward America. A campaign of education was carried on in Germany to familiarize citizens with Russian resources, and the advantages of colonization. Companies were founded to raise capital for the purchase of wide tracts of Russian land, to be distributed among the disbanded German soldiers. German pioneers had multiplied in certain parts of Russia, especially in the Ukraine, in Crimea, and along the banks of the Volga before 1914, and these regions offered good opportunities at the present time. The German colonists were said to have kept their language, schools, churches, and other German institutions. An "Institute of Eastern Europe" was founded in connection with the University of Breslau as a sort of central office for the instruction of possible colonists, and it was distributing in 1919 large numbers of pamphlets on conditions of emigration, on the mines of the Donetz, the oil wells of Baku, the resources of Siberia, etc. Similar institutions existed at

Stuttgart under the title of an "Institution of German Expansion Abroad," and published information on the Baltic countries. A plan was formed at Berlin for a ministry of emigration which would dispatch to Russia and other countries consuls and other officers who would promote and supervise German penetration abroad. Several periodicals were devoted to these purposes. The institute at Breslau submitted a bill to the government making it obligatory in all the Prussian schools to study the Russian language. Courses in Russian were given at Berlin, and the libraries were provided with large numbers of Russian dictionaries, grammars, manuals, etc. In short, the Germans seemed to be aiming at the eventual colonization of Russia whether or not the country passed under a different régime. The Moscow government was said to be maintaining agents at Berlin. Workmen out of employment who had perhaps been influenced by propaganda of these agents were demanding the immediate resumption of commercial relations between Germany and the Russian Soviet government. It was reported in October that a Bolshevik delegation had arrived in Germany for the purpose of organizing bureaus of emigration, and of recruiting some 800,000 of the unemployed to be sent to Russia for supplementing the man power in its industries.

SITUATION AT THE CLOSE OF THE YEAR. The immediate future of the government seemed uncertain. There were signs that it could not last long. The parties of the Right were constantly stirring up public opinion in order to influence the elections and they predicted that the present government would be overthrown. The danger of such an event was that a dictatorship would succeed and that this again would give place to a return of the Hohenzollerns. The Polish danger was another feature of the situation. Germans considered themselves as far superior to the Poles as the English to the Zulus, that is to say, superior not only in race but in intellect. According to some observers Germany was tending toward a union under Prussia. Even if the Hohenzollerns were brought back there would certainly be none of the secondary dynasties. It was said that the Assembly was no longer German and that the southern states like Bavaria were renouncing their system of taxes and all independent administration. In that case there would be a German king. After the present government should be overthrown there would be a foreign policy inspired by the same motives as before the war and it would have behind it a powerful army. This point of view was that of the conservative or reactionary element in Germany and those who particularly feared this element abroad.

Observers declared at the close of the year that the government whether it wished or not was gradually falling under the control of the Left. The workmen had become three times as numerous as they were before the war and had lost the habit of steady work, passing their time in political discussion and in criticism of the authorities. The Socialist newspaper *Vorwärts* declared that the celebrated talent of Germany for organization had been destroyed by the absurd system which prevailed. The administration was divided against itself and fell into long discussions which led to nothing. One

of the government organs had declared that the only way to put things in order was to set up a dictatorship. Socialist newspapers were predicting the break-down of the present coalition and accusing the Democrats of being at bottom just as reactionary as the bourgeois parties. They said it would be a wise policy to separate from them. Bad conditions prevailed on the railways. The government suspended the passenger service in order that freight trains might circulate freely but an attempt to carry this out was blocked by the inefficiency or ill-will of the officials. The new ministry of railroads was unsympathetic with the plan and hindered its execution. It was reported that in all parts of the country the lines were functioning badly. At the close of the year an alliance of Socialist groups was proposed and an association was founded to bring about a Socialist *bloc*, which policy had the support of Scheidemann as a means of avoiding defeat in the coming elections. The Majority Socialists had in fact failed in its recent appeals to the people. In Upper Silésia they had lost seats everywhere and returned only a few candidates. The Poles and the Independents had profited in the campaign from the mistakes of the government administrator in dealing with the strikers in August. It was reported that the Majority Socialists realizing their weakness and desiring to retain power at any cost were ready to make terms with the Independents and even with the Communists. For example the association above mentioned known as the League of Socialist Union issued toward the close of the year a pamphlet pointing the way to a reconciliation of the Socialist groups and as the first condition it demanded dissolution of the imperial troops and the substitution for them of a popular guard, which should suppress counter-revolutions and which should have a democratic basis, nominating its own officers and not living under barrack discipline—in short a sort of red guard composed of the working classes. Noske had caused the book to be seized upon its publication but immediately afterwards Scheidemann had made the same proposal in regard to the army. Thus it appeared that the elements hostile to Noske and to his policies in respect to the police and the military were uniting. The situation of the German republic was even compared to that of the Kerensky government in Russia just before its downfall. There was not much faith to be placed in the elections, according to some authorities, for the reason that the revolutionary element had become so strong that unless the elections conformed to their wishes they would at once proceed to violent measures and declare a general strike or try to stir up a revolt. If, however, the present government should maintain the army on its present footing and the civil guards in the country districts, it might be able to resist such a movement. Hence the desire of the extreme Socialists to destroy the present military and police system. The above account represents the point of view of the moderate element in Germany, many of whom believed that the danger of extreme radicalism had not passed but that there were serious troubles ahead.

ATTITUDE OF THE INTELLECTUALS. A significant manifesto was issued in the beginning of the year by 70 professors of the University of Heidelberg, which illustrated the point of view of the

strong element that feared the government was acting counter to the national interests. It declared that the publication of documents purporting to prove the guilt of the imperial government was a suicidal policy, for the enemies of Germany would never publish documents on their side showing responsibility for the war, and they would justify themselves by what the Germans admitted for a policy of severe chastisement. They demanded that there should immediately and constantly be published conclusive proofs charging the chief responsibilities for the war against the enemy, as for example, the political encirclement of Germany; the Russian mobilization as the direct cause of the war, according to the revelations at the trial of Soukhomlinov; and finally, the vengeful spirit of France as illustrated by the accusations of Jaurès. They declared it should be proved to the world and to President Wilson in particular that France in her spirit of conquest had possessed herself of territory that was purely German and would forever be an inseparable part of the German Empire. The manifesto concluded as follows: "In the face of the violence employed against them, which assumed the rôle of an avenging justice, the Germans have no more urgent duty than to prove to the world constantly that their enemies are responsible for the war and are impelled by the motive of conquest. As to our people which to-day is concerned exclusively with its internal affairs, its governors must never weary of assuring it that it is threatened from without by the gravest danger to its existence and to its future, in order that it may lay aside its internal quarrels which in the long run expose the country to the risk of further dismemberment. To offset this it should organize a new grouping of the intellectual elements." See **WAR OF THE NATIONS; UNEMPLOYMENT; ARBITRATION AND CONCILIATION; INDUSTRIAL; TRADE UNIONS; EXPOSITIONS; etc.**

GIBRALTAR. The narrow peninsula on the southwest coast of Spain, commanding the entrance to the Mediterranean. The Rock of Gibraltar is a British crown colony. Area, 1½ square miles; fixed population, estimated Jan. 1, 1918, 16,549 (8105 males and 8444 females), comprising for the most part descendants of Spanish and Italian settlers; alien population, about 10,400. Gibraltar is an important naval base and coaling station. Revenue (1917), £125,876; expenditure, £119,636; total tonnage entered, 9,711,227 (British, 3,955,979); cleared, 9,382,234 (British, 3,791,195). The customs revenue in 1917 was £45,951. Governor at the beginning of 1919, Gen. Sir Horace L. Smith-Dorrien.

GIBSON, H. GRAEME. British physician, known as one of the discoverers of the germ of the Spanish influenza, died at Abbéville, France, in November. For a long time past he had been working along with others to isolate the influenza germ. On Dec. 14, 1918, a preliminary statement was published by him and his colleagues, but the work was not then complete. At the time of his death the work was reported to have been successfully finished.

GOLD. The production of gold suffered a further decline in 1918, though when the YEAR

Book went to press no authoritative and complete estimates for the year were available. The reasons for the decreased output obviously were the fixed price of the product and the rising costs ranging from labor to supplies. In fact it was possible to work only the richer deposits unless silver was also secured, and there were stories during the year of dredging plants being dismantled and shipped to localities where they could be operated with hope of greater return. The inflation in the currency systems of the world naturally had its effect on the demand and movement of gold, which was restricted by the extraordinary conditions following the war.

The production of gold in the United States in 1919 was estimated at 2,829,395 fine ounces, valued at \$58,488,800, or as the accompanying table shows, a decline of \$10,157,900 in value from 1918. California was the only State of the union showing increased production in 1919.

GOLD PRODUCTION OF UNITED STATES, 1918 AND 1919

ESTIMATES OF THE U S MINT AND U S GEOLOGICAL
SURVEY

(Figures for 1919 preliminary statistics subject to
revision)

	1918	1919
Alabama	\$700	
Alaska	9,424,700	\$9,036,300
Arizona	5,583,000	4,176,500
California	16,784,400	17,380,000
Colorado	12,724,700	9,736,400
Georgia	4,500	1,000
Idaho	701,400	710,400
Maine	700	100
Missouri	60	100
Montana	3,280,700	2,461,700
Nevada	6,700,440	4,754,600
New Mexico	687,080	595,700
North Carolina	4,400	1,000
Oregon	1,265,700	1,071,800
South Carolina		100
South Dakota	6,699,400	5,267,600
Tennessee	5,600	5,800
Texas	20	1,100
Utah	3,153,000	2,152,700
Vermont	1,000	200
Virginia	400	
Washington	333,800	309,800
Wyoming	900	300
Continental U S	\$67,356,600	\$57,662,700
Philippines	1,290,000	826,100
Porto Rico	100	
Total	\$68,646,700	\$58,488,800

In the calendar year 1919 the exports of gold from the United States amounted to \$368,144,000 while the imports were \$76,534,000, or an excess of exports of \$291,610,000. In 1918 there was an excess of imports of \$20,972,000, the imports totaling \$62,042,000, while the exports were \$41,972,000. Exports of gold were to the Orient and to South America. For example, in November, 1919, the exports ran as follows:

Argentina	\$8,900,000	Spain	650,000
China	1,786,420	All other	7,686,405
India	3,953,780		
Hongkong	5,362,790	Total	\$51,857,796
Japan	23,518,395		

The decreased gold production in the United States found its counterpart elsewhere in the world on account of practically the same conditions. In British Columbia there was an estimated decline from 180,674 ounces in 1918 to 150,050 in 1919; in the Transvaal from an out-

put valued at £35,768,688 in 1918 to a value of £35,557,507 in 1919; in Australia from 1,277,953 fine ounces in 1918 to 1,141,541 in 1919; in New Zealand from 189,159 fine ounces in 1918 to 180,000 in 1919. In Rhodesia the output was larger for 10 months, amounting to £2,154,203, as compared with £2,652,250 for the year 1918 and £3,495,391 for the year 1917.

In the generally unsettled condition of the world, preliminary statistics were of comparatively little value and accordingly attention is directed to the accompanying figures of gold production by countries for 1918 and two earlier years and for the total production for 20 years ended 1918, the figures, except as otherwise noted, being those of the *Engineering and Mining Journal* of New York. See METALLURGY; SILVER

GOLD PRODUCTION OF THE WORLD *a*

	1916	1917	1918
United States	\$92,590,300	\$83,750,700	\$68,646,700
Canada	19,235,000	15,273,000	14,687,900
Mexico	7,690,700	9,000,000	16,824,700

1905	378,411,754	1915	473,124,590
1906	405,551,022	1916	<i>a</i> 451,176,500
1907	411,294,458	1917	<i>a</i> 419,422,100
1908	443,434,527	1918	380,924,700

a As reported by the Director of the Mint

As already indicated figures are now at hand showing a drop occurred in the gold output in the Transvaal. South Africa, during 1919, in which year 8,330,091 ounces of gold were produced, against 8,418,292 ounces in 1918, a decrease of 88,200 ounces. Annual gold output from this, the most important gold area in the world, dropped almost 1,000,000 ounces in the past three years as the following shows:

Gold production in South Africa in the year 1915, 9,093,902 fine ounces; 1916, 9,296,618; 1917, 9,018,084; 1918, 8,418,292; 1919, 8,330,091.

Although the decrease in 1919 was not as marked as that of 1918 over 1917, it showed the general world-wide curtailment of gold production.

Gold production in Australia also showed a marked decrease, and for the first 10 months of 1919 amounted to 914,957 ounces, against 1,073,617 ounces for a similar period in 1918.

In a statement issued by the U. S. Bureau of Mines it was recorded that ever since June 7th, when the embargo on the export of gold was lifted, there has been steady and heavy outflow of gold from this country, as a consequence of which considerable gold accumulated during the war has been exported. It will be noted from June 1, 1919, to Jan. 1, 1920, the decrease has been nearly \$305,000,000, which is over one quar-

ter of the \$1,200,000,000 in gold gained during the war. The shipments of gold will tend to stabilize the value of the dollar in those countries in which the balance of trade is unfavorable to the United States.

From Aug. 1, 1914, to Dec. 31, 1918, or particularly during the period of the war, the excess of imports of gold over exports totaled \$1,234,835,000, while the year 1919 showed a movement in the other direction of an excess of exports over imports amounting to \$292,151,000.

GOLD COAST. A British colony on the Gulf of Guinea extending for 334 miles along the coast and comprising besides the colony, a protectorate, and Ashanti. Total area, about 80,000 square miles; population since 1911, 1,503,386, of whom the Europeans in 1915 numbered 2206. The capital and chief town is Accra (19,585) and other large towns are Cape Coast Castle (11,364); Secondee (7725). The following table shows the imports and exports, revenue and expenditures for 1914 to 1917 inclusive:

	1914	1915	1916	1917
	£	£	£	£
Imports *..	4,456,968	4,509,538	5,999,749	3,386,480
Exports *	4,942,656	6,943,631	5,816,527	6,346,925
Revenue ..	1,831,713	1,456,130	1,835,989	1,624,124
Expend ..	1,755,850	1,627,015	1,465,946	1,424,279

* Including bullion and specie

The overseas trade in 1918 was less than that of any previous year of the war or any year immediately preceding the war. The chief articles of import were cotton goods, machinery, soap, distilled spirits, clothing, building materials, and provisions. The United Kingdom supplied 73 per cent of the imports and the United States 21 per cent. The total value of imports was \$14,208,306. The exports included palm kernels, palm oil, kola nuts, cocoa, rubber, and copra. The three last-named decreased in 1918 on account of the difficulty of obtaining shipping space. The United Kingdom received 47 per cent of the exports as comparing with 65 per cent in 1917 and the United States received 37 per cent as comparing with 18 per cent in 1917. A notable feature of the year 1919 was the discovery of diamonds in the region about Abomo Su in February. The condition of the gravel in which they were found indicated that they were derived from a granite pegmatite area.

The northern territories lie to the east and south of the French possessions and to the west of Togo. Their population is variously estimated and may be given as about 360,000.

GOLF. All the golf championship tournaments were held in the United States in 1919 for the first time in three years. Among the professional players to distinguish themselves were Walter C. Hagen and James Barnes, while the leading amateurs were S. Davidson Herron, Charles Evans, Francis Ouimet and Robert T. Jones, Jr. Hagen captured the open and Metropolitan titles, while Barnes triumphed in the Western, Southern and professional tourneys. Herron won the amateur fixture and to Evans went the honor of leading all the amateurs in the open championship.

Ouimet finished second among the amateurs in the open tournament and defeated Evans in the amateur championship. Jones was the runner-up in the amateur tourney, tied for second place with Barnes in the Canadian open and

finished second to Barnes in the Southern open.

The results of the various championship tournaments held during the year follow:

United States Open Championship played at Boston won by Walter C. Hagen of Detroit after a play-off with M. J. Brady of Watertown, Mass., both having a score of 301.

United States Amateur Championship played at Oakmont C. C., Pittsburgh, Pa., won by S. Davidson Herron of Pittsburgh, who defeated Robert T. Jones, Jr., of Atlanta, 5 and 4.

United States Women's Championship played at Shawnee-on-Delaware, Pa., won by Miss Alexa W. Stirling of Atlanta, who defeated Mrs. W. A. Gavin of Bay Shore, L. I., 6 and 5.

Western Open Championship played at Cleveland, Ohio, won by James Barnes with 283, Leo Diegel, runner-up with 286.

Professional Golfers' Association Championship played at Roslyn, L. I., won by James Barnes, who defeated Fred McLeod, 6 and 5.

Southern Amateur Championship played at New Orleans, La., won by Nelson Whitney, who defeated Louis Jacoby, 12 and 11.

Southern Open Championship played at Atlanta, won by James Barnes with 293, runner-up Robert T. Jones, Jr., with 294.

Metropolitan Association Amateur Tournament won by Oswald Kirkby, who defeated A. L. Walker, Jr., 2 and 1.

Metropolitan Association Open Tournament won by Walter C. Hagen with 294, runner-up, E. French with 297.

The New York team was victorious in the Griscom Cup matches, defeating Philadelphia by 12 matches to 3 and Boston by 13 matches to 2. In the Lesley Cup matches Pennsylvania defeated New York 9 to 6 and Boston 10 to 5. Princeton University won the inter-collegiate championship with Harvard second and Yale third. The individual honors went to A. L. Walker, Jr., of Columbia University.

The Allied Team Championship played at La Boule, near Versailles, France, was won by the French who defeated the Americans in the final round by 8 to 4. Sergeant W. Rautenbush captured the A. E. F. championship at Nice, where he defeated Lieut. J. W. Hubbell 6 and 5.

GOODWIN, NATHANIEL CARL. American actor, better known as NAT GOODWIN, died in New York City on January 31st. He was born at Boston, July 25, 1857, educated at public and private schools, and made his appearance with Stuart Robson in Boston, in 1873. Thenceforth he appeared frequently in comedy parts, and after 1890 starred in some of the most successful light pieces of the time. He had a marked gift as a comedian and was long a public favorite. Though versatile in comedy parts, he was not especially successful in more serious undertakings, although he appeared with credit even in Shakespearean drama. Aside from his professional reputation he was a marked figure, and the subject of much humorous discussion, on account of his frequent marriages and divorces—an eminence which he himself recognized by the publication of a book entitled *Why Beautiful Women Marry Nat Goodwin*. He was married five times and divorced four times, and was about to be married the sixth time when he was taken with his last illness. Among his successive wives may be mentioned: Maxine Elliott; Edna Goodrich; Marjorie Moreland. He visited England several times, but his ap-

pearance there on the last occasion in 1906 was unsuccessful. Space is lacking for mention here of all the plays in which he made a notable success. The following list represents only a small portion of the productions in which he appeared: *Black Eyed Susan*; *Rice's Evangeline*; *Hobbies*; *The Member from Slocum*; *In Mizoura*; *Nathan Hale*; *The Skating Rink*; *Cruets*; *Confusion*; *Turned Up*; *A Gilded Fool*; *David Garrick*; *The Rivals*; *An American Citizen*; *The Cowboy and the Lady* (1899); and *When We Were Twenty-One* (1900). He also played Shylock, in *The Merchant of Venice* (1901); appeared in *The Altar of Friendship* (1902); *The Usurper* (1903); played Bottom, in *A Midsummer Night's Dream* (1904); starred in *The Beauty and the Barge* (1905); *Wolfville*, and *The Genius* (1906); *What Would a Gentleman Do*; *The Master Hand*; and *The Easterner* (1908-09).

GORIZIA. The Italian name of Görz, capital of the former crownland of Austria, Görz and Gradisca (q.v.).

GÖRZ AND GRADISCA. Before the dissolution of the Austro-Hungarian Empire, a crownland of Austria. For statistics, see preceding YEAR BOOKS. It was part of the territory formed after October, 1918, into the new state of Jugo-Slavia (q.v.).

GOUCHER COLLEGE. A non-sectarian institution for the education of women, founded in 1885 at Baltimore, Md. The enrollment in the fall of 1919 was 790, with 74 members of the faculty, 23 of whom were appointed in 1919. The library contained 35,000 volumes. The college had an endowment of \$1,200,000; the income for the year was \$187,000. President, William Westley Guth, S.T.B., Ph.D.

GOVERNMENT OWNERSHIP. See RAILWAYS.

GRANT, SIR ALFRED HAMILTON. Representative of British India at the Paris Peace Conference. He had seen service during many years in the Punjab and the northwest frontier provinces, and was made foreign secretary to the government of India in March, 1915.

GRAPHITE. The quantity of domestic crystalline graphite marketed in 1918, according to the final figures compiled by the United States Geological Survey, was 12,861,839 pounds valued at \$1,454,799 compared with 10,564,080 pounds valued at \$1,074,398 in 1917. Alabama lead production with 7,795,475 pounds of a value of \$999,152; New York produced 3,266,518 pounds valued at \$273,188; Pennsylvania sold 1,016,900 pounds for \$112,059; while California, Montana, and Texas, combined, contributed 782,946 pounds of a value of \$70,400.

Amorphous graphite to the amount of 6560 short tons, valued at \$69,455, was sold from mines in Colorado, Nevada, and Rhode Island during 1918. The output of amorphous graphite in 1917 was 8301 short tons, valued at \$73,481.

GRAVES, HERBERT C. Hydrographer, died in London on July 26th. He was born in 1860 and he was representing the United States after June 12, 1919, at the International Hydrographic Conference and one of the delegates also from the American section of the proposed International Geophysical Union which met in Brussels in July. He had been in charge of the coast surveys under the Coast and Geodetic Survey.

GREAT BRITAIN. THE UNITED KINGDOM OF GREAT BRITAIN AND IRELAND is a constitutional monarchy whose capital is London. Although

the term Great Britain applies literally only to England, Scotland and Wales it is often used as above to mean the United Kingdom. Attached to the United Kingdom are the Isle of Man and the Channel Islands. The United Kingdom and its possessions or dependencies, that is to say the dominions and colonies, and other territories subject to the ultimate control of Parliament constitute the British Empire.

AREA AND POPULATION. The area of the United Kingdom is 121,331 square miles; including the Isle of Man and the Channel Islands, 121,633 square miles. The population of the United Kingdom as estimated for June 30, 1914, just before the outbreak of the war was 46,089,249 of whom 36,960,684 were in England and Wales, 4,747,167 in Scotland, and 4,381,398 in Ireland. The civil population for England and Wales was estimated for June 30, 1918 at 33,474,700 and the population of Scotland and Ireland, respectively, at 14,886,300, and 4,337,000. For details of population based on the 1911 census see preceding YEAR BOOKS. The estimated population of Greater London (about 693 square miles), in 1917, 6,726,753 (civil population only), for the administrative county of London, 4,026,901. The estimated population of the three next largest cities of England in 1917 (civil population only), was as follows: Birmingham, 870,271; Liverpool, 716,141; Manchester, 660,143. The estimated borough population of the two largest cities of Scotland in 1918 (civil population only), was as follows: Glasgow, 1,111,428; Edinburgh, 333,883. The estimated population of the two largest cities in 1917 of Ireland was: Dublin (registration area), 399,000; Belfast, 393,000. The movement of population in England and Wales for 1918 (provisional figures), was as follows: Total births, 662,773; deaths, 611,991; marriages, 286,807. For Scotland in 1918 it was: Total births, 98,550; deaths, 78,359; marriages, 34,594. For Ireland in 1918 it was: Total births 87,563; deaths, 78,685. In 1916 the total emigration was 93,889 and the total immigration 98,583. The destination of the emigrants was mainly the United States and North America.

EDUCATION. On July 31, 1917, the number of elementary schools in England and Wales was 21,464 and the number of pupils enrolled on Jan. 31, 1917 was 5,979,889. The average attendance in 1916-1917 was 5,299,000. In Scotland the elementary schools in receipt of grants in 1917 was 3363 with 743,725 in attendance. In Ireland in 1917 the elementary schools numbered 8060 with 699,472 pupils enrolled and 488,785 in attendance. The attendance at the universities was greatly diminished as a result of the war. The following table published by the *Statesman's Year Book* for 1919, estimates the number on teaching staffs and the number of students in the universities of the United Kingdom in 1918-19:

Universities	No. of Professors, etc.	No. of Pupils
England—		
Oxford	100	1,500
Cambridge	134	1,700
Durham	132	950
London	1,140	3,300
Manchester	270	1,480
Birmingham	100	900
Liverpool	185	1,200
Leeds	151	1,110

<i>Universities</i>	<i>No. of Professors, &c.</i>	<i>No of Pupils</i>
Sheffield	141	1,900
Bristol	210	700
Total for England	2,563	15,640
Scotland—		
St. Andrews	84	420
Glasgow	126	2,350
Aberdeen	82	880
Edinburgh	200	2,570
Total for Scotland	492	6,220
Ireland—		
Dublin (Trinity College) ..	76	850
Dublin (National)	200	1,400
Belfast	72	810
Total for Ireland	348	3,010
Wales	152	1,500
Totals of above	3,555	26,370

Very important changes were made in the educational system by the Fisher Educational Bill, which was introduced early in 1918 and became a law on Aug. 7, 1918. This raised the elementary school age to 14 years; required attendance at continuation schools from 14 to 16 until 1925, and from 14 to 18 thereafter; forbade wage labor for children under 12; limited the employment of children between 12 and 14 to two hours on Sundays and school-days, and forbade employment before 6 A.M. or after 8 P.M., gave local authorities power to provide holiday or camp schools and physical training centres, which were to be subsidized by the State; provided for medical treatment of school children to be paid by the State and for special schools for defectives, and abolished all fees in public elementary schools.

PRODUCTION. The following table from the *Statesman's Year Book* for 1919 shows the number and size of the holdings in Great Britain in 1918.

<i>Size of Holdings</i>	<i>Great Britain</i>
1-5 acres	100,792
5-50 acres	224,710
50-300 acres	153,918
Over 300 acres	16,688
Total	496,108

The following table shows the number and size of holdings in Ireland in 1917.

<i>Size of holdings</i>	<i>Leinster</i>	<i>Munster</i>	<i>Ulster</i>	<i>Connaught</i>	<i>Total Ireland</i>
Not exceeding 1 acre	39,131	33,261	32,022	8,373	112,787
Above 1 and not exceeding 5 acres ..	13,085	9,678	16,387	8,469	47,619
Above 5 and not exceeding 10 acres ..	10,645	8,076	27,920	19,421	66,062
Above 10 and not exceeding 15 acres ..	8,211	7,062	25,072	19,411	59,756
Above 15 and not exceeding 30 acres ..	18,009	20,221	48,593	36,306	123,129
Above 30 and not exceeding 50 acres ..	13,268	20,494	24,555	14,071	72,388
Above 50 and not exceeding 100 acres ..	13,055	22,406	15,127	6,588	54,476
Above 100 and not exceeding 200 acres ..	6,889	9,789	4,112	2,369	23,159
Above 200 and not exceeding 500 acres ..	2,966	2,901	1,153	1,211	8,231
Above 500 acres	666	481	310	510	1,967
Total number of holdings	125,925	134,869	195,551	116,729	572,574

According to estimates in 1918, out of the total area (exclusive of water), of 76,640,000 acres, the arable land comprised 21,221,000 acres; the permanent pasture 25,046,000; the grazing land (mountain and heath), 13,151,000 acres. The principal "corn" crops are wheat,

barley, oats, rye, beans, and peas. The cultivated area of the United Kingdom in 1918 is shown in the following table

<i>Cultivated area</i>	<i>1918 acres</i>
Corn crops	10,950,985
Green crops and flax	4,228,257
Hops	15,666
Small fruit	90,939
Bare fallow	414,124
Clover and mature grasses	5,520,796
Permanent pasture	25,045,981
Total	46,266,748

The live-stock in 1918 are shown in the following table

<i>Live stock</i>	<i>1918 Number</i>
Horses	1,916,347
Cattle	12,311,149
Sheep	27,062,681
Pigs	2,809,215

The total produce of the United Kingdom by crops is shown in the following table in thousands of quarters and thousands of tons:

<i>United Kingdom</i>	<i>Wheat 1000 qtrs</i>	<i>Barley 1000 qtrs</i>	<i>Oats 1000 qtrs</i>	<i>Beans 1000 qtrs</i>	<i>Peas 1000 qtrs</i>
1914 ..	7,804	8,066	20,664	1,120	374
1915 ..	9,240	5,862	22,308	924	300
1916 ..	7,472	6,612	21,334	893	261
1917 ..	8,041	7,185	26,021	474	278
1918 ..	11,648	7,765	31,193	922	440

	<i>Pota- toes 1000 tons</i>	<i>Turnips and Swedes 1000 tons</i>	<i>Mangold 1000 tons</i>	<i>Hay 1000 tons</i>
1914 ..	7,476	24,195	9,523	12,403
1915 ..	7,540	24,431	9,697	12,449
1916 ..	5,469	23,318	9,010	15,198
1917 ..	8,604	24,842	10,369	13,163
1918 ..	9,223	22,835	10,321	12,331

The estimated yield of certain crops in England and Wales in 1919, with comparative figures for 1918, as given by the Board of Agriculture, is shown on the following page.

From the table it will be seen that the yield per acre of wheat was estimated at 28¾ bushels, or 4½ bushels less than in 1918; while the to-

tal production (from a smaller area) amounted to 7,979,000 quarters, which was a reduction of 2,500,000 quarters on the preceding year's total—the highest on record. Despite this decrease, however, and with the exception of 1915 it was the highest since 1898.

Crops	Estimated production		Area		Estimated yield per acre		Average of the 10 years 1909-1918
	1918	1919	1918	1919	1918	1919	
	Quarters	Quarters	Acres	Acres	Bushels	Bushels	
Wheat	10,530,000	7,979,000	2,556,661	2,220,921	32.9	28.7	31.1
Barley	6,080,000	5,476,000	1,500,809	1,509,588	32.4	29.0	31.9
Oats	14,339,000	11,383,000	2,780,061	2,563,628	41.3	35.5	39.4
Mixed grain	620,000	623,000	139,077	142,423	35.7	35.0	
Beans	889,000	854,000	242,097	273,841	29.4	24.9	27.6
Peas	439,000	441,000	127,857	132,212	27.5	26.7	24.8
	Tons	Tons			Cwt.	Cwt.	Cwt.
Seeds, hay <i>a</i>	2,098,000	1,770,000	1,446,504	1,500,933	29.0	23.6	28.9
Meadow hay <i>b</i>	4,688,000	3,425,000	4,298,498	4,170,616	21.8	16.4	22.3

a Hay from clover, sainfoin, and grasses under rotation. *b* Hay from permanent grass

Barley produced 29 bushels to the acre, or 3½ bushels less than in 1918. The total amounted to 5,476,000 quarters, or 600,000 quarters less than in 1918. With the exception of 1915 and 1916, this was the smallest crop since 1885, when official records were first kept.

The yield of oats, while showing a decrease of nearly 3,000,000 quarters when compared with 1918 (which constituted the highest total recorded), was, apart from that exception, the highest since 1907. The comparison with 1918, however, shows a decrease of nearly six bushels per acre. Mixed grain, or dredge, which received separate mention for the first time in 1918, showed a slight increase in the total production. While the area under beans was increased from 242,097 to 273,841 acres, the yield per acre was 4½ bushels less than in 1918. The total production of the hay crops amounted to 5,195,000 tons, which was the smallest since 1893, and approximately only three-fourths of the 1918 crop. While the area for seeds hay (clover, sainfoin, and grasses under rotation) was increased by about 55,000 acres, the yield was nearly 330,000 tons less than in 1918, the yield of 23½ hundredweight per acre being five hundredweight less than in 1918 and the lowest since 1896. Meadow hay, which yielded 16½ hundredweight per acre, was also five hundredweight below 1918, and the lowest since 1901. The acreage under hops was only 7 per cent greater than in 1918, but the yield was 50 per cent greater.

The total of all cattle was 6,195,000, a decrease of about 6000 since 1918. Farm horses showed an increase of 10,000 over 1918; cows in milk a total of 1,944,000, the largest on record, showing an increase of 85,000, or 4½ per cent over 1918. Sheep showed a decline of 8 per cent, the total being 15,123,000, the lowest on record. Breeding ewes declined by over 700,000 (11 per cent), and lambs by over 1,000,000, but older sheep increased by 400,000. Breeding sows totaled just over 250,000, a decline of 13 per cent, which is a little below the 1917 figures, the lowest on record. Other pigs, however, increased by 140,000 (10 per cent), and the total of all pigs was just under 1,800,000, or 6 per cent more than in 1918.

The quantity and value of fish taken from the waters of the United Kingdom in 1918, excluding shell fish, was 431,351 tons, valued at £21,019,100.

MINERAL PRODUCTS. In 1918 the amount of coal produced was 226,699,000 tons; iron ore produced in 1917, 714,845,734 tons. Other minerals of importance are lime-stone, salt, igneous rocks, clay and shale, oil shale, tin ore, etc.

The following information in regard to the effect of the coal strike on output (see below under *History*, and also *STRIKES AND LOCKOUTS*), was reprinted from a British source by the United States Bureau of Foreign and Domestic Commerce:

The effect of the strike on coal output may be gathered from the provisional figures relating to production in that week—2,871,610 tons, as compared with 4,481,434 tons in the preceding week. Thousands of workpeople in the great coal-using trades, such as the pig-iron blast furnaces and iron and steel manufacture, were thrown out of work. The engineering and textile trades were also seriously affected. Some measure of these results of the strike is afforded by the number of claims made under the emergency out-of-work donation scheme, which was in operation from October 1st to 13th. A record was kept of the number of current claims to donation and to unemployment-insurance benefits in Great Britain. On October 1st the number was 540,479; on October 2d, 600,039; on October 3d, 635,764; October 4th, 643,593; October 6th, 662,688; October 7th, 665,878; October 8th, 666,548; October 9th, 676,171; October 10th, 664,371; October 11th, 658,774. These figures compared with a total of 358,440 claims current at September 26th, the day before the strike began, except that this latter figure excludes a relatively small number of claims under the unemployment insurance acts. In addition, 85,000 workpeople were paid under the emergency scheme by their employers. In round numbers it may be taken that not less than 375,000 workpeople were unemployed for varying periods as a result of the railway strike, so far as claims in respect of unemployment are an indication. In addition to these, of course, a considerable number of workpeople were placed on short time.

The weekly returns from August 30th to September 27th throw some light on the effects of the reduction of the working day from eight hours to seven. The reduction came into operation on July 16th, and the output for the week ending July 19th showed a fall of 900,000 tons, as compared with the figure for the previous week. But this comparison is misleading, seeing that the shorter day began in midweek and that its beginning was attended by friction and stoppages in many districts. The returns from August 30th to September 27th represent the output of a more normal period. They give an average weekly output under the 7-hour day of 4,457,321 tons. By comparison with the average output under the 8-hour day from June 14th to July 12th of 4,767,127 tons, this is a fall of

309,806 tons a week, or just under 6.5 per cent.

LABOR CONDITIONS. The following information was supplied by the United States Bureau of Domestic Commerce at the close of the year: Returns issued on December 19th by the British Ministry of Labor disclosed the increasing extent to which wages had been advanced and the reduction that was taking place in the number of working hours. Alterations in the rates of wages which came into operation in November applied to 1,900,000 workpeople, whose weekly wage bill advanced by substantially £480,000 (\$2,335,900, at normal exchange) per week, or about £25,000,000 (\$121,662,500) annually. This increase, it should be noted, was the result of advances granted during the month of November only. During the first 11 months of 1919 5,250,000 of workpeople secured increases aggregating not far short of £2,000,000 (\$9,733,000) weekly, or practically £100,000,000 (\$486,650,000) per annum, the following groups of trades being affected:

Group of trades	Number of work-people	Net increase per week
Building	251,000	£166,000 (\$807,800)
Coal mining	1,110,000	587,000 (2,856,600)
Other mining and quarrying	53,000	27,900 (135,800)
Pig-iron manufacture	31,000	22,300 (108,500)
Iron and steel manufacture	118,000	80,800 (393,200)
Engineering and ship-building	1,329,000	352,800 (1,716,900)
Other metal	328,000	108,600 (528,500)
Textile	475,000	133,200 (618,200)
Clothing	384,000	98,800 (480,800)
Transport (excluding railroad)	262,000	56,600 (275,500)
Printing, paper, etc.	137,000	39,600 (192,700)
Woodworking and furniture	87,000	34,400 (167,400)
Glass, brick, pottery, chemical, etc.	178,000	44,700 (217,500)
Food, drink, and tobacco	174,000	46,600 (226,800)
Gas, electricity, and water supply	77,000	18,300 (89,100)
Other miscellaneous	190,000	53,600 (260,800)
Public utility services	159,000	37,700 (183,500)
Total	5,313,000	1,908,900 (9,289,600)

In November 30,000 workpeople had their hours of labor reduced on an average of three hours each, or 90,000 hours for the month. Changes effected in this respect during the first 11 months of 1919 aggregated 36,211,000 fewer working hours, the number of workpeople affected totaling 5,479,000. In respect to both higher wages and shortened hours of labor there was every prospect of a further expansion and contraction, respectively, in other trades as well as in some of those specifically named above.

WOMEN IN INDUSTRY. The War Cabinet committee on women in industry published its report early in the year. According to this, women occupied in July, 1914, that is, just before the war began, numbered 5,966,000, of whom 2,178,600 were engaged in industry proper and 1,658,000 in domestic service. Of those in industry proper 863,000 were in the textile trades and 612,000 in the clothing, these two groups being the only ones returned as employing more women than men. By July, 1918, the number of occupied women had risen to 7,311,000, an increase of 1,345,000, and the largest increase was in industry, namely, 792,000; whereas in domestic service there had been a decrease of 400,000. The services aside from industry proper which

engaged the greatest number were: Commerce, etc., comprising clerks, shop assistants, etc.; national and local government, including chiefly the civil service; various professional employments including naval, military, and allied services; and transport. The main increase in the industrial group took place in the metal trades and in government establishments. The percentage of women engaged in industry relatively to the total number of work-people rose from 26 per cent to 37 per cent. Down to January, 1918, it was estimated that 704,000 women had directly replaced men in industry. As to wages the pre-war average of women's wages was 13s 6d a week. The average after the war was not determined, but it was estimated that in the metal trades the rate had about doubled by the end of 1918, and the average earnings had about trebled. It was estimated that the average of women's earnings in the whole field of industry proper toward the end of the war was between 30 and 35 shillings a week.

COST OF LIVING. Early in the year important measures were taken to check the increasing cost of living and the policy pursued by the government seemed in the main successful. The chief danger from increased cost of living showed itself among the working class by whom it was believed to be mainly the result of profiteering. It was in fact the chief cause of their discontent. At the industrial conference at Westminster in March, Mr. Thomas, the general secretary of the railway workers, had declared that the purchasing power of the pound sterling was to-day only 10 shillings; in other words, that the cost of living had risen 100 per cent. The wages of the workmen, though they had increased considerably, had not risen in any such proportion. The chief problems before England during the war were, in the first place, the supply of food products, and in the second place, the distribution of this supply. Local production was insufficient and it was necessary to buy abroad, especially in America and the colonies, and to stimulate home production. England purchased abroad enormous quantities of preserved meat, cereals, sugar, etc., accepting all risks of loss by deterioration, or casualty at sea. At the same time she stimulated home production by fixing for a period of five years the maximum price for cereals, thus encouraging the farmers to raise large crops. The ministry of agriculture had the right of exploiting itself any farm that was insufficiently cultivated by its owners. Motor traction machines were introduced on a large scale. In thickly populated neighborhoods tracts of land were requisitioned and rented at a nominal price to men or women who would cultivate them. At the same time no effort was spared that would give these enterprises a patriotic character. The resulting increase of production was prodigious. As to the distribution, the only equitable means was rationing. All essential provisions were rationed and over 30,000,000 coupon books were issued. In order to avoid fraud, the price at which necessities could be sold was fixed. The state, the producer, or the importer, as the case might be, put the product on the English market at a fixed price. The profit of the wholesale and retail dealers was fixed in advance, and the total made up the price paid by the consumer. To simplify the distribution among the merchants, each consumer was obliged to enter his name on the books of a cer-

Total exports	\$2,096,105,484	\$1,872,962,302	\$2,463,810,193	\$2,565,033,583	\$2,440,155,519	\$3,885,282,063

tain tradesman, and he could not purchase his rations elsewhere. Thus there was no freedom of choice among the shops, but that made no difference because prices were the same everywhere. The system was not rigid, but the prices were changed according to the conditions of the moment. There were severe penalties on all who broke the law, and these were enforced without any regard to social differences, rich people, prominent merchants, peers of the realm, etc., being brought to public trial along with the others. Thus in England the prices remained at a reasonable level and were virtually equal for all. In regard to the actual necessities of life, they may be said to have been entirely equal. The only advantage of the rich was that they could purchase certain products that were not subject to rationing, such as game, exotic fruit, etc. During the war it was impossible to obtain even in the best of restaurants, a portion of butcher's meat without a coupon. In certain respects the poor were favored. For example, the ration of manual laborers was higher than that of others.

COMMERCE. During the year 1919 the British imports surpassed those of the preceding year by 24 per cent and the exports surpassed those of the preceding year by 59 per cent. The imports in 1919 were \$7,941,650,421 and the exports \$4,684,954,784. The table (pp. 304-5) shows the value of imports and exports of the United Kingdom from 1914-19 inclusive.

During the nine months ending September, 1919, imports into the United Kingdom from European countries were substantially higher than the year before in all cases except from Norway, Switzerland, and Italy. There were large increases in merchandise imported from Russia, Denmark, Netherlands, Belgium, Greece, and European Turkey, while the colonies of Java and Canary Islands were also conspicuous in this respect. From other foreign countries the returns showed most marked gains in imports from Asiatic Turkey, Persia, China, and Argentina, while considerable increases were recorded in the case of the United States, Mexico, Costa Rica, Venezuela, Ecuador, Brazil, and Uruguay, and smaller gains from many others, but large decreases were recorded against Chile, Philippines, and Guam, Tunis, and Cuba, and a slight decline in the case of Japan.

The British (government) Board of Trade returns for 1919 showed that the exports of cotton manufactures of all kinds from the United Kingdom had an aggregate value of \$1,172,168,700, an increase of \$295,870,350 over 1918 and one of \$462,026,100 over 1917. The increase was attributed entirely to the rise in prices. Exports of cotton piece goods from the United Kingdom last year amounted to 3,528,756,500 yards, compared with 3,699,252,300 yards in 1918, and 4,978,237,900 yards in 1917; but the value was \$870,889,097, against \$674,087,929 in 1918 and \$548,992,384 in 1917, or an average of \$0.247 per yard against \$0.182 and \$0.11 in the two earlier years. In cotton yarn there was not quite the same situation as between 1919 and 1918, for exports in 1919 amounted to 162,665,500 pounds weight, valued at \$165,030,578, contrasted with a weight of 101,711,400 pounds and a value of \$104,090,294 in the year preceding, or an average value in 1919 of \$1.015 contrasted with \$1.023 in 1918. Compared with 1917, however, there was a sharp rise, the 133,151,300 pounds of cotton yarn shipped that year having a total value of \$81,

247,162, and an average value of \$0.61 a pound.

Many plans for the revival of British foreign trade were under discussion during the year. One scheme which was before the public in the beginning of the year proposed the appointment of commissioners familiar with the language, commercial needs, and customs of the respective foreign colonial markets, who should collect and classify trade information, report on the activity of foreign competitors, act for members in a legal capacity, report on the financial responsibility of local houses, on questions of transport, local and labor conditions, etc.

During the summer the restrictions on imports were partly removed, but the permanence of this policy was in doubt, as the government reserved the right to ask for the necessary powers to prevent "dumping." The important question of the relations with Germany was much discussed, and gradually opportunities offered toward resumption of commercial relations. For some time past the public had begun to realize that England ought not to forego her share of trade with Germany. In the newspapers that were regarded as representing the government it was pointed out that Great Britain was now at peace with Germany, and it was said that it was absurd to require England to neglect her interests in German trade, and to insist upon a policy that would cause the economic ruin of Germany. A federation of British industries, in order to obtain for the United Kingdom its fair share of German trade, arranged for an agency at Cologne. It was pointed out that other countries were contending for the main share in German trade, and that England must take measures in her own interest. It was not merely a matter of exporting British products to Germany, for of course it was impossible to sell without buying. In some products Great Britain failed completely. For example, in dye stuffs, it was pointed out that despite the enormous subsidies given by the government to the manufacturers, the cost of certain dyes was almost prohibitory. One of the dye stuffs that the Germans had sold to Great Britain before the war at 7 pence a pound, was now selling at 7s a pound. In spite of the protectionists' insistence that these products should be excluded, no matter what it cost to produce them in England, there was an increasing demand, especially on the part of the textile industries, which needed dye stuffs, for the opening of the market to the Germans.

TRADE WITH GERMANY. In connection with the resumption of British trade with Germany, details were furnished by the president of the Board of Trade showing that during the first 10½ months from the signing of the armistice the United Kingdom exported to Germany goods to the value of over \$80,000,000, and received from Germany imports valued at \$1,087,000. The details of these imports and exports during the period of Nov. 11, 1918, to Oct. 31, 1919, were as follows (values have been converted at the rate of \$5 to the pound sterling):

Imports from Germany to the United Kingdom:

Potash compound (other than manure)	\$268,900
Manures	146,315
Leather, dressed	129,950
Skins and furs, dressed and undressed	108,880
Toys and games	43,155
Other goods	389,945
Total	1,087,175

Exports of produce and manufactures of the United Kingdom to Germany.

Herrings	1,910,550
Potatoes	1,754,365
Provisions, unenumerated	1,087,680
Tobacco and snuff manufactured in the United Kingdom	1,468,090
Linseed oil	8,066,980
Rapeseed oil	1,032,495
Soap	2,402,185
Cotton yarn	2,144,465
Cotton manufactures	18,468,040
Woolen and worsted yarns	1,023,905
Woolen and worsted manufactures	8,662,475
Other goods	6,023,635
Total	53,994,865

Exports of foreign and colonial produce and manufactures from the United Kingdom to Germany

Rice	791,885
Oatmeal and rolled oats	556,715
Lard	2,740,025
Bacon	5,098,345
Meat, preserved otherwise than by salting (including tinned and canned)	3,396,930
Milk (condensed and powder)	2,349,990
Cotton, raw	1,775,925
Jute	782,800
Oils, animal and vegetable	555,270
Rubber, raw	1,872,045
Wool, sheep's or lamb's	307,365
Copper, unwrought	287,500
Cocoa, raw	510,035
Coffee, raw	1,216,255
Sugar	301,485
Tea	205,625
Tobacco	331,815
Other goods	8,963,865
Total	27,043,875

SHIPPING. During the year England kept up its shipbuilding at the rate of 1,800,000 tons a year. Certain centres such as Barry, Maryport, and Workington where work had nearly ceased, resumed their activity. At Newcastle and Hull alone the tonnage turned out increased about two-thirds between Sept. 30, 1918, and Sept. 30, 1919; the works at Liverpool and Glasgow doubled during the same period and those at Belfast, Londonderry, Greenock, Middlesbrough, Stockton, and Whitby increased about one-third.

Figures published by the Steamship Owners' Association early in the year compared the first 12 months ending July 31, 1916, when shipping was still under commercial control, with the 12 months ending July 31, 1918, when it was under state control. In the first period the food imports decreased 4 per cent in weight, and increased 40 per cent in cost over the figures in time of peace; in the second under state control the decrease in weight was 33 per cent; increase in cost was 76 per cent. In the first period imports of raw materials decreased in weight 16 per cent and increased in cost 7; in the second they decreased in weight 31 per cent, and increased in cost 56. In the first period the total ocean-going steamship tonnage available for trade purposes after satisfying military necessities showed a decrease of 22 per cent; in the second, it showed a decrease of 35 per cent. The decrease in weight of imports represented 22 per cent as between the two years in comparison, while the decrease in British tonnage represented only 13 per cent, thus the lack of British tonnage could not account for the falling off. The chief cause assigned for the decrease in supplies and the resulting increase in prices was the failure to retain the service of foreign shipping after 1916. In times of peace about 33 per cent

of the total imports were brought in by foreign vessels. Under commercial control this proportion was nearly maintained. Under state control the proportion fell to below 15 per cent, and the carrying power thus lost represented a weight of about 8,500,000 tons during the year.

RAILWAYS. In 1919 an authoritative estimate stated that there were in Great Britain some 23,500 miles of railway, and reckoned in single track, including the length of sidings, the total mileage in operation was in round figures 55,000 miles. The total length of running track included in this total was over 40,000 miles. Any statistical or commercial discussion of the British railways naturally must be referred to the last year of normal operation prior to the war. Then the number of passenger journeys was approximately 1,233,000,000 which produced a revenue of about £54,250,000. The amount of freight traffic was 372,037,000 tons. The engine mileage of loaded trains was 405,300,000, and the switching mileage 137,865,000, the total engine mileage, including the haulage of empty trains, being 628,324,000.

In this connection there were made available in 1919 figures for the revenue and expenditure of the railways of Great Britain and Ireland for the years 1916, 1917, and 1918. These showed that the average rate of dividend in 1918, 3.70 per cent for the first time during the war exceeded the 1913 average of 3.63 per cent. The total receipts again increased, but the per cent of expenses was greater than in the previous year (the proportion in 1914 was 63 per cent):

	1916	1917	1918
Total receipts, thousands	£154,468	£168,721	£197,293
Expenditure, thousands	102,520	115,994	143,342
Net income	51,948	52,727	53,951
Per cent of expenses	66	69	73

Aside from strike troubles and readjustments to peace conditions there were few important developments to record in the British railways outside of the creation of the Ministry of Transport which is discussed elsewhere. In November the North-Eastern decided to convert from steam to electric operation its main line between York and Newcastle, a distance of 80 miles, and the loop line between Northallerton and Ferryhill via Stockton, a distance of 31 miles. Inasmuch as the North-Eastern used these lines exclusively the situation was not complicated by the consideration of other traffic. The decision was important as there was a very heavy and varied traffic, ranging from East Coast and other important through trains to local freights on the two sections in question. The new plan was a radical departure as the previous experience of this company with electric traction has been confined to the working of a dense local passenger traffic on Tyneside, between Newcastle, North Shields, Tynemouth and Whitley Bay, and of the coal traffic between Shildon and Newport (Middlesbrough). Furthermore no other company in Great Britain had, however, experimented with the electric haulage of freight trains. On Tyneside the third rail system is in use, but between Shildon and Newport overhead electrical equipment was adopted. The new proposal which involved the use of electric locomotives was a combination of the third rail and overhead systems. The general scheme was that the former should be used on the running lines, and the latter

adopted in the freight yards and at large stations.

This was not the only proposal for electrification for Sir Eric Geddes in the debate on the Electricity Bill stated that the Midland, Great Eastern, South-Eastern and Chatham, and the London, Brighton, and South Coast railways were among the companies that had schemes of electrification.

In Great Britain as in Germany there was a tendency to transform munitions plants for the manufacture of locomotives and other rolling stock. One of the most important of these plants was the Sir W. G. Armstrong, Whitworth, & Co., Ltd., Scotswood works, where the first locomotive built was tested on November 12th. This engine was a large main line 0-8-0 super-heater locomotive with a 6-wheel tender for the North Eastern. At the date of the armistice the Scotswood works were entirely devoted to the production of munitions, the output of the plant during the period of hostilities reaching the total of 14,500,000 shells, in addition to vast numbers of cartridge cases, fuses, etc. After re-organizing and equipping the shops for locomotive manufacture it was reported that this plant would employ 3000 men and could produce one finished locomotive per day.

FINANCE. In the years ending March 31st, revenue (receipts into the exchequer) and expenditure (issues out of the exchequer, chargeable against revenue) have been as follows in thousands of pounds sterling:

	1916	1917	1918	1919
Revenue	336,767	573,428	707,235	889,021
Expenditure	1,559,158	2,198,113	2,696,221	2,579,301

On April 30th the budget estimates for 1919-20 were presented to the House of Commons by Mr. Chamberlain, as follows: Expenditure, £1,434,910,000; estimated revenue, £1,159,650,000; the balance to be covered by bonds, £275,260,000. Among the features of the budget may be mentioned the following: Preference on certain imports from the colonies and dominions; increase of duties on spirits and beer; reduction of excess profits duties; retention of the income tax rates of the previous budget; increase of death duties on estates exceeding £15,000; and the abandonment of the luxury duty. Of these the most important feature was the provision for imperial preference. On March 31, 1919, the debt stood at £7,235,000,000 as compared with £645,000,000 at the outbreak of the war.

On February 1st the national debt including floating debt was officially reported at £7,334,000,000. The debt on April 1st of the five preceding years was as follows: 1914, £707,654,110; 1915, £1,155,801,702; 1916, £2,197,439,245; 1917, £4,063,644,981; 1918, £5,921,095,819.

Mr. Austen Chamberlain, Chancellor of the Exchequer, submitted his proposals for the balancing of the budget on October 27th. Estimated revenue, 1919-20: £806,000,000, including £460,000,000 from inland revenue; £290,000,000 from customs and excise; £43,000,000 from the Post Office; and £13,000,000 from other sources. Estimated expenditure: £373,000,000 for consolidated fund charges, that is to say, for the service of the public debt; £135,000,000 for the fighting forces; £246,600,000 for the civil services; and £53,400,000 for the revenue services.

Estimated expenses, 1919-20: £1,642,295,000 or an excess of £191,195,000 over the budget estimate. As the revenue was estimated at £1,168,650,000 or £32,450,000 less than the budget estimate, the total deficit was brought to £473,645,000. The debt to the United States at the end of March, 1920, was estimated at £842,000,000. The amount owed to Great Britain by her Allies on that date was estimated at £1,740,000,000. Army expenditures for the financial year, 1919-20, were estimated at £500,000,000 instead of the £440,000,000 of the original estimate. Receipts from the sale of materials and from German payments for the army of occupation amounted to £95,000,000 leaving a net total expenditure of £405,000,000. This was an increase over the original estimates by £118,000,000.

ARMY. The number of discharged and demobilized down to February 18th was given as 36,942 officers and 1,478,801 men, or a total of 1,515,743. The following figures showing the casualties in the flying service during the war were published early in 1919.

	Killed	Wounded	Missing, including prisoners	Interned	Total
Officers	4,579	5,369	2,794	45	12,787
Other ranks	1,587	1,876	334	39	3,836
Total	6,166	7,245	3,128	84	16,623

At the end of January were published the plans for the future army. By these some 900,000 men were to be retained. When the armistice was signed in 1918 the officers and men of the British army numbered about 3,500,000. Some 2,500,000 before the end of January had been released, and of these about three-fourths had already been demobilized. On November 11th, the Royal Air Force numbered about 30,000 officers and 265,000 men of whom 1742 officers and 51,727 men had been demobilized by January 24th. The plan for the future army contemplated the retention during the year 1919 of about 6500 officers and 75,000 men. It was provided that the new army should consist in the first place only of those who had not enlisted before Jan. 1, 1916, and who were not over 37 years of age. If this method of selecting resulted in bringing to the colors more than 900,000 men, the age limit was to be reduced. It was provided that the divisions which remained to the end should be brought home as units. Increase of pay for the armies of occupation was provided, the total extra cost for one year being estimated as £29,000,000. The armies of occupation were to include the home army, army of the Rhine, army of the middle East, detachment of the far North, and garrisons of the Crown colonies and India. It was provided that soldiers under 26 years of age should serve only at home or in the army of the Rhine. During the early months of the year demobilization was rapidly going on. Down to January 30th for example, 1,033,514 had been demobilized from all three forces, the army, the navy, and the air forces. This tended to increase unemployment which was becoming at that time a serious menace.

The army estimates issued at the beginning of March showed that for the services of 1919-20 the total estimate was £287,000,000. At this time the minimum strength of the army after the war was placed at 952,000.

GOVERNMENT. The ministry at the beginning of 1919 was constituted as follows: Prime Minister and First Lord of the Treasury, D. Lloyd George; Lord President of the Council and Leader of the House of Lords, Earl Curzon; Lord Privy Seal and Leader of the House of Commons, A. Bonar Law; Chancellor of the Exchequer, Austen Chamberlain; Minister without Portfolio, G. N. Barnes; Minister without Portfolio, Sir Eric Geddes; Lord Chancellor, Lord Birkenhead; Secretary of State for Home Affairs, Edward Shortt; Secretary of State for Foreign Affairs, Arthur J. Balfour; Secretary of State for Colonies, Viscount Milner; Secretary of State for War and Secretary of State for Royal Air Force, Winston Churchill; Secretary of State for India, E. S. Montagu; Vice-President of the Air Council, Major-General Seely; President of Local Government Board, C. Addison; President of Board of Trade, Sir Arthur Stanley; Minister of Labor, Sir R. S. Horne; First Lord of the Admiralty, Walter Long; Minister of Munitions (later, Minister of Supply), Lord Inverforth; Minister of Food Control, G. H. Roberts; Minister of Shipping, Sir Joseph Maclay; President of the Board of Agriculture, Lord Ernle; President of the Board of Education, H. A. L. Fisher; First Commissioner of Works, Sir Alfred Mond; Chancellor of Duchy of Lancaster, Earl of Crawford and Balcarres; Postmaster-General, Albert H. Illingworth; Minister of Pensions, Sir L. Worthington Evans; Minister of National Service and Reconstruction, —; Attorney-General, Sir Gordon Hewart; Solicitor-General, Sir Ernest Pollock; Paymaster-General, Sir J. Compton-Rickett; Secretary for Scotland, R. Munro; Lord Advocate, J. A. Clyde; Solicitor-General for Scotland, T. B. Morrison; Lord-Lieutenant of Ireland, Viscount French; Lord Chancellor of Ireland, H. M. Campbell; Chief Secretary of Ireland, J. I. Macpherson; Attorney-General for Ireland, Arthur W. Samuels; Solicitor-General for Ireland, Denis S. Henry.

The principal members of the ministry in November were as follows: Prime Minister and First Lord of the Treasury, David Lloyd George; Minister Without Portfolio, G. N. Barnes; Lord President of the Council and Leader of the House of Lords, Arthur J. Balfour; Chancellor of the Exchequer, Austen Chamberlain; Lord Chancellor, Lord Birkenhead; Lord Privy Seal and Leader of the House of Commons, A. Bonar Law; Secretary for Home Affairs, Edward Shortt; Secretary for Foreign Affairs, Earl Curzon; Secretary for Colonies, Viscount Milner; Secretary for War, Winston S. Churchill; Secretary for India, E. S. Montagu; President Board Trade, Sir Auckland Geddes; Minister of Labor, Sir R. S. Horne; First Lord of the Admiralty, Walter Long; Minister of Transport, Sir Eric Geddes; President Board of Agriculture, Lord Lee; President Board Education, H. A. L. Fisher; Secretary for Scotland, R. Munro; Lord Lieutenant of Ireland, Viscount French; Chief Secretary for Ireland, J. I. Macpherson. See **AGRICULTURAL EXPERIMENT STATIONS; AGRICULTURE; ARBITRATION AND CONCILIATION; BIRTH CONTROL; COÖPERATION; EXPOSITIONS; FINANCIAL REVIEW; WAR FINANCE; HOUSING; INDUSTRIAL RECONSTRUCTION; MINIMUM WAGE; NAVAL PROGRESS; OCCUPATIONAL DISEASES; SOCIAL HYGIENE; STRIKES AND LOCKOUTS; TRADE UNIONS; UNEMPLOYMENT.**

HISTORY

IRELAND: THE REPUBLICAN MOVEMENT. As noted in the preceding YEAR BOOK the Sinn Feiners practically overthrew the Nationalists in the general elections of December, 1918. It had been resolved, however, that Sinn Feiners elected to Parliament should not take their seats but should confine themselves to agitating for a separate government. Accordingly, they held a conference at Dublin, January 21st, where a declaration of independence was adopted and where the so-called Provisional Government of the Irish Republic was proclaimed. This body sent Mr. J. Y. O'Kelly a Sinn Fein member of Parliament to Paris from Dublin as its representative, and the celebrated Sinn Fein leader Mr. Eamonn de Valera (a former member of Parliament), Count Plunkett, and Mr. Arthur Griffith were appointed to present an appeal on behalf of Ireland at the Conference. Mr. de Valera had escaped with other Sinn Fein leaders from Lincoln jail on February 4th. Serious disturbances took place during April including strikes at Dublin and Limerick which threatened to take the form of a revolt against the military and as a result martial law was proclaimed at Limerick, Cork, and Tipperary. From that time on to the close of the year Ireland was under a strictly military régime. Mr. de Valera represented the extremists and his views as expressed in February in the course of an interview illustrated the temper of that numerous element in the country. He said that if the Paris Conference failed to take steps to allow self-determination for Ireland, violence would be the only recourse left to Irish patriots; in short it would mean practically a continued revolution until Ireland's rights were recognized; and he added that he believed every man in Ireland would be willing to back up the demands of the Sinn Feiners when they were made and that his party had effected the organization of the country and was able at a moment's notice to take over the administration.

In the United States the Irish Americans were sympathetic with this extreme wing and took action on their behalf. On February 23d an Irish convention, which was held in Philadelphia, appointed three American delegates (Messrs. Walsh, Ryan, and Dunne), to be present at the Peace Conference and request that Irish independence be granted and they conferred on the subject with President Wilson on March 17th. It was expected that Mr. Lloyd George would receive them but their presence in England occasioned so many marks of hostility toward the government that he finally refused. They depicted in dark colors the conditions in Ireland under British rule. This naturally brought prompt denial from the Government. They were received with great enthusiasm early in May and left Dublin May 12th. The Unionist press commenting on the affair declared that this delegation had done more political harm in the course of a week than British statesmanship could hope to undo in months. Meanwhile the Irish delegates to the Peace Conference had been demanding passports from the British government and an appeal had been made to the American government. Finally on May 27th the American government through Mr. Lansing gave notice that the American representatives could

not take any further steps toward securing the passports. In June Mr. de Valera arrived in the United States, receiving an extraordinary welcome in various parts of the country from Irish-Americans and their sympathizers, being received in crowded halls in many cities and frequently hailed as the President of Ireland.

The perplexity over the Irish question on the part of British authorities was illustrated by the following summary of the views of certain Unionist papers. Any solution that was offered, they said, would immediately alienate a large body of Irish. For example it was proposed that some form of Home Rule should be bestowed upon an undivided Ireland but no form of Home Rule that had as yet been considered would avoid the bitter opposition of the Sinn Feiners. It was not certain that even the Nationalists would now accept Home Rule as it had been formerly understood. Again it was proposed that there should be Home Rule in the southwest while the northeastern part should remain under the Government of Great Britain; but the extreme parties in Ireland would not accept any such compromise and it was not accepted even by the Nationalists. It seemed therefore that to satisfy the Irish majority the Government would have to go at least so far as to accept the proposals which had been defeated at the Irish Convention. If it did this, however, it would immediately offend Ulster which showed a temper of resolute resistance, and the Government had promised not to coerce Ulster. The bringing of moral pressure to bear as proposed by Sir Horace Plunkett seemed decidedly difficult in the present state of public temper. The Nationalists had proposed that the League of Nations should be the instrument for the exertion of moral pressure on behalf of Ireland. The other political parties, however, refused to believe that the British government would invoke the aid of the League of Nations in its domestic affairs. Thus there were three distinct forces, one of which would be directed against any settlement that was undertaken.

IRELAND: POLITICAL UNREST. The movement towards an independent republic was checked by the threat of military suppression. The number of British troops was increased to over 100,000 and although it was reduced subsequently Ireland remained virtually under military occupation throughout the year. At the end of it Lord French was still acting as military viceroy. On December 19th, an attempt was made to kill him in Phoenix Park, Dublin, as he was passing through in an armored automobile. This unsuccessful attempt was only one of the many crimes and attempted crimes reported toward the close of the year, including the killing of policemen for trying to enforce the law and various other attacks upon the constituted authorities. The constabulary and troops made counter-raids upon the Sinn Feiners especially in county Cork, where a considerable amount of farm property was destroyed. The repressive policy of the government which included the suspension of jury trial, the extension of rights of search and the suppression of free speech and association, led to frequent manifestations of public discontent. To the supporters of the government these acts of violence seemed to prove the need of a firm policy and the use of armed forces as the only way

of dealing with the Irish question. The enemies of the government however believed that it proved that armed force was precisely the means that ought not to be employed, for they held that this spirit of revolt was the direct result of it and would continue so long as the government continued its so-called policy of firmness. The causes of discontent seemed to be wholly political for the country was more prosperous than it had been in generations, and for the first time in 70 years the population was reported to be increasing.

IRELAND: THE GOVERNMENT'S PLAN. During the latter months of the year it was known that the ministry was at work upon a new plan for the settlement of the Irish difficulty. The features of it were announced three days after the attempted assassination of Lord French. Among the essential points in the proposal as submitted by Mr. Lloyd George was the setting up of two Irish parliaments; one for Ulster and the other for the rest of the country. Between these two separate legislatures there was to be a bridge, consisting of a consultative council. This Council of Ireland was to consist of 20 representatives elected by each of the legislatures. There was conferred upon it at the outset the power of passing private laws but other powers might be conferred upon it by the two legislatures at their discretion. The two legislatures were to possess full constituent powers so that they might if they wished create a single Irish parliament for the whole country. The new plan offered Ireland complete control over a wide domain regarded as local, including agriculture, land, transportation, roads, bridges, hospitals, etc. The Imperial Parliament of Great Britain retained control of the army and navy, post-office, customs and excise, income tax, excess taxes, etc. The Irish legislatures were vested with all powers not specifically reserved to the Imperial Parliament. Ireland was to contribute a fixed sum to the Imperial Treasury and she was to retain her representation in the British Parliament. To many persons this seemed a just solution of the problem. A large number of the moderate papers of the United States declared that it was all that could be reasonably demanded. Nevertheless it was entirely inconsistent with the principles of what seemed to be the majority of Irish people and many of its features had been expressly condemned in advance. Among the difficulties with the plan was the long-standing one which for many years had been discussed without bringing a solution: Ulster preferred to remain under English rule. Again, the rest of Ireland was not united in its demands, one party insisting upon independence and the other on mere self-government. Not only was Ulster opposed to the independence claimed by the Sinn Feiners, but the Catholics themselves were divided in regard to it. There was a threefold or fourfold division. In the first place England would not consent to independence; in the second place Ulster was opposed to any measure of self-government that would leave her a helpless minority under hostile rule; in the third place there was the strong and according to some the predominant element of the people, the Sinn Feiners, who wished to set up an independent republic; in the fourth place there were the partisans of self-government as represented by the Irish Dominion League presided over by Sir Horace

Plunkett who wished Ireland to form a dominion of the British Empire, like Canada. Moreover Ulster refused to entrust her destiny to the other provinces which formed the majority and these provinces on the other hand denied to the Irish of Ulster the right to break up the unity of Ireland and to disregard the wishes of the majority. This state of affairs accounted for the difficulty in foreign countries of coming to an opinion on the subject. It seemed impossible to offer a simple solution like that of independence or self-government in view of the fact that the Irish themselves were not agreed upon it. It was pointed out that if, for example, Great Britain should at once bestow independence upon the Irish republic and grant everything that the Sinn Feiners demanded there would immediately be as a result of this generosity a civil war in Ireland. This policy of separation, however, was one that the government had committed itself against. Mr. Lloyd George had declared that Great Britain would never accept separation and asserted that any one who thought of this as a practical solution was ignorant of the history of the last five years. The course of Ireland during the war was used in fact as an argument by each party to the controversy. On the one hand the friends of independence argued that Ireland had shown so deep a hostility to Great Britain that the continued forcing of her into any kind of a union would be fatal—in short that Ireland would always be a thorn in the side of England until the wishes of the Sinn Feiners were realized. On the other hand the Unionists and those who demanded merely self-government pointed to the history of Ireland during the war as showing the great danger of a free Ireland as a neighbor for England for she might enter into alliances with England's enemies. During the war she had shown a readiness to form such alliances at the time of England's greatest peril. The attempt of Sir Roger Casement was an illustration of this. French comment on the subject recurred constantly to this point. "Whose fault is it," they asked, "if England considers the independence of Ireland a grave economic and military danger?" The attitude of the Irish Nationalists during the war and the threats of the Sinn Feiners gave England reason to believe that the invasion of England was possible with the consent and support of the Irish. In France where there had always been warm sympathy with Ireland, feelings had decidedly cooled as a result of Ireland's course during the war. France at that time was fighting for her national existence. At the very moment of crisis a large portion of the Irish people had supported the enemy of France. It was understood that a certain number of Irishmen were fighting in the British ranks but the Irish nationality as a whole was believed in France to have been pro-German. It was said that the Irish not content with embarrassing their English allies had actually supported the Germans. If Ireland had consented to lay aside her grievances during the war and had applied herself solely to gaining the victory for the Allies the sentiments of Frenchmen would have been different.

As to Irish opinion the plan was denounced by prominent Sinn Feiners and even by moderate Nationalists. To the proposed arrangement in regard to Ulster the nationalistic element in Ireland had already declared its opposition, and

such comments as appeared from them down to the close of the year indicated a profound dissatisfaction. The Irish economist Mr. George Russell said: "There is nothing in the proposals calculated to produce reconciliation, and there is no reason why the Sinn Fein should cease working for the destruction of the British Empire. Under Lloyd George's proposals Great Britain would retain complete control over taxation and the trade policy and economic development of Ireland, which means that Ireland would be given, not self-government, but certain administrative powers." Sir Horace Plunkett had already condemned the plan for a consultative council as designed merely to serve the interests of "the Castle" and he protested against determining the whole question of Ireland's future at Westminster without giving the Irish a voice in the matter. While the Ministry was engaged on the plan, he pointed to the fact that the Irish people had no hand in framing the government which they were to work and had not the faintest idea what it was going to be. In general the criticism of it from the nationalistic point of view was that it did not recognize the principle of self-determination or bestow anything approaching the degree of independence demanded by the Irish people.

The friends of the Irish Republic were not all in sympathy with the purposes of the Sinn Fein as was illustrated by the views expressed by Colonel Arthur Lynch who made an address in New York City on December 30th. In his view the physical force for setting up a republic was inadequate. He condemned the policy of Lord French as comparable to the German occupation of Belgium and predicted further outbreaks of violence if the military rule of Ireland continued. But as to the Sinn Fein methods he did not believe they could succeed if they showed no other thought than mere violence and rebellion nor could a solution be found that was not fair to Ulster. Moreover the religious element had entered in and added a spirit of bigotry. There were practically no Protestants at all among the Sinn Feiners. Finally the Sinn Feiners had made a mistake in not having made common cause with the Labor party of Great Britain. Colonel Lynch had been one of the Irish Nationalists who had fought on the side of Boers and he was afterwards a member of Parliament. He believed that a republic in Ireland could not be set up unless republics were set up also in South Africa, Australia, Canada and even in Great Britain itself.

THE PARLIAMENTARY SESSION: SUMMARY. The traditional party lines had been more or less obliterated before the meeting of Parliament, on account of the appearance of new forces. In the first place the Coalition had overriden the old divisions, and the increased strength of the labor representation gave the final blow to the Victorian party system, which had been steadily undermined during the war as one Coalition government succeeded another. The government of Lloyd George during the year rested upon the support of the Unionists and some of the Liberals. There was no considerable opposition, for the Labor element was not strong enough to assume that position though it promised to do so in the future. Gradually a new kind of opposition arose in that Parliament as a whole showed a will of its own as

against the government. During the autumn sittings this critical spirit was in full swing. The House of Commons served as a definite check upon the government and it was pointed out that never before had the ministry been so susceptible to its views. At the beginning of the session the government announced a vast programme of legislation for social and industrial reconstruction and since this could not be carried out under the old complicated methods, it asked the House to remove the hindrances to legislation. The principal change accepted by the House was the removal of the committee stage of bills before the House from committees of the whole to standing committees. At the end of the session the King's assent was given to 45 acts but in spite of their number they did not include some of the most important measures in the government's programme. The Anti-Dumping bill provoked a Liberal revolt and failed to pass. The coal industry bill also failed. Three important Labor measures, namely, for a national minimum wage, a universal 48-hour week, and a general system of unemployment insurance, were held over until the next session. No decision whatsoever was reached on a plan for the future government of Ireland (see paragraphs on *Ireland*). On the other hand two Housing acts were passed; measures were carried for the settlement of ex-soldiers on the land and for the facilitation and acquisition of land for public purposes; new ministries of health and transportation were created; and an Electricity Supply act was passed. At the beginning of the year danger was threatened from the extremists in the labor element who began a campaign of direct action in the first months of the year. As time went on, however, the spirit of moderation among the great masses became manifest. Conditions in the coal industry reached an alarming stage at the very beginning of the year and continued to cause anxiety throughout the summer. The railway strike at the close of September also caused much apprehension. The government reached a satisfactory solution in the latter case but the questions at issue in the former were still unsettled at the close of the year. (See paragraphs on *Labor Difficulties*.) In the autumn sittings the hold of the government on the House was plainly weakened. The House had made changes so radical in government measures that in their final form they were unrecognizable. This was especially noticeable in the Aliens Restriction bill of which the standing committee greatly extended the scope. When called upon by the government to adhere to its original programme the House refused to undo the work of the standing committee. On December 23d the House of Commons was prorogued to February 10th, the session being officially closed by a speech from the throne. In this reference was made to the ratification of the treaty and the hope expressed that other treaties would soon be concluded. It also expressed regret at the condition of Russia; reviewed the serious economic situation of Europe; mentioned the need of popular legislation especially in regard to the relation between labor and capital; and pointed to the necessity of taking measures to reduce the national debt. Thus ended the session of the first Peace Parliament. Certain features of it are described in further detail in succeeding paragraphs.

THE NEW PARLIAMENT. The first meeting of the new Parliament was held on February 4th. The complexion of the House was completely transformed as the result of the overwhelming changes in the preceding general election. Out of the four acknowledged party leaders in the previous Parliament three had lost their seats, namely, Mr. Asquith, Mr. Henderson, and Mr. Dillon, and there were no Irish Nationalists in their places although seven of them had been re-elected. A large number of the new members were present. One marked change in personnel was the virtual absence of men in military uniform in contrast to the preceding Parliament. The first act of the new House was the choice of speaker and Mr. Lowther was elected to the post.

In the Prime Minister's address a number of points may be mentioned, as affording a key to subsequent discussions of policy. He pointed out that detailed explanation of what was going on at the Peace Conference was impossible. This Conference was settling questions involving every continent in the world, and represented over 30 nations. In regard to the punishment of those who were responsible for the war a commission had been appointed representing all the great Powers, which would deal with the responsibilities not merely of those who initiated the war, but of those who had been guilty of atrocities. As to the indemnity, that also had been referred to a commission which comprised the ablest representatives of the countries concerned. The more important portion of his address dealt with labor difficulties. The unrest among the laboring classes in England could not be denied, and it had reached serious proportions. In the first place there were special war conditions which conduced to it, as for example, the strain of war upon labor. Then there was a great fear of a lack of employment. In addition to that certain social conditions aroused the discontent and even anger of the working classes, and especially the better educated among them. Thus there were bad housing and a disgraceful degree of over-crowding in certain regions. The government was already doing its best to remove difficulties in individual trades in regard to hours of work and wages; for example, in trades affecting three million of the working people agreements had already been made in regard to hours of labor, and in trades affecting another two million negotiations were still pending. Parliament was pledged to improve working conditions and it must redeem that pledge. Bills would be introduced at an early date to deal with housing, health, development of the transport system, land settlement, etc. As to unemployment Mr. Lloyd George did not believe that any such deficiency of profitable employment would result, as for example in Russia, for the burdens had borne upon all classes and not merely upon one. There was at present plenty of opportunity for employment if all classes acted with restraint. There were great arrears in various industries, as for example in the railways, in textiles, in ships, in furniture, in building. One of the first means of restoring industry was the promotion of confidence; then the cost of production must be kept within reasonable bounds, for if it reduced the purchasing power of the community as a whole, it would mean unemployment. Therefore no one individual trade could be con-

sidered without reference to others. Before the war England had exported some £1,000,000,000 worth of goods, and it was computed that half of that was wages. Now this enormous trade was largely conducted on a narrow margin, and a little change one way or the other would have turned it over to some foreign competitor. The addition of 4s. a ton on coal for example might deprive England of half of her trade. The effect upon employment of such a result was manifest. He protested against the idea that there was an inexhaustible reservoir of profit. For example, the railways were making at the beginning of the war a profit of £50,000,000, which produced a dividend of less than 4 per cent, but since the war, owing to increases in wages, the cutting down of the hours of labor, increased cost of material, and other reasons, some £90,000,000 had been added to the cost of running the railways. Now this could come from only one source and that was the consumer; hence, it would be mainly paid by the third class passengers and by the shippers. The theory that employment could be provided by reducing the hours of labor, if carried too far, became absurd. For in that case it tended to cause unemployment all over the country since it increased the cost of a particular commodity, which as it entered into the production of some other commodity tended to diminish the latter, assuming that the amount of available capital remained the same. As to the serious forms of unrest there was a dangerous movement tending to undermine confidence in trade union leaders. This was dangerous because it had resulted in a lack of discipline and made it impossible to deal with the trade union as a responsible body. This apparently was instigated by those who had an interest in causing anarchy. He declared that the government was bound to examine fairly and carefully every demand that was put forward by any body of workmen, but that the government would not admit demands which tended to overthrow the existing order, relying simply upon brute force. It took its stand on the principle that Prussianism in the industrial world must be fought as well as in the political. The government would fight against any unfair bargain, whether it was demanded by employees or employers.

The labor question was brought up early in the session of the new Parliament. On February 13th a resolution was introduced by the Labor party regarding the absence from the King's speech of any definite proposal for the relief of the industrial unrest. There was a debate on the subject in which the following points were brought out. It was said that the working-men, especially the miners, had just grounds of complaint. Their representatives declared themselves hostile to Bolsheviks and profiteers alike, but they insisted that remedial measures should be taken. The secretary of the railway men, Mr. J. H. Thomas, urged the government to put the Whitley report into immediate effect, and to insist on full publicity in all disputes. He called upon the government to deal with the reactionaries as it would deal with the Bolsheviks, and he warned the employing class that the working classes could no longer be treated as mere beasts of burden. He declared that within the next few months the situation would be dangerous. The government argued that it had taken a great step in ad-

vance by giving the eight-hour day to the railway men, and said that agreements in respect to the hours of labor had been made applying to over 3,500,000 men. If the people were reasonable there was no danger of serious unemployment. The chief perils were the lack of credit in business, and the fear of undertaking new enterprises.
